Subject/Object data were analyzed using *A Guide to the Subject-Object Interview: Its Administration and Interpretation (*Lahey et al., 1988*).* It is used to score bits of cognitive structure underlying meaning making. Due to its uniqueness, it has its own specific protocols for being administered and analyzed. DeLauer and Popp analyzed the Subject Object data. The three themes described in Phase 1 were cross-analyzed with the subject-object scores to uncover distinctions of meaning-making among all participants.

Results

SeaPlan participants generally understood the EBM concept and described it in similar ways using similar terminology. However, how they made sense of its implementation and their role and others' roles within it differed substantially among participants. For example, some participants wanted to have joint ownership of decisions made through Partnership discussions. Others wanted to defer to a selected governing body. Some believed consensus was crucial for success. Others didn't think consensus was possible nor did they feel it was important. Some saw SeaPlan as a safe meeting place to hash out individual differences. Others saw it as an ill-defined mechanism that worked better in theory than in practice. Such wildly different perspectives among participants called to attention the differences in how they made sense of the directives of SeaPlan. We explored whether these were merely differences in opinion or fundamental differences about the very way in which participants understood the task at hand.

The following is a chart that summarizes the mindset of each research participant. These mindsets are previously described in this paper. These mindsets are not value judgments about participants; they are characteristics of how individuals made meaning of SeaPlan and EBM.

- Socialized
- Socialized with some Self-authoring

- Socialized (Dominant) and Self-authoring
- Self –authoring (Dominant) and Socialized
- Self-authoring with some Socialized
- Self-Authoring
- Self-Authoring with Self-transforming

Key:
Socialized Mind = 3
Transitional between Socialized and Self-authoring = 3/4 or 4/3
Self-Authoring = 4
With Transforming Mind = 4(5)

Table 1: Chart of Mindset Scores

Participant	**Mindset**	**Age**	**Education**	**Gender**
One	3/4	34	PhD	F
Two	4(3) - 4	56	MS	M
Three	3	33	MS	M
Four	4	51	PhD	M
Five	4-4(5)	64	PhD	M
Six	3	33	MS	F
Seven	4	54	PhD	M
Eight	4	52	PhD	F
Nine	4-4(5)	49	MS	F
Ten	4/3	49	PhD	M
Eleven	4-4(5)	54	PhD	M
Twelve	4/3	37	PhD	M
Thirteen	3/4 - 4/3	54	PhD	M
Fourteen	3	56	BS	M
Fifteen	4-4(5)	50	PhD	M
Sixteen	4	N/A	PhD	F
Seventeen	4	72	PhD	M
Eighteen	4	66	MS	M
Nineteen	3/4 - 4/3	46	MS	F
Twenty	3-3(4)	40	MS	M
Twenty-One	4	54	MS	M
Twenty-Two	3(4)	43	BS	F

Next, we discuss the significant findings related to the theme of *perspective-taking*. See DeLauer, 2009 to read about the other significant findings.

Discussion

The theme *perspective-taking* was broken down into four sub-themes. These sub-themes resulted from the coding process described above. Once themes were identified through the qualitative coding process, they were examined by mindset for each participant. The sub-themes are Connection to Affiliation, Self-authoring, Capacity for Self-reflection, and Perspective of other. Each is analyzed below by mindset.

The following is one of the more prominent definitions of marine EBM:

> Ecosystem-based management is an integrated approach to management that considers the entire ecosystem. The goal of ecosystem-based management is to maintain an ecosystem in a healthy, productive and resilient condition so that it can provide the services humans want and need. Ecosystem-based management differs from current approaches that usually focus on a single species, sector, activity or concern; it considers the cumulative impacts of different sectors. (McLeod et al., 2005)

By breaking down these sentences, one discovers additional meaning inherent in the definition. “Ecosystem-based management is an integrated approach to management that considers the entire ecosystem.” Underlying this sentence is the sentiment that the human perspective of coastal oceans must be broadened. “The goal of ecosystem-based management is to maintain an ecosystem in a healthy, productive and resilient condition so that it can provide the services humans want and need.” Underlying this sentence is the perspective that it is a responsibility to conserve and sustain ecological value in order for humans to continue to benefit from ecosystems. “Ecosystem-based management differs from current approaches that usually focus on a single species, sector, activity or concern; it considers the cumulative impacts of different sectors.” Implicit in this sentence is the need for dialogue and deliberation among sectors and reflection within sectors about impacts to ecosystem goods and services. As the terminology used to describe EBM is broken down, more explicit meanings emerge. In short, the definition of EBM is calling for decision-makers to take and hold three perspectives at the same time: a holistic perspective on the marine environment, an introspective perspective on one’s responsibility to it, and a reflective perspective on one’s actions and interactions in relation to others during decision-making.

Sub-theme 1: Connection to Affiliation

The following are excerpts from participants who saw the relationship between their professional affiliation and SeaPlan in unique ways. These excerpts were primarily responses to questions asked during the EBM interview. Each mindset is discussed separately.

Socialized Mind. Participants exhibiting a predominant Socialized mindset came to their perspectives about SeaPlan and their roles within it largely through the authority of their professional affiliations. These affiliations were with their organization or agency or another person, usually someone whom they regarded as an expert on the subject. Others came to SeaPlan because of their affiliations, but the difference was in the ways they “held” their affiliation, i.e. how identified they were with it and how they made sense of it. Here is one participant’s response to the question about why she was engaging in this process.

> I think just because I serve more of a coordinating role in the region and can have a good sense, a good bird’s eye sense of what (my affiliation) can bring to the table and also sort of high-level politics that might be brought to their partnership in a positive light, and also

> because, well (Personal affiliation) asked me and she is one of my all time favorite mentors so the bottom line is that is why I did it. But, I think the reason why she asked me is because of my multi-faceted role within (my affiliation) in the region and sort of what I represent there.

"Because I was asked" and personal affiliation to someone involved were both important reasons to participate.

These participants talked about acting from a need not to be excluded from something perceived as influential. The thought of exclusion led to a fear that one's affiliation and consequently, one's self would be the victim of changes in marine policy. "You're either at the table, or on the menu," said one participant. There was a sense that one's role in a process like SeaPlan was to ensure there was inclusivity, specifically of one's particular affiliation. The need for equality was a strong value for those with a Socialized mindset. They needed to feel that in exchange for their participation, others would reciprocate by considering their interest. SeaPlan and EBM-type processes were something they join or get on board with; these processes were a new kind of affiliation. However, they must first trust that their interest was being heard and accepted by others in order to consider something an affiliation.

Socialized – Self-Authoring Transition. In the transition to a Self-authoring mindset a tension started to exist between someone's affiliation and his or her new capacity to see themselves and their ideas as distinct from their affiliation. Where they were in that transition determined how they defined their responsibility to that affiliation. Participants who exhibited both the Socialized and Self-authoring mindsets felt comfortable separating SeaPlan and the legislation but were concerned with balancing the needs of the State government and the needs of other interests.

"We need to balance both science and management with the legislation. It's critical that we integrate all."

This demonstrated a new capacity to consider two possibly opposing perspectives. In general, Socialized/Self-authoring participants might have mentioned affiliation but also mentioned more personal reasons for getting involved with SeaPlan such as, "I am someone who is interested in policy work. I am someone who is interested in trying to get a better idea of how you would actually do EBM." Or "I am sort of fascinated by the intersection of science and policy and seeing how that comes together and how scientific information actually gets used or not in making decisions. It is a personal interest." There also started to be a tension between competing priorities and personal and professional boundaries started to emerge. They no longer allowed someone in authority to be the sole determiner of their time or values; They began to realize some of their own internal authority. Yet, they also had a profound and fundamental sense of loyalty and obligation to their affiliations.

Self-Authoring Mindset

> I've spent a lot of time in the public policy arena and in the Atlantic and Pacific watching the evolution of oceans…I've watched the decline of marine life and coastal oceans and that's exactly what SeaPlan addresses. SeaPlan is trying to build a community of interests

> that recognizes that there are a variety of competing interests for the use of the oceans and we have to work out common grounds as to how the interests can work together rather than all individualistically trying to pursue selfish interests. I look at it as a commons situation.

Note the use of the word *community* in the excerpt above. The idea of community was a strong thread throughout the Self-authoring interviews. Community meant a group of diverse individuals coming together to learn. This type of learning community became an affiliation of sorts where difference rather than similarity was valued, expected, and was the underlying principle for coalescing. They didn't "belong" to a particular affiliation rather they created their own affiliation; they were creating it via the SeaPlan process. Consider an exchange at a SeaPlan meeting between Socialized and Self-authoring participants. The Socialized participant was concerned with fitting in and ensuring that the interest of her affiliation was not forgotten. The Self-authoring participant responded indirectly with her belief that there was concern for small businesses and that she hoped a budding partnership would begin.

> Socialized participant: I hope that this is a balanced initiative that supports all stakeholders and values small businesses along the waterfront. I want to make sure that there is access for everyone and everyone can continue to make a living.
>
> Self-Authoring response: I believe in what local communities are all about. I want to forge local community and government partnerships. I hope we can set the benchmarks for success and that all other groups start following us.

Both individuals used the word hope. The individual with the socialized mindset was reacting to an initiative she saw as "out there," and defined by/created by someone else. She did not yet have a sense that she could manipulate and own the process. The Self-authoring person stated her belief as a personal conviction, as someone who felt a sense of ownership of the process; she was responsible for contributing to its creation.

Differences in how someone related to the idea of affiliation were powerful motivators or disincentives for collective change. The strength of those exhibiting Socialized mindsets was that they got the idea of connection and thrived on it. Their limitations existed in being able to separate from and differentiate among the various connections and embrace their differences as a means to self-growth. It was difficult for them to step back from their own affiliation and embrace a different, and perhaps competing, affiliation. If they were to make a connection, they wanted it to be harmonious and agreeing. Disagreement and conflict tended to be very difficult for them, which led them to try to avoid it.

The strength (from an EBM perspective) of those exhibiting a Self-authoring mindset is that they were interested in learning in connection with others who were different. They were interested in actively seeking out and constructing new knowledge and understanding through dialogue with others. These individuals were interested in developing a new kind of affiliation, a community of discourse. Within this community, they were comfortable with making room for things to evolve which, in turn, helped to create a whole new process and understanding for everyone. Their limitations were reflected in their identification with their own set of values and beliefs in how things "should be." They were too invested in their own perspective and unwilling to change their minds, which often caused the process to stall and ironically, negated their strengths.

There were no significant findings from the Transforming mindset within this sub-theme.

Self-Authoring

The following are excerpts from participants with different mindsets discussing their perspectives about their role in SeaPlan or the role of SeaPlan generally. What's unique was the way in which participants saw the process as either prescribed or open to interpretation. Those with a Socialized mindset saw the process as created "out there" by someone else. Those of a Self-authoring mindset saw it as an open-ended process awaiting the group's actions.

Socialized Mindset. SeaPlan's Socialized meaning makers tended to create their sense of reality through another's frame of reference such as a leader they respected. There was a need to hold others' perspectives to a test, which resulted from seeing themselves and their roles in the process as loyalists of and protectors of their own affiliation and interests. Their loyalty to and identification with their particular affiliation was the guide to their participation in SeaPlan. They entered into the SeaPlan process as one that was prescribed for them and they wanted to ensure their interests fit the prescription. They played more of a reactive role – one in which they reacted to others and the process rather than actively creating it. This way of making sense of the SeaPlan process caused one to act with trepidation. This participant is responding to a question about endorsing the SEAPLAN process and strategic plan.

> So we're behind it, we just don't wanna have the XX make a knee-jerk plan that ends up causing all kinds of havoc for small businesses that already have to go through just dozens and dozens of layers of permitting and regulation to do the smallest thing on the water front. I fear that the die may already be cast and words like EBM suggest that we just want marine protected areas everywhere. I want to make sure that there is access for everyone and everyone can continue to make a living.
>
> For others a prescribed process lessons one's responsibility.
>
> I am very comfortable in the (SeaPlan) dialogue. I haven't been put on the spot but again it is state waters and I have the luxury of being a (AFFILIATION). How separate is the SEAPLAN process from the legislative piece, I can imagine that makes others much more uncomfortable than me because it is not really my business. I can't lobby for that, I can't work toward it. As a (AFFILIATION), I would be reacting to that legislation passing.

Self-Authoring Mindset. As the Socialized meaning maker's capacity grew, a kind of personal theory or sense of reflection on SeaPlan began to take shape. The content was described as well as their conception of it. This Self-authoring participant talked about something as his perspective.

> So in my view if this is a successful effort, it will actually begin to push the envelope on what gets done from a management perspective. There will be more integration, more

> analysis of cumulative impacts. But that will only be partly success. If it did just that, it would fail in my mind if it didn't also try to advance the science behind this and try to understand how you would not just practically do it but try to think about it and use it as a way to inform other processes.

This participant identified multiple aspects of success and comes with multiple, diverse ways to put it to use – implement and apply it - regardless of his own affiliation's interests. Individuals exhibiting Socialized mindsets had a deep interest in their own sector's issues and concerns but had difficulty critiquing those concerns or stepping outside them to embrace competing concerns. They experienced doing that as being disloyal to their own affiliation.

The strengths of Self-authoring meaning makers could also be considered limitations depending on the context of the situation and the mix of individuals involved. Self-authoring individuals brought their own perspectives to the SeaPlan process and continued to develop their own perspective in response to new information and understanding. They recognized that others had their own interpretations and biases and they advocated for these other views in pursuit of the mission of SeaPlan. Socialized meaning makers reacted to the many perspectives put forth which allowed them to maintain loyalty to affiliation. In conversation, those differences in mindsets often played out as passive and active discussion participants, e.g. those with a Socialized mindset spoke up to ask questions, give examples, or clarify something about their affiliation's interest while those with Self-authoring mindsets, offered new theories for the group to explore. Those new theories were not always fully understood by all the participants. This significant point was often missed by Self-authoring participants who implicitly assumed that they were understood, which resulted in confusion and sometimes, defensiveness.

Self-Authoring with Transformative Mindset: Lastly, there were four participants who exhibited the Self-authoring mindset yet also exhibited the transition towards the Transformative mindset. In some instances, this made a difference in terms of the capacity with which they reasoned about a situation or idea. For example, in the case of actively generating theory, there was a strong sense of personal responsibility, theory and reflection on that theory yet there was a hint of something more. There was uncertainty weaved into their theory about SeaPlan's purpose, yet, with a clear understanding that ambiguity would be part of the experience.

> We don't really know what MOP is yet and that's been a repeated discussion at every meeting. People are there to some extent out of curiosity. If it's going to happen, you want to be there when it happens and want to be able to influence it and make sure it comes up with what you want it to be. I think that's what keeps people coming but I also think it keeps people away and on their guard. We don't really know how open people have been because we haven't gotten to anything tough. It would be great to see all of the thought bubbles behind all the nice words. We haven't been challenged yet. It's been hard in that it's been grueling and there's been a lot of uncertainty but …

Capacity for Self Reflection

The following are excerpts of participants with different meaning making complexities discussing their own perspectives on the SEAPLAN process.

Socialized Mindset. Participants with a predominant Socialized mindset primarily reflected on how others perceived their input or their role. When asked about their voice in the process, they referred back to the collective voice of their affiliation, e.g. agency, sector. Whether through an affiliation or the SeaPlan process itself, they tended to be keenly aware of what they believed to be the effects of their participation through the eyes of others. They judged the process by how they thought others responded to them and their affiliation's interests.

They internalized the many perspectives of others in the group. Consequently, they were very aware and focused on how their thoughts and opinions were the same as or different from others. Self-reflection was described in relation to sameness or difference. Differences were generalized to "other(s)" when reflecting on the motivation of participants.

> Everyone's obviously interested in their own thing (in SeaPlan). It's diverse. There are social scientists. Me and the social scientists have of course very little in common with how we see the world.

Over time once perceived differences evolved to feelings of connection for some. This connection was often due to an initial trust of those perceived as authority and eventually transferred to others.

> I didn't walk in that room (SeaPlan meeting) at all initially and feel comfortable. I was surrounded by people who were senior to me and certainly more educated. The room was dominated by scientific types which I'm not. It was initially an intimidating environment. I came to see over time that through the facilitation and leadership, a lot of my fears went away and my comfort level grew. And that's partly their style of soliciting opinions from quiet people and also getting to know the expertise in the room.

Self-Authoring Mindset. Those exhibiting a Self-authoring mindset reflected that it might be necessary to move beyond one's personal comfort zone when the process conflicted with one's personal theory.

> I assumed that since I'm on a science advisory panel, I was there for that reason and that makes sense. But it seems it hasn't been thought out yet what exactly is going on. I have been pushing for some context in these meetings and once I understand the context, it is much easier to say okay this is what we should do. I am a little uncomfortable with that because I am comfortable with myself as a (PROFESSION) and I am not comfortable with myself as a big thinker but in order for me to get to the point where I'm comfortable participating as a (PROFESSION), I need to understand the context.

Some of the participants with Socialized mindsets were able to broaden their perspectives because of supportive challenges from trusted others. One participant described how she felt out of her element at first and was very skeptical of the whole process. Yet, because of the kindness of the facilitator and the inclusion from other members, she started to reflect on her fears and discomfort and open up to new possibilities. This, however, took time – nearly a year of on-going interactions. Individuals of all mindsets created meaning that enabled them to feel safe and familiar. With supportive challenge, individuals could extend themselves to new ways of knowing – not necessarily a full transformation from one mindset to another but a glimpse at what could be. From an outside perspective, the transition from Socialized to Self-authoring seemed quite rewarding as one started to see oneself in completely new ways. It also seemed daunting and difficult for these individuals to make sense of the conflicting sides of the self. The SeaPlan Facilitator played an important role for the Socialized meaning makers. They trusted her and saw her as a neutral authority with their best interest in mind. She was a conduit for them to experience different ideas and uncomfortable exchanges.

There were no significant findings from the Transforming mindset within this sub-theme.

Perception of Other

Throughout both the EBM and the developmental interviews, participants commented on motivation of other SEAPLAN partners, co-workers, state authorities, family, and friends. How participants perceived someone's underlying motivations differed among mindsets.

Socialized Mindset. The strong link to affiliation and authority was a recurring theme when those exhibiting a Socialized mindset discussed their perspectives of others involved with SEAPLAN.

> And so, even though they (SEAPLAN facilitators) asked and said you (participants) are not signing your office up to support this document. This is you personally. I think for most people who work for agencies and XXX, they go into meetings with the mindset of their agency, not just them personally. I think they are there to see what this is. They are not mandated to do this so they are not going to speak up. If they were mandated, they would speak up but because we are getting together and trying to create this, they are there to listen.

Similarly to the Socialized excerpts under the affiliation theme, affiliation came up again as a motivating factor for them – influencing how they acted and reacted. There was not clear differentiation between one's personal feelings and ideas and the ideas perceived to be upheld by the affiliation.

Socialized / Self-Authoring Transition. In the excerpt below, a participant who was just starting to exhibit some Self-authoring started to see that differentiation and still saw others suppressing personal feelings and ideas to uphold the relationship to the affiliation.

> I think the partnership was blessed to have adept facilitators who were able to keep conversations on topic and identify areas of friction, entertain them but not wallow in them. I don't think that resulted in further polarization. I'd like to think that some of these barriers are starting to come down and people were not on the defensive by the end of this and really starting to feel like there was a level of trust that was being built and shared. I do think some parties basically remained entrenched in the party line. Whether that party line was the message they were forced to carry and maybe they believe differently personally or professionally, I don't know. I'd like to think that would be the case and they were doing what they thought they had to do.

With participants who were in transition from Socialized to Self-authoring mindsets, upholding a responsibility to an affiliation was a fine balance between responsibility to other and responsibility to self. A responsibility to the self and its perspective, as well as understanding the "truth" of others from their own perspective, was the balance beam.

> It's like two channels I'm thinking of. One is developing a substantive rapport with the group so there's a mutual respect. They understand what I bring to the table and I value their expertise because of the role they fill. But to me equally as important is establishing a personal, professional connection because I really care about how these people do in their jobs because it affects the overall success of what we're trying to do together so I try to take an interest in understanding their challenges, their road blocks.

Simultaneously, this participant upheld her Socialized need for mutuality among participants but equally as important was her Self-authoring need to understand others' differences and define her own differences. To do this, she must hold both her need for mutuality and her need to form a realistic picture of the others' different perspective. This was a balance for her.

Self-Authoring Mindset. Balancing the needs of self and other was described differently in Self-authoring individuals. When discussing barriers to SEAPLAN's success, they reflected on others as though they, too, were juggling many variables.

> One of SEAPLAN's challenges will be convening groups as they're working toward harder positions or consensus on tangible things – find ways of setting the table so people will feel that they really have to be there – that they're going to miss out on something if they're not there. Because some obviously haven't been attracted enough to come and it's tough because everybody is busy and these are long meetings and a lot of conference calls. It's a lot if you're not bought in. You have to really believe in the concept, the big picture – not just that it'll be a value to you.

There was a concern about paying attention to the underlying needs and interests of others instead of the concrete standpoints of others.

Self-Authoring Mindset with some Transformative Mindset. Similarly, those with some Transformative mindset were intrigued by the many variables that made people tick and were particularly interested in better understanding those as a path toward self-understanding. This next excerpt was from one of the participants who wanted to get a different perspective from his own on the logging happening in the old growth forests of the Olympic Peninsula. To do this, he engaged a logger in conversation. While this excerpt is about a different theme, it was taken from his Subject Object interview and is interesting to note. Unlike those participants straddling the Socialized/Self-authoring balance beam, there was no line to be drawn. He was "available" to have his thinking re-oriented by another. Those parts of himself were integrated. Note also that he was speaking about difference as interesting not threatening.

> (Talking with him) completely re-oriented my thinking about the issue because I'd never had direct contact with anybody in that part of it." Interviewer: What compels you to put yourself in these positions to be reoriented? "People are much more irrational and hard to

> follow and complex but I believe it's possible to model their dynamics and to predict how they will react to a change in state of the rest of the natural system. I view this as essential preparation for doing anything innovative or useful in conversation. I really want to know every nuance of every single person so I can understand how they work. People are interesting. It's rewarding to lean about how people deal with the world. It's better than television. I don't know where to draw the line professionally.

Pertinent differences between Socialized and Self-authoring mindsets included the extent to which they reflected on why another person did what he/she did, the extent to which they recognized another's underlying reasons for acting in such a way, and the extent to which they recognized and readjusted their own interpretations, needs, motives, and reaction patterns to another.

For Self-authoring mindsets and beyond, there was an increasing ability to step outside oneself or one's perceptions and separate from one's own view to observe and reflect on all the subtleties of what was happening. When this happened, the conclusion one formed about another wasn't entirely framed by one's own feelings and interests (Jordan & Lundin, 2006).

The participant in the last excerpt considered his counterpart's reasons for his/her attitude to imagine and understand someone else's reality. He was aware that his reality was separate from another's and that they were both whole pictures of reality. This participant's Transformative mind peeked through as he reflected upon his own motivation. What's interesting about this next excerpt is that as he reflected on his own motivation, he not only noticed his own internal contradiction that he believed people mean well but could also have a dark side but he actively and explicitly makes a decision about how he was going to think. As he began to see and accept the many sides within him and his contradictions, he began to see and accept others and their contradictions (Sinnott, 2006).

> I've decided to believe that most people mean well. I have many, many experiences to the contrary. It's interesting to know what motivates people in my profession to do this kind of stuff. And I'm wondering how many others have had to face that same decision to deliberately exercise faith in humanity and in people…I think it's a prerequisite for accomplishing anything like bringing communities together to discuss how they're going to relate to the world, setting up systems for stewardship. It just requires a general trust that people share certain values. They value their children's lives. They value the future. They value that life remain glorious in its diversity and complexity. You have to otherwise, it's pointless but that said, that ambition leads people like myself toward humungous projects that can really only be approached with immense ah cynicism. And in those projects, which I'm still not sure why I get involved in, I have been double-crossed, been hurt very badly, become very ill - had horrible experiences. It's always because of a real minority of people, like one or two in a region the size of east Africa or North America. Those individuals are so bad that they restore my faith in one other thing – evil. They're really genuinely are evil people and it only takes a couple to make these challenges that we're involved in seem sometimes insurmountable.

Particularly important to note about the last two excerpts is the empathic voice that comes through in his words. Each of us engages with other people all the time, people who are different from us. Throughout most of these engagements, perspective-taking capacities stay intact. However, there are some interactions that are so powerful that they become transformative, i.e. a new way of making meaning is constructed. He explicitly faces and acknowledges contradictions in his own way of knowing. It was only within the interviews with participants who exhibited some Transformative structure where these internal contradictions were mentioned.

> Interviewer: What are the barriers within SEAPLAN to creating a new paradigm?
>
> Participant: Well, I think preconception is certainly one. I have plenty of preconceptions it is not that I'm out of that loop but certainly, preconception and its handmaiden -fitting within existing structures -they kind of reinforce one another, and there are the absolute realities that we have governmental structures and funding structures, both of which are the foundations of any action that can be taken and those structures change slowly so it is not surprising that those concepts keep coming up. It is why I say maybe there is not another way and I think that's why those people that guide us with their own concepts and don't put down any good ideas that don't fit with their views are very facile. Maybe there is no other way than to use the old concept sort of rethreaded. I think that if anyone, particularly some of the organizers, heard me say that, they would say -geez, let's throw him off. But, I am an enthusiastic supporter, I just worry that things are declining faster than any of these processes can really make any difference, maybe that is just a fact of life on this earth.

Ongoing dialogue and exchange of different ideas, within an emotionally safe meeting space, was important for those with Socialized mindsets in order to buy-into cooperating with diverse interests and to start separating oneself from other. Dialogue for nearly all participants was a sort of education about oneself and one another. For Socialized individuals whose conceptions of other were more closely tied to oneself, open dialogue helped them to reflect on how their initial perception of someone might have been reconceived. They became less defensive. Differences didn't seem as threatening to one's sense of self as one began to separate oneself from other.

Summary

One cannot pick and choose who manages the marine environment. EBM is about cross-sector interactions and progress is achieved by communication among and between decision-makers of different mindsets. More insight is needed into how different mindsets interact with one another and how those interactions affect policy formation processes.

Perspective-taking on self and others takes on many forms. What does this all mean for environmental decision-making? At the very least, understanding "where someone is at" with their capacity to have and take on new perspectives is helpful for setting expectations for which EBM tenets are achievable given existing learning mechanisms. SEAPLAN facilitators can build a learning community by setting up processes that speak to participants where they are and acknowledge differences in meaning making. In addition, there is a tremendous opportunity with processes like SEAPLAN that are focused on cross-sectoral decision-making to become venues for developmental growth. Time, continuity, support, and practice are essential elements for developmental growth. SEAPLAN's structure currently supports these elements. There is time, outside of government, for participants to hash out individual differences. There is continuity among members and they are continuously courted to remain involved. The meetings provide a supportive environment to "leave your affiliation at the door" and speak openly. The nature of SEAPLAN is to provide capacity for these diverse individuals to practice trying out new perspectives, get clearer about their own, and/or understand others'. SEAPLAN can become a model for other EBM-like processes by being even more intentional about these elements. Kegan calls this type of environment a "holding environment" in which an individual's environment has three functions: 1. To support them where they are developmentally, i.e. how they interpret and reason about the situation (Kegan et al., 2001; Popp & Portman, 2001). 2. To challenge the individual to stretch the limits of one's current meaning making system. 3. To provide a stable space an individual needs to integrate new ideas and feelings into his/her current meaning making system that will transform his/her way of knowing. This transformational learning can, in turn, benefit the stakeholder engagement process itself. The process becomes a classroom for learning rather than a courtroom for debating, winning and losing.

Conclusion

The following are research considerations for SeaPlan and other stakeholder engagement processes whose main purpose is to manage marine resources more holistically. Our overarching question was: Do the implicit expectations and mental demands of EBM practices require a complexity of logic and reasoning that outweighs participants' capacities?

Considerations for EBM Stakeholder Engagement Processes

1. The complexity of an EBM decision-making mandate requires attention to the complexity of the adult mind. Developmental psychology has a role to play in creating more optimal stakeholder engagement processes that are more relevant and therefore, meaningful for the individual stakeholders.
2. Decision-makers must be acutely aware of the act of decision-making, i.e. the process itself must be intentional. Optimal stakeholder engagement must be part of the decision-making process from the onset and not relegated to a supporting role.
3. Research partnerships should be developed between developmental psychologists and social scientists studying public participation and engagement.

Consideration 1: The complexity of an EBM decision-making mandate requires attention to the complexity of the adult mind: Developmental psychology has a role to play in creating more optimal stakeholder engagement processes. It is not necessary nor is it feasible for managers or professional process facilitators to be experts in developmental psychology in order to consider the mindsets of decision-makers. It is necessary, however, for them to learn how to facilitate processes that effectively invite all of the mindsets into the room. There are ways in which one can recognize developmental traits and adapt and/or create a process that works with and for a range of developmental capacities. If the complexities of meanings which individuals bring to the process of engagement continue to be ignored, processes will be created and policies enacted that are not truly and comprehensively EBM. To accomplish EBM's primary tenet of managing across sectors, the stakeholders across all sectors must be engaged. They cannot be optimally engaged without attention to how they make sense of the process and its intended goals. And if they are not engaged in ways that meet them where they are, the process will fall short of fully integrating all stakeholders into decision-making. From a developmental standpoint, a stakeholder engagement process must be created with the people in mind. It needs to speak to them, where they're at developmentally. The process does not and cannot stand alone separate from its participants. The process itself cannot have a direction or a goal separate from what its participants understand it to be.

How someone makes sense of the process translates into what and, more importantly, how they learn. A person with a Socialized mindset may come to the process to gain knowledge about EBM because they feel responsible for their affiliation's interest. As one participant said, "This is going to happen. It's just a matter of how and when and I want to make sure I understand how it affects my affiliation." These participants come to a learning process asking "What am I supposed to know?" A person with a Self-authoring mindset may come to a learning process thinking about what they want to learn and accomplish. Stakeholder engagement processes, when looked at developmentally, are ripe classrooms not only for developmental growth but for creating processes or reworking existing ones to more fully connect with participants' capacities.

Consideration 2: Decision-makers must be acutely aware of the act of decision-making, i.e. the process itself must be intentional. Stakeholder engagement must be part of the decision-making process from the onset and not relegated to a supporting role. It must support deliberative characteristics. Throughout the research process, it became apparent how important stakeholder engagement was in order to obtain EBM objectives, particularly those related to making trade-offs more explicit. Decision-making must move away from an interest-based discourse to a deliberative discourse that takes into consideration the inherent interaction and interdependence between the individuals involved and the context in which they find themselves. EBM literature on stakeholder processes offers considerations aimed only at upholding an ideal rather than simultaneously considering who the stakeholders actually are. By intentionally considering developmental capacities when creating a stakeholder engagement process and by using deliberative characteristics, EBM processes can become mechanisms for a new kind of learning which in turn enhances the EBM process.

Stakeholders must be optimally engaged from the onset through an official mechanism that is connected to, but not directly from, government (such as a public/private partnership). The engagement process should start long before the mandating process starts, if possible, and become a permanent mechanism for ongoing dialogue across sectors. EBM stakeholder engagement processes should not be predetermined. There must be intentionality about the process development and ongoing recognition of process traits as the process unfolds. And most importantly, participants should be aware or made aware of these process traits. With awareness, there is a better chance that some participants can help enable the process to adapt.

Consideration 3: EBM stakeholder engagement processes, as described above, are inherently excellent learning organizations. Many stakeholder engagement processes are not necessarily created with actual participants in mind. They are not created to meet the needs of a range of participants. They promote informational versus transformational learning. They encourage dialogue and deliberation but fail to understand and/or acknowledge when participants can't achieve these ideals. Cross-disciplinary collaborative research can teach us how to address the cognitive, emotional, social, and political variables that EBM stakeholder engagement processes inherently demand. And in doing so, create and sustain processes that do, in fact, consider and include the whole of the ecosystem.

Correcting Improper Uses of Perspectives, Pronouns, and Dualities in Wilberian Integral Theory: An Application of Holarchical Field Theory

Kevin J. Bowman[1]

Abstract: This article uses my pre-existing extension of Wilberian metatheory, holarchical field theory, to diagnose and work towards overcoming the confusion within attempts to analyze action, events, and communication using Ken Wilber's AQAL model. In holarchical field theory, *holarchical fields* become the fundamental component of reality. These fields comprise 1) holons in relation to one another and to their potential, and 2) their interpenetrating forces engaged by their interactions. In light of the theory, problems in the Wilberian literature have included inconsistent uses of certain dualities (subject-object, interior-exterior, and inside-outside) as well as person perspectives and pronouns. Previous attempts to overcome these issues without precise diagnoses suffer from a conflation of the dual definitions of the subjective-objective duality, one a philosophical definition, the other grammatical. State versus action language is classified within the dualities of holarchical field theory.

Keywords: AQAL, holarchical field theory, integral communication, integral scientific pluralism, Ken Wilber.

Introduction

In my recent work (Bowman, 2009, 2012a, 2012b), I have extended certain key aspects of Ken Wilber's AQAL model to form what I call holarchical field theory (HFT). It encourages a more formal and consistent analysis of action and events between subjects and objects using Wilberian integral metatheory. HFT has the desirable feature of being able to incorporate a field-theoretic framework for a more dynamic use of Wilberian theory. HFT will be situated in some of the literature of field theories in the social sciences that have been used to analyze individual, organizational, and society change, particularly the strands that closely follow the field theory of Kurt Lewin. The objective of this article is to improve upon the internal consistency of Wilberian thought, thereby readying it for more appropriate use in analyzing multiple-holon interaction.

Problems associated with Wilber's integral mathematics will be demonstrated and corrected using holarchical field theory.

Of particular concern here are the inconsistent uses of the subject-object, interior-exterior, and inside-outside dualities as well as person perspectives and pronouns in the Wilberian literature. Wilber (2002, 2006), Edwards (2003) and O'Connor (2008, 2010) all propose alternative uses of pronouns and person perspectives using Wilberian metatheory. Edwards' and O'Connor's critiques of Wilber's uses of pronouns and person perspectives show that these features of Wilber's approach need reconsideration. In light of HFT, however, Edwards' and O'Connor's alternative uses will be shown to suffer from a conflation of the dual definitions of the subjective-objective duality, one a philosophical definition, the other grammatical. This reductionism will be coined as the philosophical/grammatical conflation. This will demonstrate an advantage of having a clear differentiation of these dual meanings within the extended Wilberan framework of HFT.

Holarchical field theory (HFT) reconstituted integral theory such that *holarchical fields* became the fundamental component of reality. These fields integrate the two previous fundamental units of Wilberian theory: holons (Wilber 1995) and perspectives (Wilber 2002, 2006). Holons (as defined by Wilber, 1995 who followed Koestler, 1964) are (organisms, collectives, things or systems that are) simultaneously a whole in one context and a part in another. Holarchical fields include both holons in relation to one another and to their potential, as well as their interpenetrating forces engaged by their interaction. A component of HFT is integral scientific pluralism (ISP), which integrates Esbjorn-Hargens' (2010) integral ontological pluralism and integral epistemological pluralism into zones created by a fuller use of the dualities in Wilberian theory (Bowman, 2012a). HFT is a dynamic extension of integral scientific pluralism (Bowman, 2012b).

ISP and its extension into HFT are summarized in the next section of this article. I then situate HFT as a metatheory bridging Wilber's AQAL model and field theories in the social sciences. HFT is then used to spot and avoid some confusion within attempts to analyze action, events, and communication using Wilber's AQAL model. The subsequent section presents the alternative uses of perspectives and pronouns by Edwards (2003) and O'Connor (2008, 2010) as suffering from the philosophical/grammatical conflation. I then demonstrate how state versus action language can be classified within HFT. This section also shows that pronouns and first-, second-, and third-person perspectives cannot be reduced to particular AQAL or HFT realms without qualifications. This finding plus the specification of the philosophical/grammatical conflation helps one better understand the subtle meanings and inconsistent uses of dualities by Wilber in the next section. The subject-object integration in HFT is then used to weigh in on the recent dialogue between Ken Wilber and Roy Bhaskar, founder of critical realism, related to an epistemic fallacy in integral theory and an opposing ontic fallacy in critical realism. I then conclude. The appendix provides a new instructional example of two individuals communicating (a dynamic event) to illustrate the elements of HFT.

Summary of Integral Scientific Pluralism and Holarchical Field Theory

This section briefly summarizes first, integral scientific pluralism and then, its extension into holarchical field theory.[2]

Integral Scientific Pluralism and Modularity

Compared to Wilber's AQAL, integral scientific pluralism more formally includes the dualities of internal-external and health-pathology as well as the subject-action-object triad. I will clarify Wilber's use of the eight zones, which makes use of the internal-external duality. I will then divide each zone by the health-pathology duality and the subject-action-object triad. The division of each of the eight zones by the subject-action-object triad is justified by Wilber's notions of broad and good science. Broad science includes interior and exterior types (Wilber, 2000b). Good knowledge requires knowing the kosmic address of the perceiver (subject), perceived (object), and "what injunctions [methods as actions]…a perceiving subject must perform in order to be at a Kosmic address that can perceive the object" (2006, p. 267). Only the methods (actions of scientific inquiry) are formally included in Wilber's integral methodological pluralism. The proposed complements of integral ontological and epistemological pluralisms (the object and subject realms of scientific inquiry, respectively) will be formally included within integral scientific pluralism.

One benefit of adding the health-pathology duality is to aid in the examination of those things that contribute to or inhibit development. Edwards (2010) methodically and metatheoretically examined the metatheories of Ken Wilber (AQAL) and Bill Torbert (developmental action inquiry) (Torbert, 1976, 1991, 1999; Torbert et al., 2004) along with a thorough meta-study of the organizational transformation literature. Edwards specified the health-pathology, internal-external, and perspectives lenses as lenses that appear in the literature studied. They are also lenses that are used, but not formally, in AQAL (Edwards, 2010, p. 217). This provides additional justification to formally include them if logically supported and consistent.

The construction of integral scientific pluralism (ISP) begins with Ken Wilber's eight zones of integral methodological pluralism (IMP). For Wilber (2006), IMP uses the eight zones as eight different perspectives to view the four quadrants (pp. 36-40). For example, the individual-interiority of the upper left quadrant can be examined internally (as with the class of methodologies called phenomenology) or externally (with the structuralism class). In a later section, I will show that Wilber has not always consistently followed his own definitions of the internal-external or inside-outside dualities. Wilber (2002, Excerpt C) defines *internal* constituent parts of holons as following the agency of the holon while those that do not are *external*. Parts that are *inside* a holon are within its boundary. Items beyond its boundary are *outside* of the holon. Parasites or repressed thoughts are examples of items that are inside holons, but not internal to the holon.

---

[2] Here I will provide brief justification for the extensions. Citations will be provided for my earlier work and its more detailed arguments.

For HFT, I define the internal-external duality as Wilber defines the inside-outside duality (items separated by the holon's boundary). Thus, I can use internal-external the way Wilber uses inside-outside in the formation of the eight zones because I will also allow for positive (healthy) and negative (pathological) aspects which are internal or external. So a parasite or a repressed thought is a pathological internal item.

I use the term internal-external (instead of inside-outside) for the following two reasons. One is that internal and external aspects can be associated with the common dynamic terms of internalize and externalize as was done in Bowman (2009). We do not have verbs like insidize or outsidify. The second reason is that all the distinctions that Wilber makes can be fully accommodated when the health-pathology is crossed with what I am calling the internal-external duality.

I define healthy items as those that are capable of contributing to meaningful needs satisfaction (which would include items that aid in meaningful development). Pathological items are items that tend to be destructive and may inhibit meaningful needs fulfillment and development. This is consistent with Wilber's (1995, p. 78-79) discussion of healthy and pathological drives such as autonomy (healthy agency) versus dissociation (pathological agency).

To distinguish between healthy and pathological actions that emanate from healthy and pathological holonic aspects, respectively, I use the adjectives positive or negative. Thus positive externalization is a force that contributes to healthy expression, needs satisfaction, or development that moves beyond the border or a holon (as when the education of the mother benefits her child). Please note that internal-external is different from the interior-exterior duality. My thoughts and our mutual understanding are interior aspects while my brain processes and the interstate highway system our exterior items. My thoughts and my brain processes are both internal to me as an individual holon.[3]

I treat the eight zones as not only eight perspectives, but also eight distinct realms in which holons exist. Thus the phenomenologist examines individual-interior objects as they appear in the internal realm of the phenomenologist. The structuralist may ask questions of individuals to study their individual-interior as they appear in the test-subjects' external realm. This will aid in tracking the aspects of the subject that perceives versus the aspects of the object being perceived. Examining four-quadrant evolution or deciphering the relatively healthy choice in a given situation benefits by differentiating relevant internal and external items. For a generalized example within Wilber's stated four-quadrant correlations, two largely egocentric tribes cannot sustainably merge within a sociocentric empire and transform their culture up to that correlative level without a certain aspects that are internalized, like emergent capabilities (taking the role of other, sociocentric rules, etc.) while others are externalized (irreconcilable myths and procedures that oppose those of other tribes they may unite with).

---

[3] The labels healthy and pathological internal and external are also more intuitive that relying on the definitions Wilber specifies for inside-outside and internal-external. The two dualities are easily confused without keeping careful track of the definitions.

Treating the eight zones in this manner then allows for them to be crossed by the subject-action-object triad such that each zone can be seen as an area from which a subject takes a perspective (subject) and interacts (action) with its environment (object). This is necessary to specify the scientist (subject in this example), his or her employment of methods (action) and the object of study (object). This creates 24 horizontal zones of each level of development. Crossing the realms further with the health-pathology duality makes the 48 horizontal realms of *integral scientific pluralism* as shown in Figure 1. This article will contribute to a view that a formal extension of AQAL to include the internal-external and health-pathology lenses is beneficial.

With ISP, the eight classes of methodologies (IMP), when employed, can be seen as dynamic interactions between the subject scientist and, potentially, an eight-zonal object. This encourages a high degree of reflexivity of the subject scientist, which is an important focus of the metatheory of Edgar Morin (2001, 2004, 2006, 2007; Montuori, 2013). Given the fractal nature of ISP, all 24 horizontal realms, once mastered, become a new tool (a new method). An object of scientific inquiry can be examined as at the center of its own subject interacting with other objects. Taking a perspective then becomes a particular action from the subject realm to the object realm that can be mapped with this approach. Later sections will show that a more formal treatment of perspectives is needed in AQAL

Esbjorn-Hargens (2010) began to postulate an integral ontological pluralism (IOP) and integral epistemological pluralism (IEP) to complement Wilber's IMP (within a Wilberian approach). Similarly, Esbjorn-Hargens and Zimmerman (2009) organize their Wilberian metatheoretical study of ecology by the Who (subject or IEP), the How (action/method or IMP) and the What (object or IEP). Therefore, IEP, IMP, and IOP reside neatly within the ISP realms.

Consider how ISP informs its user of how scientific inquiry involves these ISP realms. For example, the scientist interprets data using his own interior-individual-internal symbols, translations, etc., and is constrained or empowered by his own psychograph (phenomenology). Ideally, he judges the correspondence of his thoughts to his written output and makes assumptions of the interior-individual receptivity of his readers or the interior-individual motivations of his test-subjects (structuralist). Whether or not he is scientific or not as a structuralist, he must work with his own thoughts. He views his objects of study through cultural understanding such as the accepted paradigm of his discipline (hermeneuticist). He must present novel findings that can have an impact in that paradigm (cultural anthropologist). His scientific endeavor is fostered in part by his individual biological skills such as his dexterity at manipulating scientific instruments and computer keyboards (autopoietic scientist). The social structures in which he is an internal member such as the persuasiveness of his academic appointment and his ability to obtain research funding also influence him. Those social aspects that are currently external to him, such as the carrot of tenure, other non-academic options, or a wider academic readership also drive and constrain him, consciously or unconsciously (social autopoietic scientist).

I distinguish between primary and secondary methodologies. Scientists tend to work within a certain strand or a few strands of established scientific inquiry. They present their findings from the accepted methodologies within these strands. These are the stated methodologies or *primary methods* within the paradigm. The other methodologies are *secondary*. They are methods used without scientific justification when evaluated according to the best scientific principles available across the broad sciences. They are used less consciously, less transparently, or less justifiably as when the dominant paradigms in economics and political science assume all agents to be atomistic and egoistic. The atomistic and egoist assumptions are not justified (without proper contextualization) from an ISP lens because it violates the roughly known distribution of agents found by structuralist and cultural anthropological sciences. Yet the assumption is accepted by precedence within positivist and empiricist schools of thought. So scientists do not merely take an exterior perspective (or what Wilber and Esbjorn-Hargens call a third-person perspective). All eight perspectives are taken together while the exterior perspective may be the stated (primary) method. Understanding of the distortions from secondary methods, I argue, is an important ongoing project for Integral Theory and a key to the success of Wilber's integral reconstruction. His model does not heap together knowledge from across various disciplines, nor does it construct a scientific study controlling for all eight methodologies. Rather, it includes partial truths and removes partially invalid assumptions and results when they are examined in context with the other disciplines and wisdom traditions. This is a particular, skilled, and broad use of these eight methodological classes. This Wilberian, metatheoretical methodology I call *integral scientific modularity* (ISM) (Bowman, 2012a). With the aid of the formal constructs of AQAL (such as the many levels of the four quadrants), findings from one discipline are contextualized and integrated with findings from other disciplines.

ISM adds insight into Wilber's epistemology and methodology. It is consistent with, and bolsters Edwards' (2010) contention that "orienting generalization cannot be validated at the middle-range level because they are only fully articulated at the level of metatheory" (p. 89). Although I would prefer to state '*more* fully articulated', Edwards' statement was in disagreement with Crittenden's (1997) assertion that Wilber's methodology began with orienting generalizations from various disciplines. ISM warns of the potential biases and distorted findings from fragmented modern and postmodern science, yet also provides some direction for an integral reconstruction.

Crossing the ISP realms with the health-pathology duality allows one to clearly see that there are degrees of health within each zone across the subject-action-object triad. In other words, there are healthy and unhealthy aspects within the capabilities and limitations of scientists (epistemologically), within the way they conduct their investigations (methodologically), and within their objects of study (ontologically). Scientific endeavors have revealed aspects of all forty-eight zones. For examples differentiated by epistemology, methodology, and ontology, see Bowman (2012a).

More generally, we can think of a subject and an object as each having healthy and pathological capabilities allowing for positive and negative interaction. Examples of healthy capabilities in particular subjects include well-adjusted individuals psychologically (upper-left), constructive moral codes (lower-left), well functioning body-brains (upper-right) and useful aspects of governance procedures (lower-right). We may be specifying them as internal to individual or collective subjects or in external holons relative to others. Unhealthy, items include individual neuroses (upper-left), physical ailments (upper-right), racist beliefs learned in the family (lower-left), and incentives in the political system that encourage corruption (lower-right) either in a particular subject or object (internal) or in subjects or objects that are related to other subjects or objects (external).

Many unproductive dialogues occur when agents implicitly disallow both healthy and unhealthy aspects to occur in a particular realm. Consider first an exterior-intensive object, the economic system. A Marxist economist and a neoclassical economist may not learn from each other if the Marxist only acknowledges unhealthy aspects of the capitalistic system and the neoclassical economist finds everything about capitalism to be natural and beneficial. For an interior-intensive example, a man and wife in a strained relationship may have trouble reconciling if they each think of the other person as approaching their relationship troubles completely unhealthily psychologically while take no responsibility for their own individual-interior shortcomings as they apply to their difficulties.

When subjects and objects interact, healthy capabilities will tend to cause events that satisfy needs meaningfully while the unhealthy ones will inhibit meaningful needs satisfaction. To chart the various channels of interaction, it is helpful to cross the 16 object zones and 16 subject zones with the static-dynamic duality. This is explained in the next subsection.

Holarchical Fields and Holarchical Development

In order to summarize the holarchical field construct, it will be useful to first discuss Wilber's concept of kosmic address, which, in simplified form, is a holon's altitude (level of development in various lines) plus perspective.[4] Altitude is a static capability or present potentiality while taking a perspective is a dynamic event. ISP makes clear distinctions between static capabilities and potentials of holons separate from their dynamic interactions. Potential implies various possibilities given one's capabilities in a given environment. The possibility may be routine or emergent. For an emergent action for an individual, consider Vygotsky's (1978) zone of proximal development. There is a leading edge for an individual that allows her to solve certain problems. The skills and capabilities in relative lines of development are stocks of development. Solving a problem is a dynamic task. Some, more complex problems are not quite, but closely within the individuals grasp, or within the zone of proximal development, if the individual is supported with someone with a greater, relevant skills set. The dynamic interaction between student and teacher can then build greater stocks of relevant skills for the student.

Since taking a perspective is a dynamic event, I have defined holarchical embeddedness as, essentially, kosmic address without the chosen perspective of a given moment. In ISP, the *holarchical embeddedness* of the subject and all relevant objects is their pre-existing statics (including needs, characteristics, capabilities, potentialities, occupation, incentives, social power differentials, and so on) and history with components of the environment. *Holarchical interaction* of subject and object includes their interrelated dynamic events (perceptions, analyses, active relations, choices, movement, communication, and so on). Empirical investigations would begin with a smaller subset of these distinctions, but theoretically, HFT begins broadly (as is the stated approach in field theory). And theoretically, a clear static-dynamic distinction is needed for a number of reasons. For one, the model can be used to help assess the relative health of stakeholder interactions relative to their potential so that prescriptions can be made to intervene and encourage healthier results. An integral national income accounting would also need the static-dynamic differentiation to specify stocks of assets (such as the levels of four-quadrant capital in the economy) and the holarchical needs satisfied from the production and consumption of goods and services from those assets in a given time period. Holarchically embedding the assets could significantly improve our understanding of economies, networked and otherwise.

The relationship between holarchical embeddedness and the dynamic events between subject and object are explored further with the extension of integral scientific pluralism. ISP can be linked with the dynamic drives of the *holarchical development* model (Bowman, 2009). In holarchical development, the eight zones (interior-exterior times individual-collective times internal-external) times the health-pathology duality are further crossed with the static-dynamic duality. Table 1 represents the relationship between the static realms in which holons exist, and their correlated dynamic action. For example, a holon exists in the four quadrants; that is, it has at any given point in time, intentional, behavior, cultural, and social capabilities and potentials. These aspects are relatively static in nature. The intentional items are described as existing in the individual-interior realm. On the other hand, the dynamic action of reading a profound book can build individual-interior capital for that agent. This would be a combination of positive interiorization and positive individuation.

---

[4] A more elaborate address will include the holon's typology, present state, etc.

Again, positive actions are defined as those that contribute to meaningful expression, needs satisfaction, or development. Negative drives detract from or inhibit meaningful expression, needs satisfaction, or development. Neutral drives neither promote nor inhibit meaningful expression, needs satisfaction, or development. In Kurt Lewin's (1951) field theory, drives are categorized as driving or restraining. Driving forces tend to propel individuals or groups towards a goal or certain action, while restraining forces tend to prevent certain behaviors.

Table 1**.** Holarchical Drives (Corresponding to the Static Dualities) and Examples of Their Corresponding Actions.

Drives of the Interior- Exterior Duality (Times Health-Pathology)	
Positive Interiorization Training or reading a book that expands one's understanding. In a Subject Scientist: An insight that solves a puzzle in the economics literature. In/As the Object of Study: The productivity improvements from a transformation of consciousness of the average worker over time.	**Positive Exteriorization** Putting into writing a brilliant idea; reproducing another machine part; forming muscle memory from practice.
Negative Interiorization Ignoring exterior causes from a belief that we can change *all* of our reality by recognizing the exterior as illusory; paranoid interpretations.	**Negative Exteriorization** Operating with limited intention because one thinks thoughts are only products of brain chemicals reacting to exterior stimuli; computer hacking a benevolent charity's website.
Drives of the Individual-Collective Duality (Times Health-Pathology)	
Positive Individuation Honoring individual choice; respecting the individual perspective for its partial truth.	**Positive Collectivization** Contributing to social value; learning the language of the collective; openness to learning from another person.
Negative Individuation Alienation from the collective; not honoring the partially-valid individual perspective.	**Negative Collectivization** Indiscriminately accepting all individual choices as equally valid; destructive herd behavior.
Drives of the Internal-External Duality (Times Health-Pathology)	
Positive Internalization For society, taxing gas to make drivers bear costs of pollution; taking responsibility for a mistake.	**Positive Externalization** Releasing limiting thoughts; firing an incompetent worker; the destruction of a virus by antibodies.
Negative Internalization Absorption of pollution by an innocent bystander; feeling guilt for what is beyond one's control.	**Negative Externalization** The loss of awareness from a peak experience; Projecting beyond oneself one's own repressed issues.

Drives of the Higher-Lower Duality (Times Health-Pathology)

Positive Ascension	**Positive Descension**
Releasing attachment to a literal notion that demons cause illness in order to open to the germ theory of disease; emergence of a higher capacity.	Enjoying to eat healthier such that the lower hunger drive is satisfied with rational understanding of health; relativistic-level parents teaching traditional-level children to recycle.
Negative Ascension	**Negative Descension**
Denying an ability to attain higher awareness with transformative practice (rather, thinking only through death or by miracle can one go higher); blind obedience to higher-level authority when one knows better.	Denying greater potentials of the lower (e.g., one *must* abstain from sex to transcend lower expressions of it); a rational-level holon disallowing the expression of feelings.

Source: Adapted from Bowman (2009, p. 18).

Once one accepts the usefulness of making static and dynamic distinctions, the dynamic drives follow naturally from Wilber's writings as the examples in Table 1 convey. First I will focus on the horizontal realms and drives. Recall from above, the reference to healthy and pathological autonomy and communion (Wilber, 1995, p. 48-49). Their meanings clearly imply actions relating to the static duality of individual-collective. (See Bowman 2009 for a detailed discussion). A constant theme for Wilber is how AQAL aids the user to see reality in more of its dimensions thereby fostering a healthier and more balanced holarchical use of its realms (which are created by crossing dualities). Similarly, Edwards (2010, p. 7-8) argues that metatheory such as AQAL is capable of specifying strengths and weaknesses of the unit-level theories it integrates. Flatland reductionism to the exterior domains as in scientific areas dominated by positivism and empiricism (Wilber, 1995, p. 450) is contrasted with broad science (Wilber, 2000b, p. 74) that recognizes interior and exterior dimensions and scientific methodologies to appropriately access them. Since the internal-external duality is not as well integrated into AQAL, I draw on Pigou's (1932) seminal work on positive and negative externalities and internalities.[5]

Moving onto the vertical dimension, we see references to vertical drives and vertical levels in healthy and unhealthy manifestations. Wilber contrasts healthy agape or compassion in the descending direction versus unhealthy thantos or repression in the descending direction. In the ascending direction, healthy eros is offset by pathological phobos (Wilber, 1995, p. 348-351). Regarding health and pathology by specific level, Wilber (1995) and Beck and Cowan (1996) discuss healthy or emergent capabilities at a given level in contrast with problems at a given level that may necessitate growth to a higher level to overcome. Edwards (2010) also describes new powers and problems associated with the various levels of organizational development.

One could provide an example per dynamic drive that relates to a particular subject and another for a related object. In Table 1, this is done for one drive for illustration, but only one drive for conciseness. For instance, an economist as a subject studying the economy may experience positive interiorization as she intuits a new insight that solves a difficult puzzle in the literature on labor market participation and wage rates (positive interiorization in the subject). Alternatively, the object of study may be the productivity improvements that result from a transformation in consciousness of the average worker over time (positive interiorization in the object). This example again brings out the fractal nature of working with this model. The object just mentioned is its own subject (the average worker making choices) that dynamically interacts (transforms) with objects (more productive machines). This subject-action-object triad is itself an object that is dynamically engaged by the subject economist during her study.

---

[5] See Bowman (2009) for more on the justification for these dynamic drives as correlated with Wilberian dualities. Included are some references to how others have also used them such as Carl Jung and Jean Piaget.

ISP (Figure 1) and the holarchical drives (Table 1) are linked with the static-dynamic duality. The dynamic dualities (interiorization-exteriorization, internalization-externalization, individuation-collectivization, positive-negative, ascension-descension, and subject-object interaction) correlate directly (and respectively) with the static dualities (interiority-exteriority, internality-externality, individuality-collectivity, health-pathology, height-depth, and subject-object embeddedness). Thus the dynamic dualities specify the action between subject and its object environment while embeddedness relates to one another the holarchical location of the subject and object that are interacting.

Holarchical field theory is the result of this linking ISP and the dynamic drives. For this branch of Wilberian metatheory that I have offered, no longer is the fundamental unit holons (Wilber, 1995), nor perspectives (Wilber, 2002, 2006), but instead holarchical fields formed by interpenetrating classes of drives between holarchically-embedded subject and its object environment. Notice that HFT does not merely embed the subject in on object environment in only a relative, otherwise ungrounded manner, as when a reader of literature is embedded in a culture by a postmodern analyst. Instead, both the subject and object are each holarchically embedded and as a result of their relative position in holarchical space (each can be described independent of each other). Their potential fields within this setting then provides certain probabilities of various actions, theoretically. The field construct transcends and includes the relatively static descriptor, holons, and one of their dynamic actions, perspective-taking. According to Smith and Smith (1996), a definition for a field that is applicable to all social and natural sciences was given by English and English (1958, p. 207): it “substitutes events for things having fixed properties, and sees events as totalities in which parts of the event are what they are, qualitatively and quantitatively, only in terms of the rest of the event.” Such an approach is needed to examine complex actions. The formal action examined thus far using Wilber’s integral mathematics has been limited to one holon taking a perspective, which discloses an aspect of an object.

Holarchical field theory can be used to distinguish and relate state versus action developmental theory. Holarchical embeddedness is described relatively intensely by state development theory, which focuses on the capabilities that develop in sequence in various lines of development. For examples, Piaget (1977) and Aurobindo (n.d.) studied cognition; Kohlberg (1981) and Gilligan (1982) morals; Graves (2005) and Beck and Cowan (1996) values; and Lenski (1970) and Marx (1977) techno-economic base. Action developmental theory describes relatively intensely the guiding strategies or action logics associated with different stages of individual or collective development. Examples include the action inquiry of Torbert’s (1976, 1991, 1999) and the action science of Argyris’ (1996; Argyris and Shon, 1996).

An increase in integral tendencies in culture (a transformational influence) could contribute potentially to a more meaningful and sustainable society for first-tier agents, not just integral-stage agents. The full specification of dynamic drives fosters examination of these subtle differences in emphasis (translation, transcription, and translation). Integral agents could invest in their own skills to further develop (positive ascension), or they can invest in skills that can contribute to healthier actions of First-Tier agents (positive descension). The concept of *holarchical development* is intended for just such differentiations. It can be represented by Figure 2, which shows, roughly, a hypothetical case of balanced development. With balanced development, there is positive development in all holarchical directions. This follows Wilber's (2000a, p. 198) statement that nested pyramids could also represent his many-leveled, four-quadrant diagram. A deeper (North-South) pyramid is from positive individuation and collectivization. A wider (East-West) pyramid is from positive interiorization and exteriorization. A taller pyramid is from positive ascension, and a steeper slope is from positive descension. The process also involves positive internalization and externalization such that greater potential is realized within the boundaries of the pyramid and positive externalization where the obstacles that prevented that growth are eliminated or related external holons also benefit.

Balanced development, however, is not necessarily the case, nor is it even typical. The model must allow for developments that are intensive in the various holarchical directions as with the finding by Beck and Cowan (1996) that stages alternate in emphasis of autonomy (positive individuation) and communion (positive collectivization). Consider also Wilber's descriptions of the dignity and disaster of modernity. He writes that development at the rational stage has occurred disproportionately in the exterior realms with even pathological differentiation and atomistic conceptions of reality (development with a heavy combination of positive and negative exteriorization and individuation). Similarly, postmodernity contributed to development with an emphasis on the cultural quadrant, but has overplayed its significance such that hierarchical stage theories and logical analyses are deconstructed without reconstruction.[6]

---

[6] See Bowman (2009) for a description of the partially valid critiques of Wilber's AQAL model, which can be grouped as the ascending-bias criticisms. There I describe how the dynamic drives can be derived from Wilber's writings to increase AQAL's internal consistency and better differentiate the vertical directions of development. This at least partially overcame AQAL's ascending bias without succumbing to the pre-post fallacy (that is, without elevating pre-conventional tendencies to post-conventional or reducing the post to pre).

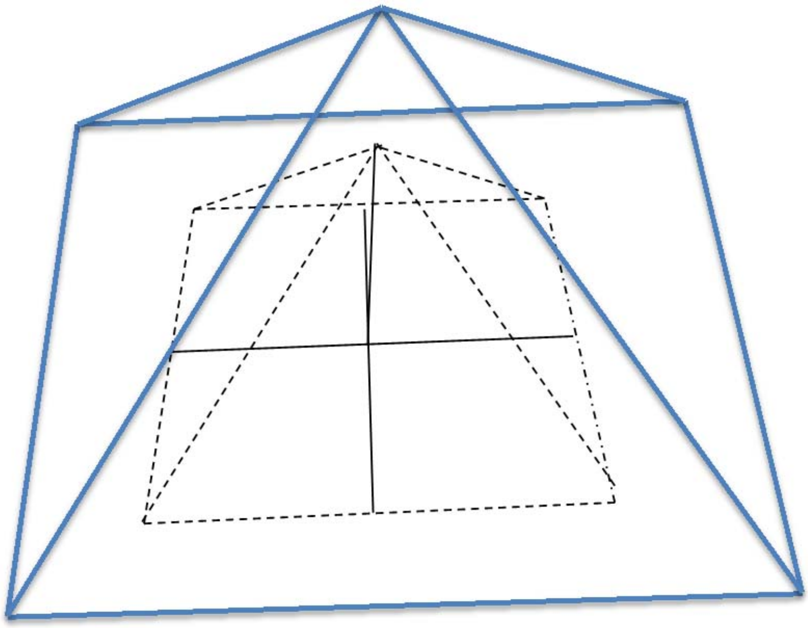

Figure 2: *Balanced development in each holonic direction resulting in a larger pyramid.*

HFT as a Metatheory Bridging AQAL and Social Science Field Theory

Here I use Mark Edwards' (2010) metastudy of metatheories and his own metatheory to help orient holarchical field theory (HFT) within the metatheoretical literature. This also provides insight into HFT's extensions of AQAL, which builds bridges to field theories in the social sciences. I will focus on the field theory of Kurt Lewin (1939, 1951) and some of its more contemporary influences.

Overton (2007) distinguishes ordinary theory from the conceptually higher-level metatheory. Ordinary theory and methods use the empirical world as its subject matter, while metatheory and metamethods take the ordinary theories and methods themselves as the subject mater. Edwards (2010) worked on yet a higher conceptual level as he compared different metatheoretical models and methods including those classified as traditional meta-construction, the dialectical method, metatriangulation, metaparadigm inquiry, and metatheorizing in sociology. The traditional meta-scholarship relies on a theorist's broad reading across many related disciplines and his or her intellect and intuition to build a large theoretical framework. Although important connections and models can result, the method lacks transparency and repeatability.

The dialectical method (e.g., Marx, 1977) resolves opposing perspectives through rational dialogue. According to Paolucci (2003), Marx's method involved inquiry, conceptualization of core elements, case comparisons, deductive analysis and provisional abstractions, model building, evaluation, presentation, and continued inquiry.

Edwards concluded that only metatriangulation could claim to be a systematic research method for metatheory building. Its three phases are groundwork, data-analysis, and theory building as in the work of Lewis and Grimes (1999). For Edwards, multiparadigm inquiry (Lewis and Kelemen, 2002), with similarities to the approach of Ritzer (1991, 2001), is a complementary tool for comparing theories and metatheories given its comparisons of "underlying themes and key conceptual factors" (Edward, 2010, p. 85).

Edwards' own metatheoretical method is an extension of the systematic metatriangulation method. Edwards' extensions help overcome the inability of metatriangulation to widen the range of existing paradigms and lenses. Edwards found all four metatriangulation studies within his chosen domain (organizational transformation) to rely on the four paradigms (interpretive, functionalist, radical humanist, and radical structuralist) specified by Burrell and Morgan (1979). Saunder et al. (2003) also recognized the problem of the reproduction of existing paradigmatic relationships in studies using metatriangulation. Edwards' resulting eight phases of his metamethod are groundwork, domain specification, design, multiparadigm review, multiparadigm analysis, metatheory building, implications, and evaluation.

Edwards places Ken Wilber's method in the traditional category. Edwards adds transparency by pointing out the characteristics of the formal and informal aspects of the theory. Edwards recognized the four quadrants as a crossing of two dualities, a method used to synthesize various perspectives in other studies. Of course, in the case of AQAL's four quadrants, individual-collective is crossed with interior-exterior to form four areas (the individual, interior quadrant; the individual, exterior quadrant; the collective, interior quadrant; and the collective, exterior quadrant). Thus the method of, and value from, using formal dualities that Edwards specified is consistent with the method of, and value from, what I specify as integral scientific modularity. ISM also improves upon the transparency of Wilber's work and HFT by extension. Integral scientific modularity is a more generalized argument that includes the formal and informal aspects of AQAL. When used successfully, Wilber's method of referencing claims across disciplines and methods contextualizes one another and do not necessarily require formalization, as Edwards uses the concept, in order to better judge the partially valid from the partially invalid conclusions. Judging by a broader survey of cross-disciplinary and cross-methodological studies helps one overcome results from unjustified assumptions while honoring those that result from state-of-the-art scientific inquiry. Furthermore, HFT formalization of what were informal relationships in AQAL by using the (bipolar, triadic, or spectral) crossing method is sanctioned by Edwards' meta-analyses. The domains of HFT represent an unprecedented level of differentiation and integration as measured by the number of dualities, triads, and spectra simultaneously crossed with its results systematically described and theoretically supported. Improved internal consistency, as described in later sections, provides some confirmation of the appropriateness and fit of the HFT extensions of AQAL.

Recall that HFT formally includes some conceptual lenses that were used informally in AQAL (internal-external, health-pathology, and subject-action-object). We can add to this list the autonomy-communion duality (an added lens labeled as informal in AQAL by Edwards, 2010, p. 217). The static-dynamic formalization of HFT pairs the dynamic drives of autonomy and communion with the static realms of individual and collective thereby formally integrating the autonomy-communion duality.

The perspectives lens is also informal in AQAL according to Edwards. In HFT perspectives may be considered informal as well, yet they take on more detailed meaning. They are the subject views that result from certain field action in given object environs. This type of perspective talking (action) is a general use separate from first-, second-, and third-person perspective taking, which will be examined in later sections.

Also consider the other lenses listed by Edwards as informally used in AQAL: transformation-translation, inclusive emergence, exchange relations, transition process, and spirituality. Furthermore, consider conceptual lenses identified in Edwards' metastudy that are not included in AQAL formally or informally: social mediation, learning, system dynamics, alignment, stakeholder, decentering, evolutionary process, and governance hierarchy.

Comparing the lenses that are formally included in AQAL versus those that are informally or not included suggests that AQAL is more closely related to static developmental rather than dynamic developmental theory. The later more typically works with the omitted lenses (although not always formally). Interestingly, those dynamic developmental theories specified in the previous section (action inquiry and action science) share an important lineage going back to Kurt Lewin's field theory (Burnes, 2004). The action science of Argyris (1990) and organizational dynamics of Hirschhorn (1988) helped renew interest in field theory. O'Connor (2008, 2010) shares an interest in better incorporating insights from action science into the AQAL framework. He has correlated three types of organizational guiding strategies by level of development. So although many lenses are not formally included in HFT, many of them are more accessible with the field-theoretic approach of HFT.

Lewin is considered the father of social psychology and famously worked to reconcile a divide in psychology at the time between the influences of nature and nurture on behavior (Brown, 2011). Lewin (1951) conceptualized and empirically found behavior to be a function of the individual and his or her environment. For him it was necessary to include all relevant individual and environmental factors including psychological, biophysical, and socio-cultural (i.e., Wilber's four quadrants). Lewin (1951) also did important work in analyzing vertical development and regression with an emphasis on differentiation and integration. Field settings also bring out different aspects of an individual's personality. Perceptions, feelings, and actions of the individual were grounded in group membership (in family, work, church, school, etc.), norms, roles, socialization, interaction and change.

The group is a broader and more flexible unit in Lewin's field theory than in Wilber's AQAL. Wilber stresses same-level relational exchange where, for example, rational stage individuals tend to be associated with rational-stage collectives. For Lewin, it is not the similarity or dissimilarity of individuals that constitutes a group, but interdependence of fate. When there is interdependence in the goals of its members, group behavior can be cooperative or competitive potentially stimulating movement towards attaining goals. In his analyses, group atmosphere can vary in friendliness and group governance can range from laissez-faire to democratic to autocratic (Smith, 2001).

Goals, aspirations, and expectations are central to Lewin's approach to behavior at a time when those issues were considered non-scientifically accessible. Lewin's work on boundary issues clarifies the need to formally include the internal-external boundary while specifying key relationships among holons. In ISP, it is essential to specify the subject's relevant object environment. The horizontal and vertical drives make connections between subjects and objects within and between levels of development and should not be limited to same level relational exchange. This approach better asks how an integral culture would better align the drives of agents and different first-tier stages for the health of the given holarchical life space.

Gold (2002) described Lewin's metatheoretical approach as, not technically a theory or method, but a set of rules for building sound theory. The rules are: i) create constructs, ii) include dynamic relations where a change effects each relevant component, iii) start with the situation as a whole (the field component), iv) assume contemporaneity (the past or future only affect a situation if they relate to a present specification), v) formalize if possible but it is not required if the theory is not mature enough in a given area, vi) use a psychological approach (perceptual and cognitive processes are related to outer events in the physical, psychological and social environment). Gold argues that Lewin's psychological side of the theory is more formal than the social side. For the psychological side, Lewin defines primitive terms, posits their axiomatic relations, and generates logical axiomatic combinations of the primitives. This approach is underdeveloped on the social side. A key to advancing the field approach is in the formalization of the boundary issues and holarchical field theory helps provide some insight. In Gold's writing, the boundary problem, or the "reciprocal influences between the individual and social environment," takes on the character of the individual-collective distinction. This implies that the linkages between psychological and behavioral events are more formally analyzed. Gold argued that more work is needed to expand on Lewin's social concepts (social space, gate keeper, group atmosphere) while incorporating probabilistic and stochastic collective facts.

HFT incorporates the internal-external duality requiring a specification of a boundary between holons in each quadrant (psychological, behavioral, cultural, and social). This and the related classes of drives is offered as a potential tool for organizing developments in modern field theories, action science, action inquiry, and complexity theory. Bion (1961) drew on Freudian and Lewinian theory in his influential work on unconscious aspects that often undermine group performance. Rummel (1975, 1976, 1981) developed a sophisticated field theory that drew on the field theories of Lewin, Sortkin (1969), and Ushenko (1946), among others. Rummel provided an updated philosophical grounding aimed at reconciling opposing philosophical approaches. He also expanded on the vector field approach conceptually and with updated empirical specifications.

Applying part of this approach to HFT, a holarchical vector field may be used to chart dynamic interactions among the subject and object environment. The dynamic drives are classes of holarchical vectors (which specify holarchical direction and magnitude). For example, interiorization is a holarchical direction through the interior holarchical realm. It is a class of drives, meaning that other individual, interior aspects of drives relating to aspiration, expectation, perception, thought, and so on, fall within the interiorization class. But they may be related to other realms. For example, a subject may aspire to know an idea or to acquire an object. The interior-individual aspiration is a drive that tends to propel the subject to action such as reading to learn the object idea or work to earn money to buy the object. Thus the object selected by the subject and method can be in different realms. (The example in the appendix brings out some more of these issues). Those with highly developed interiority are capable of harnessing and controlling strong drives relating to the interior realm. More work is needed to formally tie together holarchical embeddedness in various basic and learning lines along with their related drives in various environments. For example, static cognitive developmental theory can describe *how* one tends to think at successive stages, now *what* one tends to think (Rosenberg, 2002). A dynamic, field approach is needed for better understanding of what one tends to think in various circumstances.

Complementary drives may amplify each other while opposing drives may dampen each other out. The 20 Tenets provides some theory about the actions that foster further development. Development may result from, for example, reconciliation of polar drives with a mutual orientation of their appropriate holarchical scope, including their partially valid parts while limiting their overstretched applications. This guides us to existing potentials that may be within a holon's zone of proximal development. For example, does the cultural drives in the group complement the individual's potential drives associated with satisfying his or her goals or needs? What barriers are involved in the various ISP realms? How can holarchical embeddedness of the relevant objects be best harnessed for mutually beneficial action? Can we better recognize and empower the complementary drives? What are the state-of-the-art methods that can empower tendencies into successful drives? How do we spot shadow elements as the root of negative drives?

Elrod and Tippet (2002) and Rosch (2002) see complex adaptive systems theory as an intellectual heir of Lewin's field theory. Argyris et al. (1985) and Shein (1988) have acknowledged the important influence Kurt Lewin has had on their own action science scholarship. Lewin, by the way, coined the term action research (Smith, 2001). In their work on organizational identity, Meyer et al. (2002) make use of Lewin's quasi-stationary equilibrium concept.[7]

Kurt Lewin's field theory and Ken Wilber's AQAL are better grounded in psychology as they ventured into collective realms. Pierre Bourdieu's (1984) field theory, in contrast, is grounded in the sociological tradition with special emphasis on power relations and the way field positions (including class differences) influence motivations, incentives, and power dynamics (Swartz, 1997). Sociologists Fligstein and McAdam's (2012) recent work in field theory is also firmly in the sociological tradition. Relative stakeholder positions, especially between incumbents and challengers, play key roles in the theory.

Perhaps HFT can provide conceptual tools and help further develop other efforts to utilize AQAL for dynamic analysis. In one such effort, I integrated the input-throughput-output triad by using a production function that converted four-quadrant capital into four-quadrant goods and services used to satisfy hierarchical needs (Bowman, 2008). Elsewhere, I made stakeholder interaction an important part of my analysis of public economic policy (Bowman, 2010a, 2010b, and 2011). Various stakeholders (business groups, environmental groups, political parties, and average consumers and voters) were considered as influential on public economic policy based on their degree of health and development in the political-economic learning line (which consists of the conservative, liberal, and radical typologies). O'Connor (2008, 2010) made use of simple and higher-order learning modalities of organizations at three different levels of development in his unique use of AQAL. For researchers who have categorized disciplines or issues by quadrant, HFT encourages them to go deeper to disentangle and relate static and dynamic issues in different settings, and to use newly integrated theories in detailed analyses rather than stopping at topologically relating them.

---

[7] See Burnes (2004) for a discussion of Lewin as his field theory relates to modern strands of research on change dynamics such as organizational development, culture-excellence theory, processualism, punctuated equilibrium models, continuous transformation model, and the power-interaction model. Burnes (2004) and Rosch (2002) both argue that critics of Lewin's approach tend to mistakenly take his approach in a piecemeal fashion. Burnes (2004) and Rosch (2002) also see Lewin's critics as failing to acknowledge the role Lewin has played in influencing later work that expands on aspects of his work.

The remaining sections use HFT to help spot and avoid inconsistencies in the Wilberian literature relating to perspectives, pronouns, and certain dualities. The confusion especially relates to attempts to formalize analysis of communication and action using AQAL (or variations of AQAL). The reader may be interested in reviewing the appendix section at this point or after concluding the article. It is an instructional example to demonstrate all the realms and drives that tend to be engaged during communication or action more generally. The complexity and consistency that is characterized by HFT analysis of action (in the appendix) is in contrast with narrower and problematic analyses of action in the Wilberian literature, which is examined in the remaining sections.

The Philosophical/Grammatical Conflation

O'Connor (2008, 2010) contributed to integral theory by pointing out what he calls Ken Wilber's triad/quad conflation. This conflation is the reduction of the triad perspectives (first-, second-, and third-person perspectives) to the four quadrants. With the upper-left (UL), individual-interior quadrant, Wilber correlates a first- person perspective and first-person language represented by the pronoun 'I'. A second-person perspective and the 'we' pronoun is correlated with the lower-left (LL), collective-interior quadrant. Lastly, a third-person ('it' and 'its') perspective is correlated with the exterior quadrants ('it' for the upper-right quadrant, UR, and 'its' for the lower-right, LR). Esbjorn-Hargens' (2006, pp. 88-89) follows this association by calling the two methodologies in the UL first-person methods, the two in the LL as second-person, and the four in the exterior quadrants as third-person.

Grammatically, 'I' is a first-person singular pronoun, but O'Connor points out that 'we' is a *first-person*, plural pronoun, not a *second-person*, plural pronoun because 'we' implies a perspective directly experienced by the speaker. To add to the confusion of Wilber's integral mathematics, Wilber (2006, p. 40) not only rigidly associates a first-person perspective with the interior realms, but also the inside realms, what I have defined identically as the internal realms.

I agree with O'Connor that there is confusion of quadrants and person perspectives. It makes integral mathematics very difficult to understand and use, as I will show in a later section. Yet there are still fundamental problems with O'Connor's alternative use of pronouns and person perspectives. He claims, through his version of integral semiotics, that there is a first-person perspective associated with each quadrant as seen in Table 2. There is a first-person singular subject ('I' of the UL), a first-person singular object ('me' of the upper-right, UR), first-person plural subject ('we' of the LL), and a first-person plural object ('us' of the lower right, UR). Similarly, there are second-person and third-person perspectives in each quadrant (see Table 2). O'Connor also establishes the possessive pronouns that relate to each of the twelve realms created by what he calls the "triadic-quadratic" perspectives. These are shown in the parentheses of Table 2.

Table 2. O'Connor's Problematic Triadic-Quadratic Perspectives.

	Interior or Subjective	Exterior or Objective
Individual or Singular		
3rd Person	She/He/It (Her/His)	Her/Him/It (Hers/His)
2nd Person	You (Your)	You (Your)
1st Person	I (My)	Me (Mine)
Collective or Plural		
3rd Person	They/These (Their)	Them/Those (Theirs)
2nd Person	You (Your)	You (Yours)
1st Person	We (Our)	Us (Ours)

O'Connor conflates the philosophical subjective-objective duality as directly related to the grammatical subject-object duality. The subject pronouns are used as subjects of a sentence, the element that agrees with the verb (as with 'He' in the sentence 'He ate it' to denote that 'Bob ate a meal'). The object is the element that is not the subject but that which the verb selects or requires ('it' meaning 'a meal'). Thus, O'Connor is using subject-object in its *grammatical sense*.

In contrast to the grammatical subject, subjective in the *philosophical sense* is an understanding or statement that depends on one's own experience, as with the statement 'blueberries taste better than strawberries.' Objective understanding (philosophically) does not rely on personal experience, as with the statement 'the floor of my front porch is not completely level.'

Wilber is justified to suggest the interior realms relate to one's own experience or perspectives that are philosophically subjective (intentions, values, emotions, thoughts, and so on) or intersubjective (mutual intentions, mutual understanding, mutual values, etc.). The exterior realms are philosophically objective (behavioral capacities, cognitive processes, and so on) or interobjective (infrastructure systems, voting procedures, etc.). This does not imply, however, that one can link O'Connor's use of grammatical subject-object with the interior-exterior duality, which is critical to O'Connor's claim of reunifying Wilberian and Habermasian metatheories. O'Connor proposed the use of his triadic-quadratic perspectives with the guiding strategies of action science by level of development to analyze action, but without formally demonstrating how.

This erroneous, rigid correlation conflates the philosophical subjective and objective definitions (from above) with the grammatical definitions of subjective (of or relating to a grammatical subject) and objective (of or relating to a grammatical object). In my interpretation, Wilber's concepts of broad science (2000b) and integral methodological pluralism (2002, 2006) are used to differentiate the dual meanings of the subjective-objective duality. Interior ('philosophically subjective') phenomena can be studied as 'grammatical objects.' Established interior methodologies access 'philosophically subjective' states and then generate 'philosophically objective' data. For instance, the data may include written answers to sentence completion tests. Analysis and comparison of many individuals may reveal interior, sequential structures of development. Such tests have led to the conclusion that transformation to another stage can be described as making what was formerly the ('grammatical') subject of one's interior awareness a ('grammatical') object. Notice the 'grammatical' use of subject-object by Kegan (1994); he describes vertical transformation as "liberating ourselves from that in which we were embedded, making what was subject into object so that we can 'have it' rather than 'be had' by it" (p. 34).[8] So for Kegan, interior elements can be grammatical subjects or objects.

In ISP and HFT, I follow Wilber in associating the philosophical subjective-objective duality with interior-exterior. But I have decoupled the grammatical subject-object duality from the interior-exterior one consistent with Wilber's "broad science" concept. The grammatical subject-action-object triad was crossed with the eight zones to form ISP. To rigidly link these dualities (as in Table 2) can be termed *the philosophical/grammatical conflation.*

Notice also that the scientist can be seen as an eight-zonal subject who *'does'* science with potentially eight classes of methods to disclose scientific objects, potentially in eight zones. The method is the dynamic action, which *agrees with* the subject. The object of study is that which the subject *selects* with the method. Thus the subject-method-object triad relates directly to a grammatical interpretation, not a philosophical one. As shown in the next sections, this has important consequences for the use of pronouns and analysis of action in the integral literature which should help to channel the energy created by IMP while clearing the fog that Integral Mathematics (IM) simultaneously brought with Wilber's latest phase of AQAL theorizing.

Edwards (2003), the esteemed metatheorist I have relied on in the previous section, shared with O'Connor an attachment of 'me' and 'us' to the exterior while 'I' and 'we' are associated with the interior. He describes 'my behavior' as 'me,' for instance. But why can't my interiority be 'me'? I can see myself as someone who is reflexive on my good days and I hope my friends see 'me' this way at times too. Reflexivity is treated as an interior-individual object disclosed primarily by my employment of phenomenology in the case of me seeing myself this way since the object is internal to my awareness. In the case of my friends seeing me this way, it is an interior-individual object disclosed by my friends' informal structuralism, primarily, given that my reflexivity shows up in a realm external to me. This approach helps build a better understanding of complementary methods, which allow for mutual understanding in the lower-left quadrant.

---

[8] Both articles by O'Connor that I have cited have won honors at the Integral Theory Conferences of 2008 and 2010 (see for example, Integral Theory Conference, 2008). I point this out merely to demonstrate the attention these articles have drawn in the integral community and therefore, some value in pointing out its errors.

One value in specifying person perspectives is to keep track of the multiple holons engaged in, or referenced in communication. Singular and plural pronouns do indicate, respectively, singular or collective holons, but verbs (whether they are state or action verbs) and other grammatical components can be critical for relating grammatical subjects and objects to the quadrants. Consider ‘My brain is wired poorly’ versus ‘Clarity expands my mind.’ The subject in the former sentence is a stated exteriority in integral theory, and the object of the latter sentence is a stated interiority. So grammatical subject cannot be reduced to the interior quadrants and again suggests a decoupling of grammatical subject-object from philosophical subjective-objective. To conflate them seems to reduce away needed subtleties in what O’Connor hopes to construct, an integral theory of action and communication.[9]

Wilber’s use of pronouns differs from O’Connor’s. Justification for Wilber’s association of ‘I’ with the UL, ‘we’ with the LL, ‘it’ with the UR, and ‘its’ with the LR is not entirely clear. Why does my use of ‘I’ and ‘we’ generally refer, respectively, to my and our interiority? Consider, for instance, the sentences ‘I intend to study’ versus “I need to smoke.’ The former sentence implies an interior intention of the subject and the latter a behavioral habit being performed by the subject. Who is doing the intending versus the habitual action? A holon who exists in all four quadrants (having an UL mind and an UR brain while being embedded in, and influenced by, various LL cultures and LR societies) and who acts in different instances with varying degrees of intentional, behavioral, cultural, and social influences.

Does Wilber mean that whenever one uses the term ‘I,’ it implies an interior awareness of something? This is an appropriate interpretation in ISP. When the realms of ISP refer to the speaker of the sentence who utters the word ‘I,’ then ‘I’ can represent a subject who is subjectively experiencing a phenomenon. Wilber is using the terms ‘I’ and ‘we’ less formally than I am here. Yet in keeping with the critiques of O’Connor and Edwards, integral theory may be better off taking a more formal approach. I will show in later sections that Wilber strictly correlates the first person to the interior and third person to the exterior in his use integral mathematics. Many problems result with his slide from an informal and lose correlation to a strict and formal correlation between perspectives and quadrants. So I shall continue with a formal approach to help the reader recognize and overcome such problems.

If I attempt to describe to you, your subjective experience of cooking last night, then this experience of cooking is a second-person perspective for me. The cooking experience is a first-person experience for you. Yet the objectification of it in my awareness is a first-person experience for me. To the extent we understand the experience, this understanding is a collective, interior, internal experience. Again, in a less formal approach, it appears that Wilber uses ‘we’ to indicate that we are aware of the same thing such that I can identify with your perspective, which is second person to me. Thus ‘I can take a second-person perspective.’ But these are particular, not general uses of how ‘we’ and ‘second-person perspectives’ are used. When I state to you that

---

[9] The O’Connor pronouns in Table 2 can be appropriately presented as a crossing of two specific dualities [grammatical subject-object (not interior-exterior), and singular-plural or individual-collective] with the triadic person-perspectives (first-person, second-person, and third-person). The cells created, however, are not connected to Wilber’s four quadrants of intention (UL), behavior (UR), culture (LL), and society (LR) in the direct way O’Connor proposes. The next section describes how qualifications are needed if we use pronouns and perspectives in ISP realms.

'We both jog along the lakefront' or 'I jog along the lakefront,' the intension is for you to join me in my understanding of the sentence. The 'we' pronoun does not uniquely represent this in these two sentences. A simple reply of 'yes' by you in either case would indicate that 'we both understand that we or I jog along the lakefront.'

Therefore, Wilber's (2000b, p. 154) use of 'we' as a first-person plural pronoun and correlated with 'you' as a 'second-person perspective" to represent the LL means that the LL for 'me' can be thought of a perspective that 'I' (first-person) and 'you' (second-person) share ('we' share the perspective) if you and I can inhabit the same cultural space to allow for this shared understanding. Nonetheless, we need to clearly differentiate the internal and external aspects of these quadrants and avoid universalizing Wilber's use of perspectives and pronouns to all uses of quadrants. This problem of overgeneralization becomes apparent in the next two sections.

Pronouns and Person Perspectives in ISP and HFT

Recall the earlier distinction between static and dynamic developmental theories where the former relates closely to holarchical embeddedness and the later to dynamic engagement of holons. Static and dynamic language can be similarly categorized. Static (or state) language is related relatively more to holarchical embeddedness and dynamic (or action) language to the dynamic interaction of engaged holons. State language is used to describe subjects or objects in a particular state (or relatively static point in time). In the sentence, 'He is tall,' 'is' is a state verb. It describes, in this case, the subject in a relatively static, physical state. 'Ran' on the other hand is an action verb. Action language includes action verbs, action adjectives, and so on.

This section further demonstrates that person perspectives and pronouns cannot be reduced to particular AQAL or HFT realms without qualifications. First I will choose specific subject-verb-object language that can represent the meaning attached to specific ISP realms. Then I will provide an example of language that would overlap multiple zones. In order to do this, I must decompose the internal-external dimension into three parts: internal, mesoternal, and external. *Mesoternal* is defined as a situation that may have internal and external relations. Therefore, a mesoternal situation can be described as subject and object sharing some internal and some external aspects.

From the subject's perspective, we can associate the first-person perspective with the internal realm. For example, 'I observe my thoughts' is a sentence where all elements belong to the same zone, zone 1 of Figure 1 (the same slice of the ISP pie). The sentence suggests an interior awareness for the subject-verb agreement, and the object selected is also an individual, interior aspect internal to the individual. The subject, action, and object are first-person experiences to the speaker of the sentence. Now consider the sentence, 'You intend your intentions.' Here, mesoternal matches the second-person perspective. The subject-verb combination suggests interior action of the subject. The object selected also involves an interiority of the same individual. Yet, the individual having the experience of intending intensions is second person to (and therefore one step removed from) the speaker. The experience referenced applies to the second person, which means it is *external* to the speaker, yet the subject of the sentence and the speaker are *internal* to the conversation. Second person suggests external *and* internal aspects, which I called *mesoternal*. Figure 1 does not have slices for mesoternal. We could add a mesoternal slice to represent the second-person perspective in each quadrant. I choose not to provide a figure given that language does not always fit neatly in these realms. This section is merely offered as an aid in avoiding using pronouns, dualities, and perspectives in a reductionist way when using Wilberian theory.

Relative to the subject speaker, the external realm is the location of the third-person perspective because the third person referenced and the perspective are both external to those conversing. An example from the external, collective, interior dimension could be the statement, ‘They agree on their ethics.’ The subject and object referents are external to the perspective of the speaker and external to those conversing (two perspectives removed from the speaker). An example of a sentence entirely within the internal, first-person, exterior zone is ‘My brain processes information bits.’

I demonstrated that from the subject’s perspective, one could associate the first-person perspective with the internal realm; second person is associated with mesoternal realm; and third person with external. The holonic boundary can slide, however, if we define it as including more members, such as those being talked about, but not talked to. Returning to the initial reference points, the association of first-, second-, and third-person with internal, mesoternal, and external will continue to be the case even when we do not rely on examples of sentences that have all of their elements within one zone (or slice). In other sentences, the object selected can fall into a different zone compared to the subject-verb agreement as with ‘I observe his behavior.’ This use of ‘I observe’ suggests the subject’s interior interacting with an exteriority of a third-person, a person outside or external to the conversation. Thus the object, ‘his behavior,’ is in another zone. The observation, or the subject-verb of ‘I observe,’ was first-person to the speaker, but the object is third-person to those engaged in the conversation. Here, nonetheless, one can still see the consistency in attaching perspectives with the internal-external spectrum. From the speaker’s perspective, the first-, second-, and third-person perspectives can be directly associated with the internal, mesoternal, and external spectrum, respectively, when analyzing language. But one cannot reduce the person perspectives to the internal-mesoternal-external triad, because from another person’s perspective, internal, mesoternal, and external will have different meanings. Also, one may choose to define the boundary of the holon differently.

Notice that if I stated, ‘We share integral values,’ then the subject of the sentence is a first-person, collective pronoun. The subject and verb are collective (plural), interior elements. But it is a first-person experience because it indicates my experience or view of us having integral values. The object selected is also in the interior, collective domain.[10]

Language incorporates the field aspect of subject-object relations or interactions engaged by the verb. (I use the word *engagement* here to indicate either state or action relations). Again, a static statement reflects holarchical embeddedness, yet we may still interpret a static sentence as a movement through time in a relatively fixed and stable manor. To maintain a state actually requires self-preservation drives of the holon in equilibrium with the drives of its environment. One can see that engagement can be described within or across zones (slices). This shows the range of engagement within or across certain holarchical boundaries given by the internal-mesoternal-external triad. Also, holarchical drives will cross from subject to object and from object to subject. In the example, 'My brain processes information bits,' the sentence indicates exteriorization from subject to object and from object to subject. The brain enacts the information and the information transmits to the brain. If I then add, "I conclude that the economy will contract over the next quarter," this implies interiorization from the brain to mind for analysis and prediction. There is also exteriorization of thoughts to words. Thus information was internalized and made into additional, individuated mental information and then externalized and collectivized for the group participating in the conversation. Where HFT would get interesting is by taking into account the various ways in which stakeholder groups or individuals interact by holarchical embeddedness. HFT can help the analyst conceptualize the obstacles and potentials for understanding and action.

---

[10] Here are other examples each coming from the three elements of a particular zone, but zones not yet represented. Zone 7 (from the perspective of the speaker): ‘Our system constrains our physical interactions.’ Zone 8: ‘Their city fits their functions.’ The mesoternal zone in the LR: ‘Your buildings create your workspace.’ Zone 2: ‘She intends her thoughts.’ Mesoternal zone of the LL: ‘You (all) understand your values.’ Mesoternal of the UR: ‘Your habits repeat within your body.’ Again, a subject-verb agreement can select an object from another zone. I provide one added example of this. In this case, the subject-verb comes from zone 4 and the object from zone 6: ‘They agree on her physical handicap.’

In order for the language, however, to clearly signify interior and exterior aspects, I restricted the use of language to specific examples. Components of sentences may overlap these realms. If I say, "I am me," the object I am referring to may comprise interior and exterior elements. I may be referring to my height (an exteriority) or to my ability to make moral judgments (an interiority) or both.

Using Exterior, External, and Third Person Interchangeably and Improperly

Here I will use HFT to point out inconsistencies and errors in Ken Wilber's writings regarding the interior-exterior, internal-external, and perspectives lenses. The relation between subject and object is complex in Wilber's work. "Integral post-metaphysics replaces perceptions with perspectives" (Wilber, 2006, p. 42). "It is not that perspectives come first and actions or injunctions come later; they simultaneously co-arise (actually, tetra-arise). Perspectives simply locate the perceiving holon in AQAL space" (Wilber 2006, p. 34). "Each moment is not a subject prehending an object; it is a perspective prehending a perspective" (Wilber 2006, p. 42). This certainly allows for causally efficacious objects beyond those perceived by the subject, as in my use of HFT. Yet Wilber's examples of integral mathematics (IM) do not bring out these forces.

Wilber's uses of IM limits his view of action to something less than fields. IMP, when housed within ISP and HFT, encourages the formal analysis of primary and secondary methods, for example, that are employed in engagement along with the multi-directionality of interpenetrating drives between holons and their current and potential environments. Unacknowledged, secondary methods and hidden drives are often the source of modern and postmodern biases as was discussed in the summary section. In my view, this is key to Wilber's successful integral methodology, but absent in his use of IM.

The confusion with pronouns and person-perspectives adds to the difficulty in formalizing Wilber's successful, but opaque integral methodology. Wilber tends to use the first-person perspective interchangeably with the internal and interior realms. Prior to examining his integral mathematics, I begin with a relatively simple example of mistaken interchangeability of internal-external and interior-exterior with Wilber's (2000b) integral politics [italics are mine]:

> [W]hen it comes to the cause of human suffering, liberals tend to believe in *exterior* causes, whereas conservatives tend to believe in *interior* causes. That is, if an individual is suffering, the typical liberal tends to blame *external* social institutions (if you are poor it is because you are oppressed by society), whereas the typical conservative tends to blame *internal* factors (you are poor because you are lazy). (p. 84)

Generally he sees liberals as focusing on right-hand-quadrant causes of poverty while conservatives focus on left-hand-quadrant causes. Yet his examples use elements of two different dualities (for the horizontal axis); internal-external and interior-exterior. He even uses all four words (internal, external, interior, and exterior). I agree that religious and socially conservative types often fault the character of the poor for their problems. This does indeed imply a focus on the *interior* realms (values, intentional choices, etc.). Yet his example of liberal focus on problems beyond the poor's control does not imply a focus on *exteriorities*, but rather *externalities*. In contrast to *social-conservative* focus on interiorities, *pro-market conservatives* de-emphasize the problems with market *externalities*, not market exteriorities, which can lead to higher inequality of opportunity and income.

In my integral political-economy approach (Bowman, 2010a, 2010b, and 2011), I make consistent use of the interior-exterior, internal-external, higher-lower, individual-collective, and positive-negative dualities. In Bowman (2010a), one value in decomposing positive and negative internalities and externalities was to show that pro-market conservatives often emphasize positive market externalities (like trickle-down economics) and de-emphasize negative market externalities (like pollution or financial contamination from overly risky private leveraging). It is just the reverse for pro-government liberals. So the root disagreement may really be their well-known disagreement around the private-sector/public-sector duality.

Now moving to integral math, even by Wilber's own admission there are inconsistencies with IM.[11] In a footnote, Wilber (2006) writes:

> Also, 'the inside and outside of the singular and plural' technically are not the same as 1st-, 2nd-, and 3rd-person approaches or combinations thereof, and some severe theoretical problems result if this equation is made. We sometimes use 1-p and 3-p to represent inside and outside views, but this is a concession to popular understanding and not the actual definitions. The quadrants (inside/outside x singular/plural) are much more fundamental and prior differentiations in Kosmogenesis than are 123p (and, in fact, generate them). (p. 42)

---

[11] Integral mathematics is not a mathematical system; it is a notational system. At least as he specifies them, one cannot perform mathematical operations upon the elements of Wilber's abbreviated terms. Bowman (2008) presents an actual mathematical model for an integral approach to economic growth and development.

According to this article's previous section, first-person and third-person views do relate closely to inside and outside views (what I call internal and external views), but only from the perspective of the first-person. Wilber's inconsistent uses of interior-exterior as sometimes interchangeable with internal-external force him to write the imprecise qualification in the above passage. There, Wilber simultaneously refers to his standard quadrants (interior-exterior x individual-collective) and to an alternative quadrant set (internal-external x individual-collective) as interchangeable, which is inappropriate. Thus we do not really know what Wilber's use of a first-person perspective really means. Is it an internal or an interior perspective?

Apparently both. Consider the following (Wilber 2006):

> Using shorthand of 1st person (for the inside in general) and 3rd person (for the outside in general), then introspection, let's say, which is a type of phenomenology (or zone-#1 activity), is when 'I look into my mind'-or, I have a 1st-person experience of my 1st-person awareness, which we would write as 1-p X 1p. (p. 40)

All of the "p's" relate to person perspectives. On the next page:

> In integral math, when we use 3 terms, such as 1p X 1-p X 3p, those terms are usually: quadrant X quadrivium X domain (and "domain" can be a quadrant or a quadrivium). (p. 41)

Wilber (2006, p. 253) defines quadrant and quadrivia. "A quadrant is a subject's perspective; a quadrivium is the perspective the object is being looked at from." Not only do all the "p's" represent some kind of person perspective (first person = 1 and third person = 3), but fundamentally, every term in his IM (as initially presented in *Integral Spirituality*) is a person perspective without direct reference to a quadrant, quadrivium, or domain zone unless it can be gathered from a person perspective. What Wilber seems to mean in the (p. 40) passage above ("I look into my mind") is an internal view of an interior awareness, which are both described as first-person. How would he handle 'his look into his mind'? He would need to call this a third-person perspective, because it is external to the speaker and person spoken to. Yet he would also need to specify the view as 'interior to him' to differentiate it from an 'exterior aspect of him.' But Wilber always reduces third person to external *and* exterior.

I much prefer Wilber's notation, which omits person perspectives, and instead specifies Kosmic address concretely by quadrant, level, line, state, and type for subject and object. This is done much later (and much less frequently) in *Integral Spirituality* (pp. 264-266). This notation is the type that can be more readily updated with the insights from HFT (such as using eight zones rather than four quadrants for both the subject and the object, including relevant secondary methods from subject to object, and tracking bilateral drives between object to subject not necessarily consciously perceived by the subject).

The inconsistencies with these integral lenses seem to affect Wilber's choices of examples when describing IMP. With his first published introduction of IMP and IM, Wilber (2006, p.36) writes, "I can approach the 'I' from the outside, in a stance of an objective or 'scientific' observer." He then provides two examples of what he will call structuralism. "I can do so in my own awareness when I try to be 'objective' about myself, or try to 'see myself' as others see me." Call this *case A*. Wilber goes on, "and I can also do this with other 'I's' as well, attempting to be scientific in my study of how people experience their 'I.'" Call this *case B*. He then states, "the most famous of these scientific approaches to I-consciousness [cases A and B] have included systems theory and **structuralism**" (boldface is his, bracketed items are mine). So both examples, cases A and B, are meant to describe structuralism.

According to IMP as embedded in ISP, Case A would be categorized as phenomenology rather than structuralism. Notice that viewing *my 'I,'* meaning the individual-interior, *from the outside of me* is not possible in ISP, because by definition, my individual-interior is internal to me as an individual holon, unless data is objectified *and* externalized such that it can be observable to the subject from the external source. Internal to me, however, I *can* view my individual-interior as an object rather than it only being the subject of my awareness. This is the scientific methodology of meditation and phenomenology (not structuralism). Wilber refers to structuralism as the "scientific study of how people experience their 'I's,' which is described as follows (Wilber, 2006):

> The basic research went essentially like this: Pose a series of questions to large groups of people. See if their responses fall into any classes. If so, follow those classes over time and see if they emerge in a sequential order of stages. If so, attempt to determine the structure or makeup of those stages. (p. 53)

Consistent with this description, but more specifically, structuralism in ISP is the study of interior-individual objects as they appear to the external scientist. *Phenomenology* is described by Wilber as "a 1st-person having a 1st-person experience." The experience is indeed first-person to the one having the experience or describing their own experience. When contrasted with his structuralism examples, however, what Wilber is left to mean is an inside (internal) view of the (subjective) interior-individual where the awareness is not made an object (otherwise it would be his case A example of structuralism, which I have already reclassified as phenomenology, when "I try to be 'objective' about myself"). But in this example ("a 1st-person having a 1st-person experience"), awareness is not necessarily made an object by the subject experiencing it. Therefore, it does not qualify as a broad science because it may not be reproducible by an adequately embedded scientist who could perform an injunction that elicits the object in a detached form. The phenomenology class (including meditation, contemplation, and so on) provides procedures for one to attempt to examine individual-interior content internally and scientifically. If you want to witness your thoughts with a certain degree of control, you can perform meditative practices to train your state experiences, for instance. (According to ISP, Wilber's case B example does properly match structuralism in his IMP classification system).

Clear differentiation of the integral lenses in ISP helped me spot or explain the inconsistencies or difficulties in Wilber's IMP examples and in his use of integral mathematics. Wilber's preference for subject to object views without genuine bilateral interaction relates to the Bhaskarian claim that integral theory suffers from the epistemic fallacy as described in the next section.

Epistemic and Ontic Fallacies

Epistemology is the study of knowing and justified belief. The eight subject realms of integral scientific pluralism represent an integral epistemological pluralism and provide eight different aspects of knowing or apprehending by level. Integral ontological pluralism is represented by the eight object realms, which are eight aspects of ontology (the study of the categories of things that exist or may exist in some domain). Lastly, the eight action realms provide an integral methodological pluralism with its eight classes of methodologies (where methodology is the study of methods applied within a discipline). This is one way of using the ISP realms. The fractal quality does not limit ISP realms, however, to placing only the scientist within the subject realms and his object of study in the object realms (recall that the object of study also has a subject view and ISP in its entirety is a new methodological tool).

A dialogue has begun between integral theorists and critical realists especially in the wake of the 2011 Integral Theory and Critical Realism Symposium. Marshall (2012) and Hedlund-de Witt (2012) both claim that integral theory suffers from what Bhaskar, the founder of critical realism, calls the epistemic fallacy. This is an erroneous belief that “statements about being can be reduced to or analyzed in terms of statements about knowledge” (Bhaskar, 1975/2008, p. 36). In defense of integral theory against this argument, Wilber (2013) argued that this improper charge derives from critical realism’s ontic fallacy, or the myth of the given, where ontology is privileged as real and epistemology is then derived from ontology. Hedlund-de Witt (2012), for example, states that critical realism “argues for a world composed of objects (generative mechanisms) existing *independently* of human knowledge, enactment, or discourse.” The implication is that objects exist independently of any non-human rudimentary form of knowing or enacting.

According to Wilber, ontology, methodology, and epistemology are three different, but intertwined aspects of reality and none can be privileged. Given that integral theory is panpyschic (or pan-interiorist, the term Wilber’s prefers), even prior to human conceptions of reality, reality is always co-created by the interiority of holons. The prehending (proto-knowing, proto-feeling, proto-conscious) atom, for example, in some way recognizes other atoms in order to interact with them. There is not a being (ontology) separate from a knowing (epistemology). The lack of privileging subject and object is embedded within integral scientific pluralism and holarchical field theory. Therefore, I side with Wilber on this point. Yet there is a difference I would like to make between Wilber’s integral theory in general, and his common applications as with his use of integral mathematics. Wilber’s use of integral mathematics does privilege the subject’s perspective in its enactment of the object. As described above, there is no analysis of drives emanating from object to subject. There is no causally efficacious effect on the subject from its environment separate from the perspective the subject takes. Holarchical field theory overcomes these problems and is truer to the interrelations of epistemology, methodology, and ontology. This is one reason why it is important to ground perspective taking within a broader array of action between holons within fields.

Conclusion

Holarchical field theory (HFT) was used in this article to clarify some applications of Wilber's integral mathematics, his first formal attempt at analyzing relations among holons. HFT helped to disclose and overcome inconsistencies or reductionisms involving the interior-exterior, internal-external, and subjective-objective dualities. These dualities all become more formally included in ISP and HFT while improving upon the internal consistency of the Wilberian literature. HFT therefore provides a particular response to Edwards' call to question the consistency and logic of a metatheory (2010, p. 81).

The specification of the philosophical/grammatical conflation, where theorists confuse the dual definitions of the subjective-objective duality was particularly useful for constructing, interpreting, and using HFT. This theory opens the realms of integral theory for easier dissections by other dualities, triads, and spectra in the future. In order for a new duality, for example, to be applied generally to HFT, one must cross the ISP realms with the duality and would need to convincingly show how the two poles consistently and logically show up in each of the existing realms. The distinctions should apply to the multiple levels in order for it to be generalizable like HFT. And static and dynamic elements per pole should be specified. Alternatively, one may find it useful to cross a new duality with a subset of the dualities, spectra or triads that currently exist in HFT without generalizing the result as far beyond the given use.

This article contributes to the topic of integral communication (Leonard, 2011) with the distinctions made between state and action language using HFT realms and drives along with the corrected uses of perspectives and pronouns. State language tends to be describing holarchical embeddedness of subjects and objects and action language tends to describe the dynamics in the interacting fields of subjects and objects. Person perspectives and pronouns cannot be reduced to AQAL or HFT realms without qualifications.

Integral scholars and trainers of Wilberian integral theory for integral consulting, integral life practice, and integral psychotherapy may benefit from analysis of themselves, students, clients, patients, or their objects of study as agents embedded in relations with their environment and potential within holarchical fields. Policy analysts using integral political economy and integral ecology, for examples, may also benefit from situating stakeholder groups or ecological units in dynamic exchange using HFT.

Appendix: ISP and HFT Communication as an Instructional Example

In this section, I will use a new, elaborate example to illustrate the realms and drives of HFT as they relate to human interaction and communication. This may help the reader consider the complexity of interaction as described by HFT. This is in comparison to current, but narrow and problematic uses by integral theorists to characterize interaction of holons explained in the body of this article.

Consider my interaction with a colleague who is in another academic department at my college. We each can be analyzed as our own subject at the center of our own Figure 1. As humans, Americans, academics, and coworkers; we share certain, but not all, aspects that are initially internal. Say that we have a conversation and by the end, she and I both understand what she generally means by her excitement for an upcoming holiday break from her grueling semester to enjoy a barbeque gathering. This may imply that I understand her feeling of excitement (a zone 2 object to me since it is an individual interiority that is external to me) under cases in which she is physically worn (a zone 6 object to me because it is an individual exteriority external to me) because of my understanding of excitement (a zone 1 object to me) and because I have been worn or can imagine it to a degree from my experience or internalization of other’s having similar difficulties (a zone 5 object). And I can relate to the systemic pressures that force her to work that hard (a zone 8 object) as I have been in that situation or internalized this issue from observation (zone 7). I also understand the cultural meaning she attaches to sharing a holiday barbeque with her friends (a zone 4 object) as I do too (a zone 3 object).

I understood these objects implying that they are disclosed and enacted into our subjective awareness during our conversation. I may be motivated by a desire to belong in a community with my colleague. This need energizes me to engage the employed drives. Some of the methods used to disclose and enact them have been the use of the English language (a method from zones 7 and 8) intentional thinking, listening, speaking, symbol translation (methods of zones 1 and 2); physical hearing, talking, seeing (methods of zones 5 and 6); and clarifying questions for agreement on definitions or to disclose missing context (methods from zones 3 and 4).

Here, I will track the six general horizontal dynamic drives involved. I exteriorize my thoughts into words effectively because I choose words that allow her to understand my thoughts. Her ideas become internalized into my interior through her creation of vocalized words, which vibrate into my exterior ears. I meanwhile put in the effort to interiorize them into comprehensible thoughts. The collectivization drive was involved in choosing to engage each other. This drive and successfully communicating helped me, especially, to satisfy my belongingness need. My willingness to correct her misunderstanding of one of my comments includes the individuation drive to properly honor my individual perspective and the collectivization drive so that we understand each other.

Since we initially shared (epistemological) skills and employed our methodologies well enough, these objects (ontologies) are understood and can be held in the moment by her and me in our own subjective awareness. There is this overlap in our internal zones of each quadrant such that there is mutual understanding (a zone 3 object for both of us), the content of which relates to all eight ontological zones.

Notice that in this example we clearly differentiate subject, object, and method in each zone. For the analysis of dynamic interactions, the current state of integral theory fosters, at worst, ad hoc and confusing work; or, at best, skillful, but opaque means. The example of this section should help the reader see that there are alternatives to existing attempts to analyze action using Wilberian theory. The inconsistencies and difficulties of relying on AQAL in its current state are examined in the body of this article. These problems often stem from confusion among dualities, perspectives, and pronouns.

Beyond Social Exchange Theory: An Integrative Look at Transcendent Mental Models for Engagement

Latha Poonamallee and Sonia Goltz[1]

Abstract: In this paper, we develop an integrative conceptual framework capturing the underlying mental models that guide engagement in relationships at work and elsewhere. Specifically, we are looking at mental models that go beyond egocentrism and social exchange, which have served as the basis for most frameworks found in research on organizations. The goal of this paper is to present a more complex picture of human cognition and behavior that suggests that egocentrism is not an exclusive motivator. We view this more integrative framework as a set of concentric circles of increasingly inclusive and expansive identities. Although the mental models used by individuals may be static over a shorter time frame, they are thought to be more dynamic over a relatively longer timeframe, in adaptive response to changing conditions. Movement between these mental models can be triggered by changes in cognitions as well as by events that arouse affect.

Keywords: mental models, cognition, positive organizational scholarship, transcendent spirituality

Introduction

Mental models are internal representations of reality held by individuals to guide interactions with external objects or systems (e.g., Jones, Ross, Lynam, Perez, & Leitch, 2011; Rouse & Morris, 1986). This paper conceptualizes an integrative framework outlining the mental models that might underlie various forms of individual and organizational engagement, thereby presenting a more complex picture of human cognition and behavior than has been typical in existing research on behavior in organizations. Drawing on recent research on top-down and bottom-up mechanisms in emotion generation (Oschner, et al., 2009), we also describe the interplay between cognitive and affective processes that shape such mental models.

---

[1] **Latha Poonamallee**, Associate Professor of Organizational Behavior at Michigan Tech, researches and facilitates partnerships, processes and leadership dynamics of social change using critical, post-colonial, and action research perspectives. Her most recent research examines the relationships between micro-level mental models and actions and macro level outcomes.
lcpoonam@mtu.edu
Sonia M. Goltz, Professor of Organizational Behavior at Michigan Tech, has focused on gender equity and organizational justice in her scholarship. Other research interests have included social power and escalation of commitment. Her personal mental model has been influenced in recent years by studying Tibetan Buddhism. Additionally, she is adjusting to a life in the woods off the grid.

SOME RIGHTS RESERVED

The concept of mental models developed in large part in the literature on manual control in terms of psychomotor performance (e.g., Conant & Ashby, 1970) and was later adopted by cognitive psychologists, who conceptualized mental models as descriptions of a system's form, in terms of relationships among components, functioning, and dynamics (e.g., Mathieu et al., 2000). These descriptions are thought to allow individuals to form expectations for what is likely to occur next and decide what actions to take (e.g., Mathieu et al., 2000; Rouse & Morris, 1986). For example, teammates often share agreed upon mental models of important aspects such as the group task and team operations (e.g., Mathieu, Heffner, Goodwin, Salas, & Cannon-Bowers, 2000; Maynard & Gilson, 2013). Similar team mental models allow members to predict what their teammates will need and will be doing, facilitating coordination activities (Mathieu, et al, 2000), which then leads to improved performance (Lim & Klein, 2006).

However, mental models vary in accuracy and development, in part due to the experience of the individual with the system being described by the mental model, which might be too limited to completely portray a complex system (for discussions, see Rousseau, 2001 and Jones et al., 2013). Furthermore, our minds are full of conflicting mental models since we tend to maintain overlapping and inconsistent mental models (Lane, 1992). In part this is because these models are context-dependent and may change depending on the situation (Jones et al., 2011). Also, our mental models can be expected to be fairly resistant to change, given that individuals tend to focus on information that supports existing beliefs (e.g., Swann & Read, 1981). Individual mental models will change when individuals are motivated to more deeply process information that is discrepant with their models rather than stick with the tendency to superficially assess and discount it (e.g., Rousseau, 2001). Still, mental models tend to change slowly rather than suddenly (e.g., Welch Larson, 1994).

An example of a mental model guiding human behavior and interactions that has been slow to change is the assumption that much of human behavior is based on ego-centrism and social exchange. In fact, this model has served as the basis for most theoretical approaches found in research on organizations, given that much of our research on work behavior is based on models of social psychology. These models mostly view social exchange as an economic choice among alternatives in which individuals attempt to maximize their expected utility (Kahan & Rapaport, 1984; Sunahara & Pierce, 1982). Although these mental models have been useful in generating research on human behavior, these efforts may have reached maturity. Assuming human work behavior is primarily egocentric in nature, has the potential for missing behavior that is not egocentric. Atypical behaviors that do not fit neatly into the mental model of egocentricity are not likely to be examined or even noticed.

Therefore, in this paper, we consider mental models that are broader. Drawing on existing literature, we have built an integrative model of engagement, which we view as a set of concentric circles of increasingly inclusive and expansive identities, thereby extending the understanding of human cognition and behavior to include motivations beyond egocentric social exchange. The first or innermost circle is based on ego as one's identity and social exchange theory as the operating mental model for human interaction. In the second circle, we look at a mental model based on a group or tribal identity that shares interests, passions, and affective bonds including organizations, industries, and even virtual groups. The key feature of this circle is the suspension of the usual social exchange norms and extension of benevolence to those who are part of the group. The third circle describes a transcendent mental model that involves moving from a primary concern for the tribe and temporary prosocial behaviors directed at outsiders to experiencing enduring changes in an individual's concern about others' welfare leading to a sense of oneness and a merging of self-other boundaries.

Specifically, this paper makes two contributions. First, by using the top-down and bottom-up approach to emotions, it broadens the scope of mental models to include the role of the 'affective' component in a mental model and describes the interplay between cognitive and affective processes that underlie a mental model. Second, by describing the mental models underlying the three circles and the mechanisms of movement between them, this paper illuminates how more expansive mental models can produce a more complex cognitive response to phenomena. By doing this, it also offers the beginnings of a blueprint for how to shift mental models at a collective level. It should be noted that, although researchers have worked on multi-level research (e.g., Rousseau, 1985), they have not explicated the mental models that individuals and organizations operate from in their interactions with each of these levels. For example, often individuals and organizations are completely unaware of and indifferent to factors at larger levels, such as social structures, that are affecting them, instead operating from a very local point of view. Their lack of awareness of and indifference to factors operating at larger and more complex levels negatively impacts their ability to solve problems directly affecting them.

We begin with a brief review of the literature on mental models. We also describe the key elements that go into the making of mental models and the relationship between the various elements. We then describe and discuss our integrative model for engagement and its three circles in detail and speculate how the various mental models may interact with each other.

Making of Mental Models

The key elements that we believe contribute to mental models of appropriate social behavior are cognitive framing (particularly social identity) and affective arousal. We have identified the two processes based on recent brain research (Ochsner, et al., 2009) that suggests that emotions can be generated through either cognitive constructions and interpretation that lead to emotions or through the experience of immediate affect which then can leads to cognitions. Poonamallee (2012) uses this framework to describe the role of socio-ecological values and the interplay between cognitive framing, and affective arousal elements in the rousing of compassion to strangers during disasters. In this paper, the author demonstrates how in the case of the Asian Tsunami, cognitive framing of the society and the affected populations as well as the emotional valence and portrayal of the disaster stories by the mass media (and by proxy, the society itself) influenced the construction of a collective identity, thus rousing compassion towards strangers.

We conceive of mental models as being generated either cognitively through top-down processing or affectively through bottom-up processing or through complex interactions between both systems. The particular triggers that affect which process occurs will be considered later. At this point, however, we simply wish to introduce the top-down and bottom-up components. Research suggests that individuals' interactions with others are affected by both cognitions and affect. For example, although some scholars view social identity as purely cognition based (e.g., Ashforth & Mael, 1989), others have defined social identity as a part of self-concept derived from both the knowledge of group membership as well as the emotional significance of that membership (e.g., Tajfel, 2010). Furthermore, research indicates that affect can be more predictive of group behavior than cognitions. Van Zomeren et al. (2008) found that affective injustice had stronger effects on collective action than non-affective injustice. It is thought that group-based affect helps link group cognitions to group action (e.g., Van Zomeron et al., 2008; Yzerbyt, Dumont, Wigboldus, & Gordijn, 2003). Therefore, it is likely that mental models that are shared by a group, such as those concerning collective action, have both cognitive and affective components, with group affect sometimes influencing group cognitions and vice versa. For this reason, we expect that even group-based mental models that are influenced heavily by cognitions such as social identity can be strongly influenced by affective variables as well.

Top-down Mechanism: Cognitive Framing

We begin our discussion by considering the cognitive framing aspect of mental models. Although most mental models are probably fairly developed (although perhaps incomplete) representations of systems that allow one to interact appropriately with those systems, most probably took their initial forms with a basic view point, or frame, that served as a guideline for the construction of the mental model. Frames are cognitive structures that focus, articulate, and transform, which operate at both the individual and group levels (Snow, 2007). Frames are essentially central organizing ideas that can steer an audience by providing particular meanings, thus operating as interpretive mechanisms (Gamson & Modigliani, 1987). They are influenced by reference points and carry this information (McKenzie & Nelson, 2003). Campbell (2006) describes frames as: "*metaphors, symbols, and cognitive cues that cast issues in a particular light and suggest possible ways to respond to these issues. Framing involves the strategic creation and manipulation of shared understandings and interpretations of the world, its problems, and viable courses of action*" (Campbell, 2006, p. 48-49). Although some literature on framing includes the affective aspect, in this paper, we use Campbell's definition of framing as a cognitive mechanism to distinguish it from the process of affective arousal.

Understanding the effect of framing has been useful in a variety of literatures. For example, framing perspectives in the social movement's literature emerged in response to the void in exploring the relevance of interpretive processes for mobilization (Snow, 2007). It is also used by disaster researchers (Argothy, 2003; Cottle, 2006; Hoijer, 2004; Rodriquez, Trainor & Quarantelli, 2006; Tierney, Bevc & Kuligowski, 2006). In this literature, frames are thought to both empower and limit reality and have the power to provide edited or fragmented versions of reality (Argothy, 2003). Framing has also been examined in organization studies and management, such as with positive and negative framing in decision-making contexts (e.g., MacKenzie & Nelson, 2003) and in discussions of sense-making (Weick, 1995) and sensegiving (Gioia & Chittipedi, 1991; Maitlis, 2005) processes. Additionally, decision framing has been applied to understand effects such as individual judgments about organizational justice. Positive frames, for example, are thought to reduce the need for sense-making of outcomes received, thereby reducing the importance of procedural justice (Brockner, Wisenfeld, & Martin, 1995). Additionally, it has been found that individuals make sense of procedural justice differently depending on whether they identify strongly or weakly with a particular group (Tyler, 1999).

A frame of particular importance to mental models for interaction and engagement is social identity. Framing processes play a critical role in the development and maintenance of individual and collective identities (Hunt, Benford, & Snow, 1994). Social identity is that part of self-concept that is defined by membership within a group (Tajfel, 2010). People classify themselves and others into social categories, in part to be able to define and order the social environment and in part, to locate and define themselves Ashforth & Mael, 1989; Turner, 2010). People seek to maintain a positive social identity to boost self-esteem, such as by making comparisons with out-group members (Tajfel & Turner, 1986). Social identity theory has helped explain in-group bias and out-group stereotyping among other group behaviors (Brown, 2000). But these identities can affect individual framing and behaviors as well. Identifying with a group leads to individual behaviors supporting the group's behaviors and its values and norms (Ashforth & Mael, 1989). For example, through perceptions of group-based deprivation, social identity can help mobilize people for collective action that benefits group members, which is unlikely to occur through egoistic (individual-based) deprivation (Drury & Reicher, 1999; Van Zomeren, Postmes, & Spears, 2008). On the other hand, since social identity also can also lead to major social conflicts between in-group and out-group members, it has been suggested that policies that redirect people to have more overlapping and inclusive identities are needed (Brown, 2000).

Bottom-up Mechanism: Affective Arousal

The second major element thought to affect the construction of mental models is affective in nature. The heart of emotion has also sometimes been called core affect, which refers to a primitive, universal and irreducible subjective experience consisting of both a pleasure-displeasure dimension and an arousal dimension (Russell, 2003). Emotions help guide goal-directed human behavior, allowing people to adjust to environmental changes because they signal when an important goal is threatened and needs attention (Kaufman, 1999). Among other things, emotional arousal is a key element that guides people's engagement with others, thanks in part to evolutionary processes, which helped create a central nervous system that responds to the complex social world of primates via emotional processes such as empathy (Brothers, 1990; Preston & de Waal, 2002). Empathy and trust, two essential elements in positive human interaction and interpersonal cooperation, consist of both affective and cognitive components (Brems, 1989; Duan Hill, 1996; McAllister, 1995). They are associated with a release in oxytocin (Barraza & Zak, 2009; Baumgartner, Heinrichs, Vonlanthen, Fischbacher, & Fehr, 2008), a hormone synthesized in the hypothalamus and released to areas associated with emotions and social behaviors.

One particular factor that can stimulate empathic emotions, an important component in the present analysis, is the presence of others who are in need or suffering in some way. Psychologists have noted that emotions can serve as two different types of motivators when others are in need or suffering: individuals can be motivated to reduce their own distress from viewing the distress of others or they can be focused on relieving the stress of others (Batson, 1991; Batson & Oleson, 1991). Empathy and distress appear to work against each other physiologically (Barraza & Zak, 2009) and research indicates that personal distress and prosocial behavior are negatively correlated whereas empathy and prosocial behavior are positively correlated (Batson, 1998; Eisenberg & Fabes, 1998). However, the relationship between empathy and prosocial behavior has been moderate, indicating that there are several dispositional and situational moderators of the relationship (Eisenberg & Miller, 1987; Eisenberg, 2000). Consistent with this, it has been found that individual responses to others who are in need are also based on the appraisal of the others' relevance to their own salient goals and values, their own self-definition, and the extent to which the others are seen as deserving of assistance base on these beliefs. For example, Goetz, Keltner, and Simon-Thomas (2010) reported that an actor's compassion is aroused by the degree to which his or her own values and beliefs about the constitution of good character, positive meaning, human worth and humanitarian ideals are perceived as consistent with and/or signaled by the sufferer's characteristics, situation, and/or social make-up.

Top-down and Bottom-up Processing

We have based our conception of how mental models for human interactions are developed on brain research into emotions. Brain research indicates that emotions can be generated through either cognitive constructions and interpretation that lead to emotions or through the experience of immediate affect which then can lead to cognitions (Ochsner, et al., 2009). The former type of generation has been called top-down and triggers interactions between the prefrontal cortex areas involving working memory and information retrieval and the left amygdala (Ochsner et al., 2009). [The amygdalae have been found to be involved in responses to emotionally salient stimuli (Ledoux, 2000; Phelps, 2006).] The latter type has been called bottom-up and stimulates both the right and left amygdalae as well as the occipital, prefrontal, and parietal parts of the brain which are implicated in attentional processes and encoding into memory (Ochsner et al., 2009). Thus, top-down and bottom-up processes use distinct cortical networks (Ochsner et al., 2009). However, both types of processing are likely to be active in many situations (Ochsner et al., 2009). Top-down processing is thought to be semantic in nature, involving cognitive complexity that plays a role in emotional regulation whereas bottom-up processing is thought to be important for attention shifting in terms of detection of changes in the environment and potential threats (Ochsner et al., 2009). This is similar to the processes that Kahneman (2011) terms Systems 1 and 2 in the mind. System 1 operates on automaticity without any sense of voluntary control and System 2 involves effortful mental activities.

Bottom-up processing is more sensitive to changes in the environment than top-down processing, and top-down processing helps produce more long-term behavioral repertoires that are effective, but that can also be less sensitive to environmental changes, at least initially. Note for example, that much of human behavior is maintained by if-then rules describing contingencies rather than by the actual contingencies themselves since consequences for behavior are often delayed (see, for example, Malott, Shimamune, & Malott,1992; Weatherly & Malott, 2008). However, the rules individuals follow can lead them to be insensitive to the actual contingencies operating in the organization, producing dysfunctional behavior (e.g., Hayes, Strosahl, & Wilson, 1999). In fact, it has been suggested that top-down and bottom-up processing have implications for how to change dysfunctional behavior, with behaviors being generated by top-down processes being more responsive to cognitive methods that restructure interpretations of the situation and behaviors originating bottom-up being more responsive to behavioral reinforcement methods that reshape responses through desired and aversive stimuli (Ochsner & Gross, 2005; Ochsner et al., 2009; Quirk & Beer, 2006).

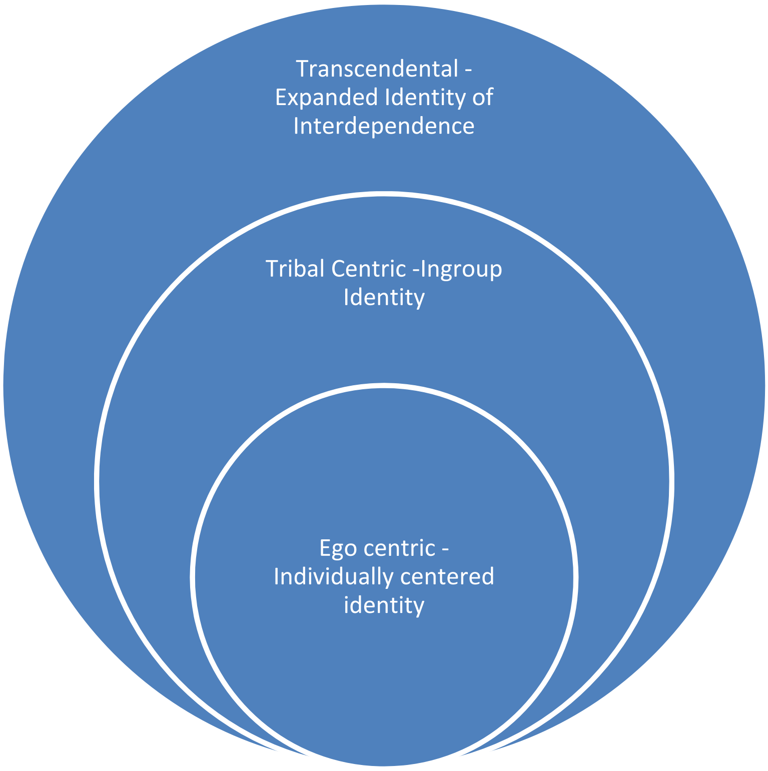
Considering that both top-down and bottom-up processing contribute to mental models used in human social interactions can help us reconcile what seem to be opposing theoretical viewpoints of behavior. For example, altruistic behavior has been conceptualized in a variety of ways by researchers. Hirschleifer (1983) takes an economic approach to post-disaster cooperative behaviors and describes a theory of post-disaster altruistic behavior as consistent with enlightened self-interest. This would be consistent with a top-down cognitively generated mental model of appropriate social behavior. However, it has also been suggested that prosocial behaviors may be triggered due to personal distress because people can see themselves as potential sufferers (Eisenberg & Miller, 1987). This conceptual approach appears to describe a bottom-up affectively constructed mental model. More than likely, each theoretical approach accurately, but only partially, accounts for prosocial and altruistic behavior, and there are likely even other explanations of this behavior not yet elucidated that involved complex, reciprocal processing between cognitive and affective brain structures.

Following, we present the three circles found in the integrative framework.

The Integrative Framework

In our view, this framework has the potential for a multitude of applications in various social settings. For purposes of illustration however, we will focus on two management research areas that we believe could particularly benefit from the integrative framework, organizational justice and corporate social responsibility (CSR). Organizational actions in these two realms reflect underlying collective mental models about engagement and responsibility. CSR should concern multiple stakeholder groups beyond the immediate employees, including global organizational and inter-organizational initiatives with groups of people who may not directly interact otherwise, which falls in the circle three of our integrative model. However, organizations that have historically been concerned more with circle one and two themes may find CSR outside of these circles difficult. Similarly, the organizational justice literature usually has been concerned mostly with justice within an organization, falling squarely in circles one and two of our framework. However, there have been calls to extend the concept of organizational justice to stakeholders outside the organization, which the framework could help accomplish.

We conceive of the integrative framework as consisting of concentric circles of successively expanding identities that serve as the basis for mental models for engagement (see Figure 1). These circles are constructed with three dimensions: awareness of time-orientation, scope of impact, and directionality of relationships (see Table 1). We believe that movement between these circles occurs and depends to a large extent on the complex interplay of cognitions and emotions. We will discuss this more with respect to each circle in our framework. We will also speculate on the interactions between the mental models underlying the three circles.



Transcendental - Expanded Identity of Interdependence
Tribal Centric -Ingroup Identity
Ego centric - Individually centered identity

Figure 1: Beyond Social Exchange Theory: Integrative Framework

Table 1: Awareness Dimensions

Circle/Dimension	Time Orientation	Scope of Impact	Directionality of Relationships
First Circle	Short-term	Self/Ego	Simple, One way: Me Vs the world
Second Circle	Short-term and Medium-term	Self and immediate and related others	Restricted two-way: Us Vs the world
Third Circle	Long term	Self, immediate/related others, and distant strangers/universe	Complex, inter-connected: Me in the world

First Circle: “Ego-centric”

Much of research on work behavior has been rooted in models of social psychology, many of which have been based on economic conceptualizations of choice. Economic conceptualizations often assume that individuals are motivated to pursue their own ends in a way that minimizes costs and maximizes profits, which has been called "instrumental rationality" (Weber, 1978). Human interactions are viewed as a set of exchanges with rewards and costs and individuals are thought to decide whom to interact with based on expectations of these rewards and costs (Kahan & Rapoport, 1984).

This circle can be viewed as being parallel to the first of the neo-Kohlbergian major stages of moral reasoning, in which the "personal interests schema" is used (Narvaez, 2005). In this type of thinking, a person uses the filter of how does this affect my personal interest, with no socio-centric perspective involved. Cooperation with others is at the very micro level of thinking, with personal advantage being seen as a virtue (Narvaez, 2005). We can see this emphasis on ego-centric social exchange in models of various work and organizational behavior, such as motivation, organizational justice, power, and psychological contracts. For example, the expectancy (e.g., Porter & Lawler, 1968; Vroom, 1964) and equity (e.g., Garland, 1973; Vecchio, 1981) theories of motivation are directly based on the instrumental rationality model found in economics. Similarly, most conceptualizations of organizational justice (e.g., Fortin & Fellenz, 2008), are based on social exchange concepts derived from economic principles (e.g.Homans, 1974; Thibaut & Kelly, 1959). So are most of the understandings about power (for a discussion see Goltz, 2011). Yet another example is the idea of psychological contracts (Rousseau, 1989), which in turn is viewed as central to the concept of organizational justice Cropanzano & Prehar, 2001).

Certainly, the explanation of human work behavior as primarily being driven by ego concerns appears to be supported by empirical studies. For example, the literature is replete with data indicating that individuals treat the concept of fairness differently depending upon whether it is directed toward others or toward themselves. Individuals overestimate their own performance (Lichtenstein & Fischhoff, 1977; Fischhoff, Slovic, & Lichtenstein, 1977), tend to attribute success to themselves and factors under their control and failures to external factors (e.g., see Mezulis, Abramson, Hyde, & Hankin, 2004 for a review), and tend to put less effort into creating equity after being overcompensated than after being undercompensated (see Campbell & Pritchard, 1976 and Greenberg, 1982 for reviews). Also, studies on power indicate that as power increases, power holders generally view others as little more than tools (Gruenfeld, Inesi, Magee, & Galinsky, 2008) and are not as concerned with how others experience the world (Galinsky, Magee, Inesi, & Gruenfeld, 2006).

On the other hand, it is also well known that studies using purely economic principles to make predictions about social behavior often have fallen short (for reviews, see Goeree & Holt, 2001; Kagel & Roth, 1995). For example, fair offers rather than self-interested ones are common in the ultimatum game (for recent discussions, see Chiang, 2008; Zollman, 2008). Additionally, the tendency of management researchers to take either an economic rationality approach to business or a humanistic one that focuses on emotions has been criticized for ignoring the spiritual aspects of existence (Gozdz, 2000). Similarly, the focus on instrumentality in descriptions of social power has been criticized for ignoring bases of power that stimulate transcendent responses based on the idea of connectedness with others (Goltz, 2011).

Furthermore, ego-centric based behavior can be ultimately self-limiting and it is precisely these atypical responses that may help resolve some of the current issues in organizations in the two management areas to which we apply out model in this paper. For example, in the area of organizational justice, Goltz (2010) found women who believed, despite their failed individual discrimination cases, that in the long run, individual attempts at change are important because many individual attempts will add up, resulting in slow, evolutionary change, and that it is one's responsibility to be part of this process. Similarly, in the area of corporate social responsibility and sustainability, Baets and Oldenboom (2010) suggest that individuals who act out of a consciousness of connectedness are more likely to be able to build sustainable organizations in part because they are more able to adapt to the complexity that exists in the world than are individuals who think more linearly. This ties back to the dimensions we have listed in Table 1. A mental model based on Circle 1 takes a short-term, narrow approach thus limiting understanding of relationships to a Me Vs Them viewpoint, which misses the complexity of the larger world.

Emotions signal when an important goal is threatened and since individual survival is one of those goals, we can certainly see bottom-up processing as frequently playing an important role in the development and application of an ego-centric mental model. Thus, regardless of which mental model they might normally use, we would expect individuals to operate egocentrically and justifiably so, when feeling fear from threats to individual survival, whether emotional or physical survival is threatened. (Note that this ability to move adaptively from one mental model to another depending on the situation distinguishes our framework from models of moral development in which individuals are thought to shift permanently.) However, individuals may also develop an egocentric mental model via more top-down processes. For example, individuals may reflect on past experience, present circumstances, and future goals and then make a conscious choice of a more egocentric strategy because it is seen as being effective for meeting their goals.

Second Circle: Tribal-Identity- centric

As discussed in the section on social identity, egocentric behavior can be replaced with behavior supporting the values and behaviors of a social group when the antecedents of social identity have occurred. We use the term ‘tribal’ to signify such forms of social identity. The word ‘tribe’ is borrowed from anthropology used to describe archaic societies that maintain social order through affective and non-rational bonds (Cova & Cova, 2002). This word still resonates in modern and post-modern societies and is used to signify any group that shares interests, passions, and affective bonds including organizations, industries, professional groups and even cyber tribes (Poster, 1998). Unlike the traditional tribes that were bound by kinship and dialect, post-modern tribes are connected through shared feelings and symbols (Cova & Cova, 2002). Organizational identification one such specific form of social identification (Ashforth & Mael, 1989) and fall in this circle.

Current research on positive emotions (Frederickson, 2001; Kanov, et al., 2002; Lillus, et al, 2008) and prosocial behaviors in the fields of management and organizational behavior (Grant & Francesca, 2010) has given us an insight into a mental model that operates in workplaces which foster a shared identity of compassionate and positive organizations. These studies (Kanov, et al., 2002; Lillius, et al., 2008) reveal the process by which individuals engage in compassionate acts within workplaces and how organizations can foster a compassionate culture that in turn legitimizes individual acts of compassion. These organizations encourage proactive social behaviors through a set of values, practices, and routines (Kanov, et al., 2002). For example, Grant’s (2008) study looks at the role of relational job design that encourages and rewards prosocial behavior. This stream of research spans a spectrum from forgiveness (Bright, Fry, & Cooperrider, 2006), compassion (Kanov, et al., 2002; Lillius, et al., 2008), emotional resilience

(Powley, 2009), to virtues (Cameron & Caza, 2002). For an exhaustive review on this stream of research, please refer to Donaldson and Ko (2010).

To some extent, this circle parallels the *maintaining norms schema* found in the neo-Kohlbergian tradition of moral development. In this phase in the neo-Kohlbergian model, individuals have the awareness that people relate to each other through institutions and established practices and upholding social order is therefore viewed as being very important (Narvaez, 2005). For example, religious authoritarianism has been found to be related to this type of reasoning (Narvaez, 2005). However, in our framework, it is not the upholding of the norms and traditions that is so important, but rather the maintenance of connection to tribal identity that is key. It certainly is the case that upholding social norms is a way to maintain one’s connection to tribal identity; thus, we see these frameworks as being conceptually parallel. However, we wish to emphasize here that we believe that the motivation to uphold social norms arises from tribal identity rather than the reverse.

In this circle, the sense of tribal identity, i.e. a sense of belongingness to a group, organization, team, family, or a local community, is fostered through regular interaction, which in turn fosters positive sentiment (Homans, 1974). For example, attachments that govern even economic behaviors embedded within networks of social relationships (e.g., Granovetter, 1985; Larson, 1992) are thought to be a critical factor in these interactions (Seabright, Leventhal, & Fishman, 1992). Pressure for continuing these economic interactions often will occur even when the exchanges obtained from the relationships are no longer economically rational (Seabright, et al., 1992). Economic behavior based on emotional attachments rather than rational calculations would be an example of more bottom-up, emotional processing of the tribal mental model rather than top-down cognitive processing.

This form of identity is more inclusive than the egocentric one of the first circle. The tribal-centric mental model has an evolutionary basis in that individuals operating with this model have better survival chances than individuals operating alone. Analyses by anthropological archaeologists indicate that groups tend to develop when habitats become poorer or unstable and competition for resources increases such as due to overpopulation because groups can provide individuals with differential access to resources (e.g., Kennett, Winterholder, Bartruff, & Erlandson, 2009). Also, there is a propensity to be most loyal to one’s own kin, known in evolutionary biology as Hamilton’s Rule, which specifies the level of altruistic behavior among kin that maximizes the survival of one’s genes (e.g., see Bergstrom, 1995). However, because the notion of benevolence is extended only to those who are part of the network, it is still restricted because of the dependency on the dynamic of interpersonal relationships within the context of a group organization. Also, the other side of a tribal-identity centric mental model maybe parochialism and a lack of inclusiveness. It may inadvertently lead to the sometimes toxic dynamic of in-groups and out-groups, such as through discrimination, bullying, shunning, and other behaviors. This may occur at a level that is difficult to detect but in a form that has great impact over time. Certainly, the research on discrimination, for example, indicates that individuals have unconscious biases towards minorities that can result in an accumulation of disadvantages over time (e.g., Agars, 2004; Fiske, 2002).

Further, just as how behaviors based on the ego-centric mental model can be self-limiting, in this case, a focus on the tribe can lead to a sort of prisoners' dilemma effect in that resources gained for the tribe at the expense of outsiders can ultimately have negative effects on all, both tribe members and non-members. This is illustrated by research that indicates that countries with social heterogeneity and large inequities, such as in the form of income inequality and economic discrimination among groups, have lower trust levels between economic agents and lower economic growth, creating a poverty trap (Zak & Knack, 2001). Therefore, while a tribal-centric view may be meaningful and productive in the short and medium term, its narrow awareness of scope of impact and related limited relational directionality which gets manifested as 'Us Vs Them' mentality is likely to be problematic in the long term, especially in complex situations and problems.

Although, as discussed, much of tribal behavior may result from emotional attachments or be genetically programmed as a result of evolution, when there is more of a choice, a cognitive, top-down processing could certainly lead to a mental model that belonging to a tribe may be more effective for survival than not belonging.

Third Circle: Interdependence-centric

Much of existing research on prosocial behavior that goes beyond the social exchange theory driven models is done on the second circle by the positive organizational researchers. However, much of this research is based on the assumptions of immediacy, proximity, interaction and a relational or caring ethic. In the third and final circle, we describe a transcendent mental model that is predicated upon the most expansive understanding of interconnectedness of all sentient beings in the web of life. In this circle, people have moved from situationally motivated prosocial or moral behavior to more enduring concern about others' welfare (Batson, et al. 1995) leading to a sense of oneness and a merging of self-other boundaries (Cialdini, et al. 1997). For such helping behavior based on a transcendent mental model, one needs to be objectively self-aware (Carson & Miller, 1987), possess emotionality (i.e. the tendency to experience emotions), and have a highly developed set of emotional regulatory processes (Eisenberg, 2000). This is in line with Oschner, et al.'s (2005) conclusion that cognitive capacities and emotional capacities go together.

We find two extremely different and seemingly opposed frameworks as helpful anchors for this circle: one based on an abstract and rational idea of humanity grounded in the enlightenment tradition of entitlement and rights, and the other grounded in spiritual and religious traditions of moral responsibility towards fellow creatures.

According to the first framework, this mental model is based a moral sensibility or concern for remote strangers from different continents, cultures, and societies (Hoijer, 2004) based on an abstract and rational idea of humanity (Sznaider, 1998) arising from democratization. It is a rights-based approach related to personal responsibility. Therefore, this model tends to distinguish between those who may be called 'deserving' and 'undeserving' of compassion. This is echoed in Skitka's (1999) finding that both liberals and conservatives were generally equally likely to ascribe more personal responsibility and blame to both communities and individuals that did not take adequate flood precautions than those that did while seeking federal disaster assistance. Lerner and Simmons (1966) present evidence for the argument that whether observer reactions to the innocent victim take the form of compassion or rejection depend on the observer's need to believe in a just world and the belief that there is an appropriate fit between effort and outcome.

The second approach to such benevolence is grounded in spiritual and religious traditions. Haidt and Graham (2006) argue that community, authority, and the sacred are the sources of moral values across people and cultures. Both Eastern and Judeo Christian traditions have emphasized the role of compassion in salvation or wisdom. Sznaider (1998) describes the Christian principle of 'love thy neighbor' as a manifestation of God's *agape,* a spontaneous, unconditional and unmotivated by the value of the one who is loved. Similarly, according to Buddhism, compassion exists when one has the wisdom to see all sentient beings are very much interdependent, and therefore, the question of worthiness is not part of the picture in this approach. Compassion in this tradition flowers out of the assumption that we are all connected in the tapestry of life by our own human spirituality and connectedness to the planet as a whole (Long, 1997). It is a set of deeply held values and beliefs that guide a particular community or society in their relationship with nature as a whole, which includes other human beings **(**Poonamallee, 2011a). In this model, compassion and wisdom go together because one operates from an understanding that all sentient beings are interconnected and operate as one and focuses on the ideal of unity.

Both the enlightenment and spiritual traditions that can serve to anchor behavior in this third circle would require a person to use a *postconventional schema*, in the words of the neo-Kohlbergian tradition of moral development (Narvaez, 2005). In this type of reasoning, social conventions are not inviolate; instead, principles and values are key. Moral obligations are based on sharable ideals rather than ethnocentric preference (Narvaez, 2005). This approach requires more cognitively complex thinking, which provides more flexibility. This flexibility in thinking comes from a greater exposure to various situations: research indicates that the more education and the richer one's social experience, including multi-cultural experience, the greater the development of postconventional thought (Narvaez, 2005). For example, in Kohlberg's (1969, 1971) postconventional phase, individuals recognize that compromises are sometimes needed because notions of what is just can differ since the distribution of resources and rewards can be based on a number of criteria, such as self-interest, physical characteristics, need, relationship ties, and behavior or productivity (e.g., Thomson & Jones, 2005). Therefore, post-conventional thinking is based on open scrutiny and debate (Narvaez, 2005).

This paper does not argue for either the humanistic or spiritual approach. But drawing on both frameworks, we argue that collectively held beliefs and values of any social group– be they grounded in traditions of spirituality or in enlightenment – have an impact on creating and sustaining a transcendent mental model for human interaction. In fact, there is sufficient evidence both faith and spirituality based groups and non-spiritually or religiously inclined radical rational humanist societies operate based on this transcendent mental model. Scandinavian and western European countries, among the least religious wealthy countries, are also most likely to contribute very generously to foreign nations. For example, the Norwegian government has the distinction of the highest per capita contribution to foreign aid (104 cents per person) but is also among the least religious wealthy nations.[2] Similarly, Sweden and Denmark also rank among high contributors of foreign aid while falling among the least religious nations.[3] Citizens of these countries also contribute towards providing a high quality of life for their own citizenry in terms of universal healthcare, education, environmentally friendly transportation etc. Common to both traditions is the transcendent mental model that suspends social exchange theory on a long-term basis.

Movement between the Circles

One of the primary ways in which our framework is different from Kohlberg's discussion of moral development (1969, 1971) is that in our view, movement between mental models is neither unidirectional nor does it arise solely from moral development. It is possible to move between circles triggered by either top-down/cognitive processes and/or bottom-up affective processes. To illustrate the various possibilities in terms of movement between the three circles, we constructed Table 2, which includes examples of movement that could be driven by top-down or bottom-up processing.

Table 2: Examples of Transition Types from Circle to Circle

Direction of Movement	**Top-down Processing**	**Bottom-Up Processing**
Outward	Organizational socialization into a compassionate culture (Circle 1 to 2) Regular meditation practice (Circle 2 to 3)	Pro-social behavior in terms of empathetic response to co-workers (Circle 1 to 2) Pro-social behavior in terms of empathetic response to strangers in crisis (Circle 2 to 3)
Inward	Protective response to ongoing survival pressures, e.g., immigration, competition (Circle 3 to 2 or 2 to 1)	Experience of sudden serious threats to own basic needs (Circle 3 or 2 to 1)

We have termed movement from a less inclusive to more inclusive circle 'outward movement' and the movement from an outer to an inner circle, 'inward movement'. Generally speaking, we view outward movement, in which the focus is beyond the ego concerns or even the tribe, to signal growth in an individual's, group's, or organization's mental model development. This is because the more expansive mental models represent more cognitively complex thinking, such as by taking into account how beings are interconnected and how they impact each other in complex ways. Thus, egoistic and tribal concerns are allowed for in the third circle, but they are put in their proper places. However, it should be noted that moving to a more self-focused mental model that excludes more expansive thinking may sometimes be called for in the situation and it is not necessarily the case that a narrowing focus represents regression.

[3] http://www.gallup.com/poll/142727/religiosity-highest-world-poorest-nations.aspx

There are instances when an egoistic focus is needed for self-protection or growth, for example, that then can allow for a later more permanent movement to a more expansive mental model.

Recall that research indicates that mental models are fairly resistant to change (e.g., Swann & Read, 1981), change primarily when individuals are motivated to more deeply process information that is discrepant with their models (e.g., Rousseau, 2001), and even then, usually change slowly (e.g., Welch Larson, 1994). Therefore, for movement to occur between circles and for mental models to change more permanently, we believe that some time must elapse during which cognitive restructuring is occurring in response to changing conditions. This could be exposure to different cultures, for example, as suggested by the research that indicates more cultural exposure is associated with more post-conventional thinking (Endicott, Bock, & Narvaez, 2003). However, it is also possible that bottom-up emotional processing will trigger movement between circles to broader inclusivity. In these cases, we expect the movement to be more immediate and short-term in nature and movement back to earlier, less inclusive, mental models will be likely at some point unless sufficient top-down processing occurs as well. For example, movement between the second and third circles may occur in response to the suffering of strangers during a disaster. But this can be transient if the response was driven solely bottom up or affectively driven without an accompanying top down cognitive reconstruction. This is equally applicable to any change in external stimuli. If organizations want to move beyond ego and social identity centric behavior, such as when trying to generate inclusiveness in the organization, they can use more affect-generating practices (e.g., how would you feel in this situation of discrimination), but these might be short-term in effectiveness. Cognitive practices that focus on oneness and interdependence might be more long-term. For example, the effect of an emotionally charged training program to change attitudes and behaviors may dissipate over time without sufficient cognitive restructuring to make it longer lasting.

Outward Movement

Outward movement is possible based on positive cognitive framing or emotional arousal. Top-down processing that leads to outward movement is more likely to take place over a longer period of time than bottom-up process that leads to outward movement and the effects are likely to be more permanent in nature. An example of movement from Circle 1 to 2 is the socialization of new members into organizational culture. A newcomer enters an organization on the basis of an individual employment and psychological contract with the employer, i.e. Circle 1 and moves towards Circe 2 through socialization. Organizations achieve this through a top-down mechanisms of clarification of roles and relationships (e.g., see Bauer, Bodner, Erdogan, Truxillo, & Tucker, 2007). This adoption by the newcomer of the mental model used by the organization may represent a movement from a more ego-centric mental model to a tribal one (first circle to second circle) and engender organizational citizenship behaviors thus moving the employee from an ego-driven individualistic identity to one of organizational identification.

An example of a top-down cognitive restructuring mechanism moving from Circle 2 to Circle 3 is regular meditation practice. The research literature on meditation suggests it stimulates movement from a circle two mental model to a circle three mental model, since its effects include non-judgmental acceptance, compassion, and an increased sense of connectedness with others (for a review, see Goltz, 2011). Meditative practices increase calmness and wellbeing

(Friedman & Coates, 2000) and result in an ability to respond non-habitually (Wenk-Sormaz, 2005). In addition, the wisdom and spiritual-based reasoning that can arise from practices such as meditation emphasizes more collective and universal concerns, transcending concerns about self (e.g., Achenbach & Orwoll, 1991; Dehler & Welsh, 1994; Orwoll & Perlmutter, 1990; Pascual-Leone, 1990).

Outward movement can occur from bottom-up, affective processing as well. Disaster research as well as research on compassion towards strangers indicates that social exchange norms are suspended or relaxed during breaching moments such as large-scale natural disasters, and compassion and empathy is directed towards those with whom one does not share organizational or social identification and who might not be able to reciprocate the help (e.g., Comfort, 2006; Haidt & Graham, 2006; Hoijer, 2004; Nussbaum, 2001; Poonamallee 2012; Viscusi & Zekhauser, 2006; Weine, et al, 2002). For example, altruistic and prosocial behaviors in disaster contexts take the form of volunteerism (Taylor, 1970), donations (Argothy, 2003), provision of emergency medical services to the victims (Quarantelli, 1983), search and rescue (Durkin, 1987), and sharing of knowledge and expertise to develop community psychosocial and civic infrastructure (Weine, et al. 2002). Prosocial behaviors are thought to be triggered due to personal distress (Eisenberg & Miller, 1987) since people can see themselves as potential sufferers at some point, which can lead to an emotional arousal that moves them beyond both the first and second circles to the third one. However, this expansion of identity may not be sustained over periods of calm unless there is a cognitive reframing of some sort. The good news is that this behavior can be generated through top-down processes as well. For example, Douty's (1972) economic approach to post-disaster cooperative behaviors as consistent with enlightened self-interest is more cognitively based. So is Dynes' (1994) description of situational altruism, which emerges when the new victims' needs cannot be met by existing institutional resources. Prosocial behavior based on a more permanent third circle mental model is needed in an era of ecological overshoot that will depend on compassion and kindness, not only during disasters but continually (Cairns, Jr., 2005).

Inward Movement

As we have indicated, we expect that inward movement generally does not represent growth in cognitively complex thinking and so, outward movement is more desirable than inward movement. However, inward movement is expected to occur at times and these occurrences are likely to fall into one of two categories. First, as discussed, an increased focus on self or tribe to the exclusion of others outside those circles is likely to happen when the more inclusive mental model was achieved through bottom-up, rather than top-down processing. For example, after the worst of the disaster appears to be over, the mental model of helping strangers, even natural enemies that was stimulated through emotional arousal recedes into the background, and the tribal-centric model re-emerges.

Second, we expect that inward movement will commonly happen when the self or tribe is threatened in some ways in terms of the ability to meet basic needs. This threat could be processed either cognitively or emotionally. A sudden threat is likely to be processed affectively bottom-up and longer term, a slowly emerging threat is likely to be processed top-down. If the threat is sudden and emotionally processed, it is possible that upward movement to the previous mental model will occur once the threat has been handled. If the threat has been more long term in nature, stimulating cognitive processing, then a return to the earlier, more inclusive mental model is unlikely unless additional cognitive restructuring occurs that stimulates that movement.

Implications for Theory and Practice

We believe this model is broadly applicable and can help significantly expand the focus of research on social interactions inside and outside organizations. For purposes of illustration and brevity, however, we focused two research areas that we believe could particularly benefit from the integrative framework: organizational justice and corporate social responsibility (CSR). We summarize them here and also discuss some aspects of our framework that could use additional development in future work.

Most explanations for the concept of organizational justice (e.g. Fortin & Feelenz, 2008) are based on instrumentality and equity (Kahan & Rapoport, 1984; Sunahara & Pierce, 1982). However, these two explanations are often at odds because sometimes equity seems to rule and sometimes instrumentality does (for reviews, see Goeree & Holt, 2001; Kagel & Rogh, 1995). Recall, for example, that fair offers rather than self-interested ones are common in the ultimatum game (Chiang, 2008; Zoolman, 2008). Our model could help account for these disparate findings. Equity and instrumentality may arise from two very different mental models: expectations of parity might be seen more in the tribal-centric circle and less so in the egocentric one, in which individual instrumentality would rule. However, our integrative framework also suggests that organizational justice research should be expanded beyond a reliance on economic and equity models of behavior because these models tend to neglect studying justice beyond immediate networks of dyadic social relationships and don’t do well at examining justice across the tribe as well as with those outside the tribe.

Research in this area should begin to use broader models of justice that can more easily be applied beyond the dyadic social exchange, such as the fairness model based on the concept of groups as patches (Goltz, 2013), which recognizes that multiple levels are operating in terms of the exchange of resources and that groups simultaneously manage these multiple levels so that over the long term, equity is achieved across individuals. Still, the Goltz (2013) model seems more relevant to the second circle in our integrative framework and would need to be expanded to include a larger web of humanity and life to be truly what we mean by interdependence-centric.

Similarly, we believe that our integrative framework can help in moving CSR initiatives from the second tribal-centered circle to the third, i.e. the interdependence centric circle, which is a way to build an interconnected world. CSR as a research area has gone through multiple iterations (Frederick, 1987; Poonamallee, 2012; Waddock, 2004), starting from philanthropy and charity programs (CSR1), business benefits and bottom line impacts (CSR 2), legitimacy driven business ethics and voluntary compliance (CSR 3) and finally cosmos-centric corporations (CSR4). Although the cosmos-centric approach to CSR is a very appealing proposition, it is a normative model that is difficult to translate to practice. Part of the challenge is that unlike individuals, organizations cannot be considered to be moral actors (French, 1979; Goodpaster & Matthews, 1982; Ranken, 1987; Velasquez, 2003). Therefore, moral action must begin and end with individuals. However, a cosmos-centric approach to CSR relies on other-oriented behaviors that are extended to external stakeholders including the larger community (Poonamallee & Joy, 2012). This is even more expansive than organizational citizenship behaviors and/or prosocial behaviors that are mostly looked at within an organization, i.e. the tribal centric engagement (circle two) in this model. Instead, it is more akin to circle three in our framework. For this transition from circle two to circle three to occur, there needs to be a shift in the shared mental models among the individuals. These organizations must develop a more expansive shared social identity that will encourage atypical behaviors that not solely governed by social exchange norms. The dominant conception of mental models guiding individual behaviors are based on an agency theory perspective (Battilana, 2006; Embiryaer & Mische, 1988; Garud & Kanoe, 2001), which in turn is based on motives of self-interest (Anderson & Hill, 2002; Coase, 1974; Hendry, 2005).

This paper contributes to this discourse by outlining mental models that are more inclusive than the traditional agency theory and social exchange theory perspectives. This paper describes how these mental models may be constructed through the use of top-down and bottom-up mechanisms. This transition may be effected through the use of the mechanisms of framing and affective arousal. The cognitive/top-down process is necessary to create a mental model of an interdependent social identity. This type of expansive identity then encourages and even inspires individuals to engage in circle three type of activities. At this point, the top-down and bottom-up processing research is located in individual responses to external stimuli. Further research can explore this relationship at meso and macro levels. This approach is particularly suited to a mixed method approach combining qualitative, especially interpretive and action research approaches, along with traditional quantitative approaches.

Therefore, we believe that a framework that contains successively more expansive mental models could result in a better understanding of currently researched topics as well as stimulate new research streams. But we caution that our framework is a preliminary one meant to stimulate thought and therefore needs to be further developed.

One area that needs more examination is how this framework may differ depending on culture. Cross-cultural research posits collectivism and individualism as dimensions of national culture (Hofstede, 1980) which suggests that some countries and cultures may be prone to operating in the tribal circle than others who may be more prone to operating in the egocentric first circle. Therefore it is important to examine the role of national cultures in mental models to clearly identify the constraints of our proposed framework. It is also important to understand the effect of more local cultures. As an example, Orozco and Poonamallee (2013) discuss how the knowledge of indigenous populations, which is often based on ecological embeddedness—one's relationship with the environment, does not fit with the mental model of intellectual capital and intellectual property rights, which views knowledge as being "owned" and removes it from a sense of place. This difference in mental models creates a number of issues, such as the appropriation of indigenous knowledge. This example also illustrates that an emphasis on social exchanges as primarily based on ego-centric thinking becomes problematic as more and more business occurs across cultures which draw on different frameworks. Considering more expansive mental models than the egocentric would help in solving these cross-cultural dilemmas.

Another area in which more development is needed is in the specification of movement between circles. In our paper, we have offered some ideas of how this might occur, based on brain research. However, the framework could use more clarity on how earlier mental models (e.g., egocentric) are used, even during emotional stress, after higher mental models interdependence centric) have been developed and routinely applied. Although we believe that individuals are adaptive and tend to use the mental model that best fits the situation once they have sufficiently developed the ability to use each mental model, it is also possible that these mental models not only follow a developmental progression, such as in the neo-Kohlbergian framework (Narvaez, 2005), but also that people who use more expansive mental models tend to disparage narrower ones, as has been found in research on moral development (e.g., Rest, 1973). Concepts from the hierarchical need theories of Maslow (1954) and Alderfer (1969) might be helpful for this analysis as well. Maslow (1954), for example, discussed the concept of the prepotency process, which indicates that lower order needs must be satisfied before upward progression occurs, which suggests that use of a more expansive mental model by an organization might not be possible if a tribal identity has not been well developed. Alderfer (1969) thought that different need states operated simultaneously and that individuals could operate at higher level needs without fulfillment of lower level ones, but he also indicated that individuals might, when frustrated by their attempt to meet higher level needs, put more emphasis on lower order ones. Certainly, Alderfer’s frustration principle would be consistent with our belief that emotional triggers such as stress might sometimes stimulate the use of a more egocentric mental model. As can be seen, there is yet much to consider and explore in terms of the progression and the application of the mental models.

An additional limitation that we wish to acknowledge is that we have chosen to focus on three major types of mental models, but we also understand that one could readily identify subcircles within each of the three circles. For instance, in the second circle, family members no doubt generate a somewhat different mental model than friends, which are probably associated with a somewhat different mental model than tribal members that are acquaintances. Similarly, in the third circle, minerals, plants, animals, and humans are likely associated with different mental models for most people; for example, some of these generating a sense of connectedness more readily than others. Furthermore, we have chosen to stop at the socio-ecological in our framework, but it could be argued that mental models could be extended out further to include elements that exist beyond what we can perceive as being part of our environment. Therefore, future work in this area could both work on the more subtle layers of mental models as well as more extended ones.

Conclusion

In this paper, we have described an integrative model of engagement and the underlying mental models that govern various modes of engagement. The framework serves to extend our understanding of engagement in that it considers atypical behaviors that are not ego-centric and driven solely by social exchange norms. Specifically, it brings together research on tribal-centric prosocial behaviors, suffering-centric engagement focused on unknown others, and an interdependence-centric engagement based on traditions of spirituality and religion, and democracy, and enlightenment. This paper also draws on recent brain research on top-down and bottom-mechanisms to explain the creation of mental models thereby extending the understanding of mental models to include both affective and cognitive mechanisms.

A Developmental Behavioral Analysis of Dual Motives' Role in Political Economies of Corruption

Sara Nora Ross[1]

Abstract: This paper is a developmental meta-analysis of behaviors that contribute to political economies of corruption, deploying bioneurological dual motive and behavioral development theories. Together, these systems of analysis enable a developmental perspective to illustrate and analyze a progression of dual motives' variations as humans and their conditions change. The progression of examples indicates that there are multiple evolutions of political economies that vary in their complexity, with different behavioral features at each level. Dual motive theory helps in identifying and understanding the complex linkages and layers of socio-political and economic behaviors as they become more complex. Increasingly complex horizontal and vertical stacks of social networks, like lattice-works of dual motives, enable individuals and groups to develop and maintain sturdy yet adaptable social systems of patronage, brokerage, and clientelism. These so-often informally structured relationships underlie corruption-like transactions long before, and long after, they are regarded as the enduring institution of corruption.

Three hypotheses under gird the development of that thesis. The first is that dual motive theory facilitates meta-analyses of social networks' often hidden layers of complexity. A second hypothesis is that analyses using dual motive theory can explicate more complexity when the theory is integrated with developmental behavioral theory. The third hypothesis is that analyses made possible by that integration offer substantive contributions to understanding socio-political-economic behaviors, including multiple political economies of corruption. Three strategies are employed to develop the paper's thesis. First, the concepts of social ties, networks, reciprocity and dual motive theory are introduced to set the context. second, a behavioral task measurement theory is introduced: the model of hierarchical complexity. Scoped for this paper to introduce only the most common adult-level tasks, that model's orders of increasing complexity describe developmental differences in the performance of individuals' and social systems' behaviors. Third, a series of international examples shows the hierarchically different ways the behavioral tensions of dual motives manifest in human exchanges. The hierarchical complexity of the examples' settings is correlated with the hierarchical complexity of adults' behaviors in those settings.

The results of the analysis indicate that (a) individual and system behaviors are continuously shaped and constrained by complex interrelations that can be explained in terms of the hierarchical complexity of dual motives; (b) there are predictably difficult transitions and breaches when systems of different hierarchical complexity disrupt pre-

---

existing systems for managing behavioral tensions. The application of dual motive theory indicates its analytical usefulness for interpreting social, political, and economic phenomena. Political economies of corruption can be more thoroughly understood as enduring institutions through a developmental behavioral application of dual motive theory.

Keywords: Bioneurological, brokerage, clientelism, corruption, dual motive theory, model of hierarchical complexity, political economies, patronage, reciprocity, social networks, systems

Introduction

The purpose of this paper is to introduce a meta-analysis of corruption from a developmental behavioral perspective. A key goal is to illustrate the essential role of dual motive theory (Cory, 2006) for identifying and understanding complex linkages and layers of socio-political and economic behaviors in which individuals and systems collaborate. Another goal is to demonstrate analyses that integrate dual motive theory with the model of hierarchical complexity (Commons & Ross, 2008; Commons, Trudeau, Stein, Richards, & Krause, 1998).

This introduction begins with some general background to serve as context for the purpose of this paper and its organization. The paper's origins lie in a previous project I undertook to study social networks, called patron-client systems, in developing countries. It soon became clear that developed countries are also laced with such systems, and there are intricate linkages across and within geographic boundaries. I found that actors in the systems have different kinds of social ties (e.g., ethnic, ideological, economic), use different currencies of exchange, and the systems in which they operate mutate as socio-political and economic conditions change. At certain points in development, these behaviors come to be called *corruption*— in some quarters, but not all. My study became that of a developmental trajectory that shed light on political economies of survival. They appear in different guises as they mutate through all levels of apparently all societies. Analyzing this trajectory suggested to me why, at some point, these political economies of survival are called corruption. This paper traces the evolution of corruption through its stages of behavioral development. It introduces a thesis about the roots of corruption in perennial human systems and why corruption may be expected to be an enduring institution throughout much of the 21st century.

Anthropologists, in particular, and some sociologists and political scientists have mapped much of the picture of patronage and clientelist social networks—which come to be called corruption—through indispensable ethnographies. Through such sources and others, and through my previous critical study of the democratization literature (e.g., Ross, 2002, 2003, 2007), I noticed patterns—even as they mutated—across various individual behaviors, cultures, and social, political, and economic systems. I found no behavioral explanations for the durable patterns. I began analyzing them through the lens of a behavioral development theory, the model of hierarchical complexity (Commons, et al., 1998). About the same time, Cory's (2004) work on the bioneurological architecture of the human brain was published; it is now entitled dual motive theory. Cory's model afforded vital explanations for the vertical social glue that makes social networks sturdy, adaptable, and sometimes corrupt. Integrated with the behavioral analyses afforded by the MHC, the individual and social patterns and their shape-shifting trajectories painted a new, dynamically mixed but coherent landscape. That landscape enabled a different rendering of the political economies of corruption. It underlies the paper's thesis about the endurance of the institution.

The remainder of this paper is organized as follows. It begins with an overview of the concept of social ties and networks to introduce the concept of reciprocity. Next, a deeper explication of reciprocity briefly introduces dual motive theory, highlighting only several elements for this analysis. The next section briefly introduces the model of hierarchical complexity (MHC) by charting a limited range of its orders of complexity that are referred to in this paper. The introduction to that Model is brief and abstract because the next major section of the paper employs it in concrete examples. Such examples help to convey differences among individual and social behaviors at different developmental stages of hierarchical complexity. A series of international examples are presented to provide just enough "story" and analysis to convey dual motives' roles in social networks and institutions at different stages of development. Following those, the developmental features in different political economies are summarized to provide generalized contexts for the examples. A closing discussion suggests implications of the paper's developmental application of dual motive theory for understanding the endurance of the institution of corruption.

Social Ties, Networks, and Reciprocity

In any setting, it can be easy to overlook the role of social ties in shaping how individuals, groups, and societies function. By permeating life, they can be virtually invisible and escape reflection or analysis. The purpose of this first section is to give an overview of the evolving roles of social ties that are the focus of this paper. Such roles are more fully described in the paper's central section. The generic term, social ties, refers to social systems. These natural social systems exist because they meet the needs of people who participate in them. Those needs include basic physiological needs, physical safety, emotional safety of belonging, economic or financial security, and the safety, security, and comfort of self-esteem, among others. Each stage of human development is characterized by such basic needs, in Maslow's (1987/1954) terms. Social systems develop and endure because humans rely upon their vital functions. The primary function is to mediate the individual and group needs with the larger environment: a reciprocal relationship. All social systems are characterized by various forms of reciprocity.

Anthropologists have long identified reciprocity as a universal found in all human societies (Brown, 1991; Cory, 2004; Gouldner, 1977). It serves as a "cornerstone of morality, rational action, and group life…and *the assiduousness with which reciprocal action and reaction are watched* also suggest some degree of innateness" (Brown, 1991, p. 108, emphasis added). Reciprocity involves social *processes*. These evolve as individuals, groups, and their environments develop and change, giving rise to different forms and functions. As they become complex, they become whole systems of processes to maintain social ties. The innateness endures because it plays a major role in keeping social systems stable (Gouldner, 1977), an essential human need.

Early beginnings of reciprocity behaviors are apparent in various kinds of kinship groupings, where survival needs of the group result in the norm of reciprocity being embedded in the culture of the group (e.g., Gouldner, 1977; Lutz, 1998/1988). They next evolve into a more self-interested form, for example in demographically homogenous peasant villages where social life is very stable and self-contained, with every adult pairing with numerous others to fulfill the range of social needs (Foster, 1977). This horizontal, dyadic latticework of social relations continues to operate even as vertical relations develop to compensate for deficits: the horizontal relations cannot meet expanding needs. When kingroup and local ties become inadequate to "perform linkage functions between persons of low and high status, or between the community and the nation" (Powell, 1977, p. 149) to meet needs, vertical relations between patrons and their clients develop.

The less complex forms of social ties have three consistent characteristics. They take place between two parties of unequal social or economic status, they depend on reciprocity of goods and services, and they heavily depend on in-person contact to maintain the relationship (Powell, 1977). This structure is evident in the form of feudal (Bloch, 1961) and big-man societies (Johnson & Earle, 2002; Wolf, 1997/1982). Such social systems are not confined to historical eras; they are widespread in contemporary society, evident in gangs, tribal wars, insurgencies, and mafia operations. As social groupings enlarge with population growth and geographic expansion, information and influence become additional commodities. Brokering intermediaries, i.e., "the middle man," facilitate and extend patrons' power and reach. A broker increases the "height" of the vertical relation between a patron and his or her clients. Brokers enable expanded reach for the concrete, personal contacts required at every social level. In nation-states with centralized government—weak or strong, authoritarian or democratic—multiple layers of patron-broker-client systems develop to hand resources up and down the social-political-economic ladders. The networks extend all the way through societies' apexes of power. From the national levels of government, across business and funding agency relations, and among elites that network through them all, the latticeworks of reciprocity operate in multiple guises. This paper shows how the dual motives that underlie the give and take of reciprocity construct the political economy of the world wide phenomenon called corruption. It illustrates that there is not one political economy of corruption, but many.

The foregoing concepts weave throughout this paper. They include the innate human need for social ties, the characteristic of reciprocity in enacting those ties and keeping social systems operating and stable, and functional roles, e.g., patron, broker, client. At less complex levels of social organization, all roles are played by individuals. As social systems develop more complexity, roles are accomplished by groups, organizations, and institutions, in addition to individuals. All of the roles, as described below, enact the universal pattern of reciprocity and are characterized by dual motives within each party to social transactions.

Dual Motive Theory

Although familiar connotations of reciprocity may suggest simple exchange between two actors (e.g., a gift prompts a thank-you note, a bribe prompts desired behavior), social processes of reciprocity become complex. They underlie why humans construct their not-so-simple social systems. Groups develop norms to ensure members of the groups will be able to meet predictable needs and have sufficient social stability to do so. The case examples given below illustrate the roles of various norms. Norms are often enacted unconsciously because they are embedded in the culture of any group, rarely reflected upon all. They are “just the way things are done.” This implies *systems* of doing things: social systems. Reciprocity implies systems, even if they are subtle and embedded as norms. These systems are *how* humans meet their needs, survive, and manage social, economic, and political life.

Cory’s dual motive theory, based on the human brain’s bioneurological architecture, explains reciprocity in terms of balancing *behavioral tensions* within the individual human organism. It offers an expanded view of the complexity of managing social life. By contrast, the simplism of the term, reciprocity, masks the very complexity that needs to be understood. Cory’s concepts have more analytical power than *reciprocity* for understanding the complex layers of behaviors discussed in this paper. They alert one to the fact that these tensions play out in all human endeavors, including large social scales.

Whether informally or formally, the methods used to manage constant behavioral tensions become institutionalized as individuals and their levels of social organization evolve and adapt to changing conditions. The social sciences have coined terms to describe systems that both reflect and manage behavioral tensions. Here, the terms patron(age), broker(age), and client(elism) are used. It is noteworthy that each term has a form to refer to a particular role as well as to a *system* of roles. Dual motive theory, as applied in this paper, contributes to Gouldner’s agenda (1977, p. 37), that “a full analysis of the ways in which the whole *reciprocity complex* is involved in the maintenance of social systems would require consideration of the linkages between each of its various elements and their relation to other general properties of social systems” (emphasis added).

As the examples below explicate in increasing complexity, the concept of balancing behavioral tensions explains a seemingly paradoxical relationship. For example, despite what may appear to be individuals’ primary motives of self-deterministic “rational choice,” it makes it possible to see such individuals’ simultaneous comfort in lower ranks of power pyramids, other hierarchies, and in-groups that dictate behaviors, leaving little or no room for free agents’ self-determination. Behavioral tensions describe the ongoing dynamic of the human organism’s oscillations between self-interested ego and other-oriented empathy. Cory explicates a spectrum of decision-making oscillations that constantly move between two reciprocal poles at all scales from intra-personal to all social interactions.

1. Self-interested, egoistic behavior, because it lacks empathy to some degree, creates tension within us and between ourselves and others. The tension increases from low to high activity levels. And it increases as we move toward the extremes of ego. Within ourselves, the tension created by the tug of neglected empathy is experienced as a feeling of obligation to others or an expectation that they might wish to “even the score” with us. Within others, the tension created by our self-interested behavior is experienced as a feeling of imposition or hurt, accompanied by an urge to “even the score.”
2. Empathetic behavior, because it denies ego or self-interest to some degree, also creates tension within ourselves and others. This tension, likewise, increases as activity levels increase and as we move toward extremes of empathy. Within ourselves, the tension created by the tug of the neglected self-interest (ego) is experienced as a feeling that “others owe us one” and a growing need to “collect our due.” This tension, especially if

> > it continues over time, may be experienced as resentment at being exploited, taken for granted, not appreciated, or victimized by others. Within others, the tension created is experienced as a sense of obligation toward us.
>
> The reactions that build in ourselves and others, again, are in proportion to the behavioral tension created. And again, the unmanaged, or excessive tension is experienced as behavioral stress. (Cory, 2004, p. 25)

Through case examples from others' research, this paper puts social flesh on the concept of dual motives. All living systems have a complex of internal modes of regulation so they do not spin out of control; social systems and the individual human are no exception. In short, they are feedback systems. Behavioral tensions are human and social regulators. When tensions increase, they deliver information to organisms and systems that things are moving further from a more stable-feeling, comfortable equilibrium. When tensions decrease, there is a sense of more stability and safety. Behaviors of individuals, social groups, and societies both manage and indicate these tensions through giving and receiving feedback.

Individual and social systems are laced with feedback processes. The latticeworks of vertical and horizontal social organization described in this paper are complexly layered feedback systems. They have been studied under the names of patronage, brokerage, and clientelism. On the surface, they may appear to deliver only the goods, services, information, and influence that are discussed in examples below. Beneath the surface, there is a universal bioneurological basis *for* the behavioral activity: reciprocal interactions to manage behavioral tensions. Each interaction delivers and elicits feedback about current and expected stability. The feedback offers a stimulus; if received, there is a response. The perception of stimuli and the responses to them depend upon the hierarchical complexity of the individual or social system involved.

Model of Hierarchical Complexity

The model of hierarchical complexity, originating from work in the late 1970s and early 1980s (e.g., Commons, & Richards, 1984) stands as a universal, cross-cultural, cross-species theory (see Commons & Ross, 2008). Its application is independent of context and content. As a behavioral task measurement theory, it distinguishes between stimuli (task) and response (performance), and distinguishes discontinuous, scorable orders of complexity that apply across any domain of activity (for examples and more discussion, see Commons, Rodriguez, Miller, Ross, Locicero, Goodheart, & Danaher-Gilpin, 2007). While it defines 14 orders of complexity, ranging from simple machine language to innovations of geniuses such as Einstein, only four orders apply to the stages of individual and social behaviors evident in the spectrum presented here. Those orders are introduced briefly in Table 1.

Table 1. Orders of Hierarchical Complexity Evident in Political Economies

Order or stage	Order or stage name	General descriptions of tasks performed
8	Concrete	Carry out full arithmetic, form cliques, plan deals. Do long division, follow certain social rules, limited ability to take and coordinate perspective of other and self. Use variables of simple interrelations; talks about concrete evens, e.g., social events, what happened among others; makes reasonable deals. Task: There are behaviors that order the simple arithmetic behaviors when multiplying a sum by a number. Such distributive behaviors require the simple arithmetic behavior as a prerequisite, not just a precursor. $5(1 + 3) = 5(1) + 5(3) = 5 + 15 = 20$ Also: Short time horizon, avoids shame,
9	Abstract	Discriminate variables such as stereotypes; use logical quantification; form variables out of finite classes; make and quantify propositions; use variable time, place, act, actor, state, type; uses quantifiers (all, none, some); make categorical assertions (e.g., AWe all die.@); Form a class based on an abstract feature. Task: All the forms of five in the five rows in the example are equivalent in value, $x = 5$. Also: Seeks group membership, status, and is loyal to in-group and dogma; places high value on saving face.
10	Formal	Argue using empirical or logical evidence; logic is linear, one-dimensional; use Boolean logic=s connectives (not, and, or, if, if and only if); solve problems with one unknown using algebra, logic, and empiricism; form relationships out of variables; use terms such as if . . . then, thus, therefore, because; favor correct scientific solutions. Task: The general left hand distributive relation is $x * (y + z) = (x * y) + (x * z)$ Also: seeks causes and solves problems based on one input (causal) variable; reflects dogmatism; accepts feedback only from objectively acknowledged masters; uses longer-term thinking to achieve results.
11	Systematic	Construct multivariate systems and matrices, coordinate more than one variable as input; situate events and ideas in a larger context, i.e., considers relationships in contexts (e.g., present and historical); form or conceive systems out of relations: legal, societal, corporate, economic, national. Task: The right hand distribution law is not true for numbers but is true for proportions and sets. $x + (y * z) = (x * y) + (x * z)$ $x \cup (y \cap z) = (x \cup y) \cap (x \cup z)$ *Symbols:* $\cup$ = union (total elements); $\cap$ = intersection (overlap, elements in common) Also: Constructs higher level abstractions (e.g., "transparency," "accountability," "legitimation"); exhibits relativism while juxtaposing multiple relations; inclines toward infrequent judgment of others; starts to recognize self as system.

Note: From "Applying the model of hierarchical complexity" (pp. 61-62), M. L. Commons, J. A. Rodriguez, P. M. Miller, S. N. Ross, A. Locicero, E. A. Goodheart, and D. Danaher-Gilpin, 2007, Cambridge, MA: Dare Association, Inc. Copyright 1991-2007 by Dare Association, Inc. Adapted with permission.

A Developmental Trajectory of Examples

To provide tangible contexts for how dual motives manifest in social processes and systems, the examples below illustrate their developmental progressions of increasing hierarchical complexity. The first sections illustrate how dual motives play out in simple societies scored at the concrete stage. The next sections illustrate more complex behaviors and social systems, first at the abstract stage and then at the formal stage. The progression indicates what people and groups do to adapt and meet changing basic needs. Hierarchical complexity accounts for the differences in how the dual motives of self-interested ego and other-oriented empathy can be seen to play out in these social systems.

Figure 1 serves as an orienting framework for the progression to increasing social complexity covered in the examples, portraying both horizontal and vertical systems of social ties. The vertical layers indicate that patrons, themselves, are clients of the next higher layer. Figure 1 emphasizes this analytical insight because it is crucial for understanding political economies: dual motives manifest in the same person or entity *differently* because dual social roles are played. The vertical layers indicate that an intermediary brokerage role develops between patrons and their clients. As the examples narrated below become more complex, they are accompanied by more discussion to explain and highlight key features. Indicated but not discussed is the effect of squeezing lower level networks out of the mainstream (but see Ross, 2006). A summary of the most relevant analytic features is provided after the progressive presentation of examples is completed.

Figure 1. Evolution of social complexity: Latticeworks of Dual Motive Relationships

Survival and Safety: Concrete Behavioral Tasks Exhibit Ego and Empathy

A small family or tribal group or village society characterized by simple, sequential reasoning illustrates the roots of ego-empathy power relations and human tendencies to socially organize around meeting the demands of dual motives. Lutz's (1988/1998) ethnography of the Micronesian Ifaluk indicates that Ifaluk claims of *justifiable anger* are the real indicator of power relations and the core moral code of that society. Lutz's case shows how concrete stage reasoning balances ego-empathy behavioral tensions.

In Ifaluk society, where dangers are daily concerns, the norm of calm, nurturing behavior helps ensure that people (a) do not frighten one another, which would add stress to their already stressful subsistence conditions, (b) live the norm of caring for each other, and (c) feel secure in relationship-attachments that otherwise feel at risk of loss (Lutz, 1988/1998). While Ifaluk portrayed care and nurture as "mature and altruistic," Lutz had another observation: that care of the needy (e.g., those without kin) "allows for and legitimates control over the needy person….. [if denied] the opportunity of caring for others, they are unable to control others, and in being unable to do so, they cannot command respect, which has both socioemotional and more tangible rewards" (p. 142).

The script that plays out in everyday Ifaluk life when justifiable anger is expressed (Lutz, 1988/1998) reflects ego and empathy oscillations of dual motives. An objectionable action is performed by person 1, evoking expression of justifiable anger by person 2; thus chastised, person 1 is expected to become "fearful/anxious" (p. 175) and the expected conformity with harmony is restored with each person's status, at that time, clarified in the process. Person 2 demanded respect in reaction to the behavior and person 1 accommodated. Lutz observes that such daily occurrences are "like a red flag, marking the form of, and fissures in, Ifaluk sociopolitical structures" (p. 174); in Cory's terms, these are the behavioral tensions of daily life. Lutz reports that in most cases, such interchanges reflect the social hierarchy by the downward direction of the flow of justifiable anger from one who is older or otherwise of higher status to one who has lower status. Thus, the social system's equilibrium is under constant maintenance, in effect by every member in the system as he or she performs a norm-dictated role.

More Concrete Transactions: A Precursor Form of Patron-Client Systems

Various kinds of small social systems display the roots of later, more explicit forms of patronage. Anthropologists identify different social structures in lineage descent and bilateral kinship groups in peasant villages. A model for the social structure of the dyadic contract in peasant villages shows a precursor form of patronage.

Foster's (1977) model proposes that in societies with structural features similar to peasant villages such as Tzintzuntzan, Mexico, where residents share the same socio-economic status, that "every adult" develops informal but real contractual relationships with contacts beyond the immediate family (p. 16). Sometimes called *compadrazgo*, referring to god-parent (compadre) relationships in Catholicized areas, the dyadic relations go beyond the godparent role and can include siblings, neighbors, and friends. There are two distinct forms these contracts take, both based on reciprocal relations, and we can image them together as forming a social latticework with both horizontal and vertical dimensions: this latticework appears throughout the remaining analyses here. Foster's analysis focuses specifically on the first of the two dynamics; later sections of this paper discuss forms of the second dynamic via separate cases.

The symmetrical contracts Foster examines most closely are made between socio-economic equals, whether of the same village or another. The reciprocal exchanges of goods and services are complementary by virtue of being basically the same over time, and are "continually exchanged" as the "glue that holds his [sic] society together and the grease that smoothes its running" (pp. 17-18). For the adult, these exchanges link the institutions of family, compadrazgo, and neighbors and friends into a coherent social world, and to the observer, that social world is a crisscrossed network of many linkages and many individual nodes. Foster found that "no two people have the same combination of compadres" (p. 22), as is the nature of dyads (Lande, 1977). A key characteristic of these contracts is that they represent the solidity of the relationship, and while they are in effect, they never balance out to zero. In bookkeeping terms,

> A functional requirement of the system is that an exactly even balance between two partners never be struck. This would jeopardize the whole relationship…the contract would cease to exist….The dyadic contract is effective precisely because partners are never quite sure of their relative positions at a given moment. As long as they know that goods and services are flowing both ways in roughly equal amounts over time, they know their relationship is solidly based. (Foster, 1977, p. 23)

The overall social stability of such peasant villages is due to the thoroughly embedded symmetrical dyads. Because such communities' inhabitants share the same socio-economic status, there are no factions, no divisive dynamics. Foster explains that villagers tend to be distrustful, suspicious, and back-stabbing toward their neighbors, and attempt to diminish any who gets ahead. The result is that they are "reluctant to join in cooperative enterprises of any kind" (p. 20), and they resisted all previous "outside attempts to stimulate cooperative action for community improve[ment]. People consistently are reluctant to work with others toward group goals" (p. 27). Thus, when a society is so thoroughly constructed as a network of dyadic relations, where no two people have the same compadres, nothing concrete arises for people to set themselves for or against that would otherwise result in factions. Such communities are striking examples, then, of humans constructing very stable, resistant-to-change social systems, where subsistence, security, and social nurturing needs appear to be adequately met within the system. The village bickering and backstabbing, conflictual dynamics offer the behavioral tension-releasing side of the reciprocity-power relations dyad. This form of managing dual motives appears adequate to meet individuals' needs at the concrete operational level. It results in mild degrees of interior and exterior tension.

Since the remainder of this paper focuses primarily on the asymmetric and vertical patron-client relations, it is important to underscore that this horizontal lattice of social networking comprised of dyadic relations is concurrent and also serves the vertical relations in various ways, some of which will be highlighted. The first way it serves them, of course, is by being a prototype for the vertical contracts, and secondly, they form a broad firm base of reliance on the higher social layer of patrons and brokers. Such horizontal relationships are means by which humans survive when societies sever or do not construct a social contract with their members.

This is the underbelly of developed societies, and in Figure 1 is represented by those systems that have slid out from under—or been squeezed out of—the main social structures, to the fringes of society.

Early Forms of Patron-Client Systems: Big-Men, Chiefdom, and Feudal Societies

Asymmetrical contracts are qualitatively different because the two parties have different socio-economic statuses and exchange non-complementary goods and services that are different in nature from one party to the other (Auyero, 2000; Foster, 1977). These represent the patron-client relationship. The flow of exchanges always takes place over time as an inherent feature of the social structure, but "it is difficult and sometimes impossible to strike an equivalence in time and monetary value" (Foster, p. 17). This discussion combines several societal forms that develop from different trajectories, times, and places, because they derive from the same levels of hierarchical complexity and illustrate common functions and relationships—including those evident in the highest reaches of today's advanced societies.

As societies become more complex, the layers of explicit stratification grow. Where the Ifaluk had two distinct layers, the people and the chiefs, more complex societies generally evidence four: the immediate household, a cluster of patrilinear households, clan, and local geographic group (Johnson & Earle, 2000). Now the social layers and scales appear clearly, each having horizontal and vertical networks that could be imaged as a four-dimensional social latticework that expands and evolves over time. From this village level of organization spring the dynamics of competition for leadership and status, and needs for representation with outsiders and early forms of political economy (Johnson & Earle, 2000).

In kinship groups the whole organization of society is oriented to the corporate group and maintaining exchange networks to furnish basic needs (Johnson & Earle, 2000). As circumstances and needs dictate that exchanges must be sought with outsiders, chiefs of kinship groups become the first patrons to study. The social systems and their assumptions generated by humans operating at this concrete stage of development will demonstrate, below, the progression to domination/submission as tensions between reciprocity and self-interest move further out of balance between the poles in dual motive theory's algorithms. Through this focus on big men, chiefs, and feudal lords emerge stark looks at the patron's needs and function, the development of factions, an introduction to the context of brokerage, and the needs of clients. These elements construct a picture like an x-ray by which to gaze at the skeleton of contemporary social structures, including those that support corruption.

Patrons by definition must have resources to provide their clients—the group—and those resources introduce new social classes of haves and have-nots. Such a chief needs to create the institution of political power that kinship groupings lack, a radical transformation of the societal structure involving new leader-follower and in-group, out-group classes (Johnson & Earle, 2000; Sahlins, 1977; Wolf, 1982/1997). He can do this only by developing "new political instruments of domination" that guarantee him "independent power over resources," and the redirection of some of the social labor under his control is the mechanism available (Wolf, p. 99). The exploitation inherent in this mode of production is starkly evident as the big-man stockpiles a "fund of power" (Malinowski, as quoted in Sahlins, 1977, p. 223) and creates and exploits relations to "give him leverage on other's production and the ability to siphon off an excess product—or sometimes he can cut down their consumption in the interest of the siphon" (Sahlins, 1977, p. 223). Stemming from inhabited environment and whether a society is pastoral, horticultural, or coastal, the resources and surpluses that big-man leadership controls may be primarily defensive or economic in nature (Johnson & Earle, 2000) but the extraction dynamics that develop are found in those big-man polities that are "well delineated" (Sahlins, 1977, p. 224).

It has been observed that followers' compliance is a result of relationship-specific motivations in connection with the leader (Pospisil, as cited in Sahlins, 1977). Sahlins takes the systemic analysis deeper, citing an inevitable contradiction embedded in the relationship. The *initial* reciprocal relationship between the leader and each of his factional followers (discussed below) has the general asymmetrical structure of patronage. As it becomes complicated by the demands of keeping resources flowing and of increasing power and renown, the structure begins to feed on itself to keep the cycle intact. This classic pattern merits Sahlin's own words.

> Here it is important that not merely his own status, but the standing and perhaps military security of his people depend on the big-mans' achievements in public distribution. Established at the head of a sizeable faction, a center-man comes under increasing pressure to extract goods from his followers, to delay reciprocities owing them, and to deflect incoming goods back into external circulation [rather than to immediate followers]. Success in competition with other big-men particularly undermines internal-factional reciprocities: such success is precisely measurable by the ability to give outsiders more than they can possibly reciprocate…. Some center-men appear more able than others to dam the inevitable tide of discontent that mounts within their factions…. But paradoxically the ultimate defense of the center-man's position is some slackening of his drive to enlarge the funds of power. The alternative is much worse [and is illustrated by his subsequent list of sometimes gruesome consequences captured in the anthropological record]. (pp. 223-224)

In a similar way, feudal systems developed when kin group ties "proved inadequate" and were unequal rather than hierarchical structures, with "rigorous economic subjection of a host of humble folk to a few powerful men" (Bloch, 1961, p. 443). Bloch traces how feudalism in Europe—which existed elsewhere, e.g., Japan—was the result of the "violent dissolution of older societies" (p. 443). The record suggests people in feudal times demonstrate the same concrete reasoning structures as other early social systems, which may be an integral, contributing factor in the violent dissolutions. Violent concrete stage behaviors are also observable in contemporary times, whether in Somalia, Sudan, Iraq, Afghanistan, or in inner cities.

The tensions for the big-man, chief, and feudal lord systems arise from the conditions that gave rise to the structures themselves. As such leaders create and maintain a following, or faction, and engage their dealings with the environment outside that circle, they situate themselves in the tiny neck of an hourglass, with time and supplies always running out before the pole's demands must be filled, often from the same source it just supplied. Sahlins (1977) likens this inherent pressure on such a "center-man" to "a kind of two-sidedness in authority…a division of the big-man's field of influence into two distinct sectors" (p. 222). The smaller sector is the internal one comprised of personal followers, which Sahlins reports can number up to 80 in, for example, Melanesia. This is about the maximum size for concrete stage leadership to manage (M. Commons, 2005, personal communication). Big-man collectivities can range in size from 20 to 800, and chiefdoms communities from 200 to 500 (Johnson & Earle, 2000). The latticeworks of social pyramids enable larger populations to be coordinated.

From the realm of internal power over followers there is a "qualitative change" as the big-man turns outward to the larger "tribal galaxy" where not power but "only fame and indirect influence" (p. 222) are his tools to compete against other such leaders. The evolutionary dynamic of leaders rising to powerful positions in control of resources includes public vertical relationships beyond those found in family groupings. Big-men factions in large communities faced a pragmatic demand of dual motives to serve the sorts of functions discussed next.

The Appearance of the Brokerage Function

Warfare, leaders' extravagance, the exercise of powerful control, and new modes of production characterize these societies, but should not be a distraction from another important social structure that evolved as an integral part of those activities: brokerage rooted in the early factions that were the first public, vertical relationships. In both chiefdoms and feudal societies arise the early forms of brokerage, in the warrior elite (Johnson & Earle, 2000) of the former, and in the lords' knights, vassals, and tenants (Bloch, 1961) of the latter. Regardless of setting, the function of brokerage is to extend the reciprocal reach, influence, control, and power of the patron. The personal contact required at the developmental stage of concrete operations appears consistently throughout these different societal contexts and evolves naturally from factions to brokerage.

The roots of this function originate in the core need met in dyadic relationships: the concrete, face-to-face contact with the other party to the agreement. This connective function is essential since, outside of periodic public performances, the leader cannot be everywhere at once and needs surrogate functions performed by his followers. The chain of vertical relationships can take the form of a pyramid, where each follower develops a layer of followers beneath him that extends his reach in passing resources up and down the social and economic ladder (e.g., Schmidt, 1977). At each layer, the face-to-face contact serves as the social glue. Brokers have a clientage relationship with their patron, and a patronage relationship with their clients, forming the basic building block of the pyramid structure in Figure 2: "Thus the patron-broker-client network pyramid is created by the stacking up and combining of many dyadic patron-client networks" (Schmidt, 1977, p. 306). Depending on population size and its needs, and the locus and distance of resources to meet those needs, the pyramid rises into higher social levels comprised of the same patron-broker-client building block.

Formal Government Program, Abstract Leadership, and Concrete Followership

Once brokerage's systemic function became more widely studied through accruing case studies of more complex societies, the term *clientelism* developed as a general way to refer to the social structure of patron-broker-client (Scott, 1977). When this structure operates in the context of political parties—as it seems to always do, although also in other contexts—it is called *political clientelism*. Auyero (2000) adopts the term "*personalized political mediation*" (p. 26, emphasis in the original) to highlight the functions of "problem-solving networks" among the poor, "the *microphysics of politics*" (p. 24, emphasis added). As this case indicates, that microphysics is thoroughly economic as well.

The barest essential features of this microphysics are: (1) the thorough embeddedness of clientelism in socio-political life; (2) how clientelism derives from concrete and abstract stage behaviors and affects individual and collective development; and, (3) how the norm of reciprocity manifests in the economic relations and transactions. These are organic system dynamics that illuminate ego-empathy behavioral tensions. The presentation of an Argentine shantytown case takes the form of a summary of the clientelist practices and graphic images of the complex networks of actors' dual motives therein.

Before illustrating the clientelist structure Auyero describes, the narrative in this section sketches primary features of his network findings, with occasional bracketed supplements of my own.

1. Around each person in a leadership role there is an inner circle or faction characterized by intense, frequent personal relationships. Depending on the leader, family members may be active participants in the faction. Ties between the leader and members of the inner circle are thus fictive kinship if not blood kinship in nature. The leader of a faction has a dyadic patronage relationship with the clients—"personal satellites" (Sahlins, 1977, as quoted in Auyero, p. 91) —who are in this inner circle (and familial relationships may co-exist with it). The degree and nature of personal contact correlates with the leader's influence. People performing top-of-the-pyramid functions have a circle of closer contacts than those performing mid- or bottom-of-the-pyramid functions with less intense but nonetheless face-to-face dyadic contacts. This core feature results in vertical networks of relationships. Members of a leader's inner circle do not compete with each other unless their self-interests are at stake in a particular situation. Note that leaders of different factions on each socio-political scale of influence comprise an elite at each scale. This results in horizontal elite networks.

2. Each person in the inner circle depends in some way upon the leader's patronage and serves the leader's needs in degrees that depend on the leader's span of influence and the nature of activities chosen to promote it. In order to serve the leader's needs and (conscious or unconscious) self-interests that can be served by doing so, each factional member develops and maintains a factional inner circle of his/her own. Note that this results in an elite at a lower social scale, another horizontal network.

3. Means of being accessible to and attracting more clients are essential, and take various forms, because they serve as the infrastructure of the clientelist pyramid that conducts the flows of resources and services. Local base units (*Unidad Basica,* or UB, in Villa Paraiso; precinct or ward in the U.S.) provide physical location for face-to-face client contact, just as do regular visiting hours or soup kitchens conducted in a broker's home.

The opening of new physical locations is a means of creating or expanding territory to increase a base of political power.

4. To gain and remain in a brokerage position, the two central functions of "gatekeeping and information hoarding" (p. 96) are essential. Since the flow of goods and services down to clients correlates directly with the volume of services received from clients, strategies include both obstructing and facilitating flows to certain constituencies. Public service and other information is funneled through elites to pass down to their followings; the more vital the information that is hoarded (e.g., dates for periodic distributions of specific food rations), the more dependency that is created.

5. Horizontal family and neighborhood networks reciprocate in serving poor persons' survival needs. Members of these informal networks may be clients of different brokers (defined above as a patron from the client perspective). Additional horizontal networks develop and overlap among people at various social scales as high-level patrons' diverse activities are furthered by numerous members of inner circles at the different social scales. These overlapping relationships at scales from bottom to top comprise multiple sets of dual motives' problem-solving network, the structure of political clientelism.

6. There are gangs outside of the network that people in the networked system look down upon and are fearful of.

The clientelist system of problem solving is comprised of these core features, at minimum. Fractal-like, factional circles form around elites at each social scale, resulting in multiple pyramids of localized influence. Each node in the network strengthens both horizontal and vertical ties, which satisfy as many subjectively defined core needs as humans have been able to devise to do so. The following two graphic illustrations together portray the overlapping vertical and horizontal networks evident in this case. Figure 2 presents the pyramidal structure of the Para Vida program (which seems representative of state-level social welfare programs in general), and Figure 3 shows the functions for handing resources up and down the pyramidal structure in a depiction of the shantytown's network of vertical relationships. These are comprised of roles for individuals and organized entities such as brokers' community centers, indicated as "UBs."

Key to Figures 2 and 3: The dual-colored circle is used to represent dual roles as patron and client within a larger system. The circle may stand for an individual, group, or organized entity that has dual roles. The green half is positioned in the figures to indicate the receiving role of a client in the network system. The orange half is positioned to indicate the delivering role of a patron in the network system.

Political Clientelism: Developmental Shape-Shifting

As living systems, humans' social system dynamics adapt organically to changes in the environment, while retaining earlier capabilities that may be important insurance if the environment reverts to previous conditions. When conditions make it feasible, it is more efficient, productive, and satisfying to adopt new ways of relating and conducting transactions that replace earlier modes. Komito (1985) investigated how Dublin residents manage to acquire needed resources, especially those available from state agencies, and "traced the exchanges between voter, politician, and bureaucrat that revolve around public needs" (p. vi). He found that information needs outweigh material needs, while also identifying where the state has failed the social contract to assure the poor's basic needs are met. He found that

> Irish clientelism is no less significant for this lack of material exchange. Clientelism provides voters with a personal and moral link with the state and so maintains support for the existing political and administrative structure. It compensates for the relative impersonalism of universalistic values by infusing exchanges with personalistic qualities of trust and solidarity. Finally, this study shows the importance of information as a brokerage resource. The structures and procedures of the state bureaucracy prevent the public from having access to information about state benefits. This closed bureaucratic system makes information a valuable resource for politicians. (p. 163)

From the top to the bottom, "an Irish political party is a pyramid of patron-client links" (p. 62). The needs of the politicians at the apex of a party pyramid are concerned with recruiting and maintaining "allies" (p. 61) and clients to buffer threats from party conflict and competition at that level. Their patronage activity includes control of positions into which a lower level politician can be placed as a client that helps the senior member in various ways depending on the position (e.g., votes, interpersonal conflicts). The client's benefit is the acceleration in the climb through the party ranks. Each of the levels running from local up to national have characteristics of big-man societies in the cut-throat competition within each horizontal plane. At the local level the "zero-sum game" (p. 56) is characterized by such conflict.

> The conflict within the local party arena goes on all the time and is the reason why politicians are always attending party branch meetings; they want to keep things under control. The basic question of constituency politics is "whose man are you?" and it is impossible not to be somebody's man. There is no way to avoid local factional conflicts; one must be aligned to someone. Local branch politics do not permit a person to be neutral; if he tried to be, he would simply be trusted by no one. (p. 58)

Brokering With the Public. Expectations of brokerage services are linked with socio-economic class *origin* rather than current status. He found "socialization has a lasting influence on *beliefs* regarding politicians' roles as brokers, which is not altered by subsequent changes in socio-economic circumstances… [to the contrary] current class status, rather than class origin, determines brokerage *strategies*" (p. 82, emphasis added). The personal contact that characterizes the local politician's dyadic relation with a citizen results in a patron-client relation at the dyadic level with a brokerage function at the systemic level. The politician's big-man party behavior transforms into that of a kindly, attentive, and patronly figure when nurturing relations with potential voters. In Dublin, the transaction *content* is that of information and services from the patron role, rather than provisions of sustenance needs and other material goods, or personally hiring a client to obtain services from him/her. Further, the information and services are public in nature. Komito observes that "Irish politics appears dominated by the 'privatization' of public goods: politicians provide (or appear to provide) government services to voters who, in exchange, become their clients" (p. 103).

However, politicians assume that many clients shop around for the best bargain available among nearby politicians, and further, they have no way of knowing if a client actually casts a vote for them. Their attempts to cultivate connections with individuals are designed to "create the aura of a special personal relationship [that will] engender a sense of moral obligation on the part of the voter, who will reciprocate at election day" (p. 102).

The Role of Bureaucracy. Since there is no guarantee of payoff from helping clients, politicians use their knowledge of the system and social programs to write to or contact appropriate officials, often impressing clients with their ability to get results: "They exaggerate their influence over state services in order to make a greater moral claim on voters' support. [They] encourage voters' dependency, and make little attempt to disabuse them of their beliefs in the efficacy of brokerage" (Komito, 1985, p. 112). Those beliefs play a role in the endurance of brokerage. In behavior analysis, the delivery of reinforcement independent of behavior produces extremely strong responding. The fact of the non-contingent nature makes the behavior quite independent of the consequences; this fosters superstition (M. Commons, personal communication, June 2005).

A multi-leveled look at the Irish bureaucracy's entrenchment as a barrier of "distrust and anonymity" (p. 147) between its servants and the public indicates that the "administrative system operates to restrict information to a very few people" and results in giving politicians "control over these resources of access, information, and influence" (p. 114), thus, "instead of reciprocal rights and duties, the welfare scheme becomes authoritarian; the official makes any decision he wants and the applicant is dependent on his magnanimity" (p. 115).

The Abstract/Formal Mixture of Dublin Clientelism. The Dublin study describes a stable social system operating at a level above that of traditional clientelist forms that meet daily subsistence needs. It provides an important look at the interacting dimensions of culture, structure, and individual needs and capacities that make Dublin clientelism, at the time of the study, a durable, closed system. Clientelist behaviors are integral to the lives of a significant portion of the population. At the core of the system are its institutionalized structural supports. At this abstract/formal stage mixture of social development, the presence of an impersonal, inefficiently layered bureaucratic structure both makes possible the social contract constituents need and also blocks not only access to its benefits but also their continuing need for concrete, dyadic personal contacts as they navigate their lives. The hierarchically rigid, procedural-bound civil service is the perfect environment for the conventional, abstract reasoning of the career bureaucrats trained into the system. In their isolation, the only needs that are concrete to them are their own and that of preserving the status quo.

In this system, politicians "are forced" (p. 106) to create as many personal links as possible to get votes to beat intra-party competition. Politicians' efforts to build wide horizontal networks through their close followers and community clients are required by the pyramidal patronage form and function of the party that forces them into the community and its needed brokerage roles to survive as politicians. The civil service and party structures are both products and agents of the cultures that shape them and the different actors' needs within and without.

Komito mentions only tangentially a crucial dimension in socio-economic behavior analysis: those citizens whose status or capacities result in low levels of contact with government services. When they need services, they rely more upon their contacts with family, friends, neighbors who are officials, and occasionally politicians, because the system does not "work" for them, either. Political clientelism operates at a social level beyond the very poor's daily subsistence needs.

> To some extent, clientelism is a formalized preference for dealing with friends. Personal contacts are formalized throughout Irish society…. There is, in Ireland, a "tendency to operate through personal contacts rather than through organizational procedures" (Pyne, 1974: 34) but the resource of "personal contacts" is unevenly distributed throughout the population. It is the unequal distribution of such contacts, due to economic and social differences, that is relevant. (p. 161)

Developmental Spectrum of Patronage and Clientelism in the U.S. System

U.S. cases provide a look at patronage and clientelism in political parties and Congress. These dynamics constitute the overall system. Periodic uproars over such unveilings as the Abromoff scandal and more recently, the U.S. Justice Department's firing of prosecutors suggest only the tips of ongoing patronage systems few seem to assume endure. Freedman (1994) acknowledges that, in the U.S., patronage is considered by many to be a largely bygone institution that no longer plays a meaningful role in U.S. politics. Her own and others' suspicions are that

> patronage is still a feature of the American political landscape. Unfortunately, with few exceptions, those who are in the know don't want to talk. Patronage has gone underground. No one wants to admit to a practice that bears the taint of corrupt machine politics. And, now that many forms of patronage have become illegal as a result of a series of laws and Supreme Court decisions, openly discussing patronage has become even more foolhardy. Probably because of the obstacles involved, the [U.S.] literature on patronage is quite sparse. (p. vii)

Whether or not patronage is viewed as tainted is a matter of perspective in the US and elsewhere. In 1990, the U.S. Supreme Court's majority ruled in the Rutan case that patronage, in the form of politically based hiring, was unconstitutional. Justice Scalia wrote in his dissent that patronage is a "venerable and accepted tradition" and "bears the endorsement of a long tradition of open, widespread, and unchallenged use that dates back to the beginning of the Republic" (Scalia, 1990, as quoted in Freedman, 1994, p. 8). The Rutan case and Freedman's usage of the term confine patronage to the rewarding of supporters with appointments to government jobs for partisan reasons. Indicative quotes below indicate the role of dual motives in the practice U.S. patronage.

> "You can't keep an organization together without patronage. Men ain't in politics for nothin'. They want to get somethin' out of it." (Plunkitt, Tammany Hall leader, in Riordon, 1963, as quoted in Freedman, p. 15)

> "You've got to have people in government who are politically smart. ... This means they have to understand that part of politics is the art of obligation." (Lindsay, late-60s New York mayor, in Tolchin & Tolchin, 1972, as quoted in Freedman, p. 25)
>
> "If we can't have fun by getting our side in, we shouldn't be a party to begin with …. I don't need the hassle of politics if I can't get my friends and children jobs." (Indiana politico, in 1990 *Indianapolis Star*, as quoted by Freedman, p. 82)

Clientelist structures enable dual motives to develop new forms of exchange for meeting new needs. As the environment allows some individuals' basic in-group identity and rule-bound (and thereby security) needs to be met sufficiently, ego needs for self-determination emerge as a natural course of development, and. their reasoning gradually develops the strategic capacities that reflect a formal, linear logic stage of hierarchical complexity. The time horizons incorporated into strategies become longer than could be considered earlier, and transactions can be conceived of as exchanges with a less concrete nature than jobs, although jobs continue to be a currency of exchange. While "individualist" is a label frequently applied to behaviors at this stage of hierarchical complexity, it emphasizes the ego-pole, masking the deeper needs still operating beneath the surface toward the empathy-pole. The empathy side is evidenced in behaviors that are still highly conventional, with the individuals attached to their identity with in-groups that may now be chosen for strategic purposes. The vertical patron-broker-client pyramid is a comfortably familiar structure where they know the ropes and the rules of the game and can enact their hero's journey" up the organizational ladders and across the horizontal networks of the political and business playing fields. At this stage, there is no desire to change the structure; rather, due to its familiarity, it can be "worked" to advantage. At this stage, there is savvy aplenty to launder the transactions by whichever currency of exchange will seal the deal.

In all too frequent error, the individualistic side of the human coin at this stage is mistaken *as* the coin. This may be the chief reason that the scale of systemic patronage and clientelism in the higher reaches of U.S. and other Western institutions go mostly unrecognized for what they really are. And too often, the *corruption* label artificially detaches acts and their actors from the systemic cord that traverses an entire network of exchanges, like the Peronist problem-solving network represented in Figures 2 and 3 that suggest the hierarchical skeleton of social structures that are innate at several levels of human development.

Based on humans' evolutionary trajectory to date, it is evident that they have a "predisposition for hierarchically structured social and political systems" (Somit & Peterson, 1997, as cited in Cory, 2004, p. 26). Most social structures are the linear ones inherent in hierarchical organization. This tendency can be accounted for in a number of ways; for simplicity here, I select three related factors. The socio-cultural evolutionary path traced in this paper demonstrates that humans build on and modify their social systems in the course of adapting to changes in the environment, retaining successful ways of relating and creating new ones. Thus, ancient patterns are carried forward as long as they continue to work the way the user needs them to work. From the developmental perspective, the imaginative and logical capacity available to create new ways of relating is limited (and conversely, expanded) by the structures of reasoning people have managed to develop in their socio-cultural context. Finally, the bioneurological dimension plays a dynamic role in how humans interact within the social systems they create.

An integration of these three dimensions can explicate the polarity of ego and empathy in the widespread strategic-individualistic stage of hierarchical complexity, the formal logic of rational choice agents. The idea of the rational choice agent appears not only in political science but also in economics. Cory's critique of prevailing economic theory is at the same time a critique of this prevailing idea, because economic assumptions have been based on it. He explicates the "logical fallacy" (p. 80) and its shortfalls, essential in understanding political economies of corruption.

> The confounding of *self-reference* with *self-interest* is, in fact, a fundamental fallacy of the entire traditional economic approach. The fallacy allows the subsuming of all motives under the rubric of self-interest and obscures the roughly equal role of empathy. Taking the individual as the starting point, microeconomic theory [and often, political theory] mistakenly *transforms* this individual or self-referential *perspective* into an all-inclusive *motive* of self-interest. From this logically unwarranted transformation any other motive is, thus, obscured or swallowed up in self-interest. Therefore empathy—and its derivatives of cooperation and altruism, even love—cannot be considered true motives. They must, therefore, be trivialized as tastes or preferences indistinguishable in significance from such banalities as coffee, tea, or milk. But as we saw . . . under the sweeping searchlight of the social brain dynamic, the hidden duality of ego and empathy is revealed in every demand curve [domination] and supply curve [submission], especially when both are combined to show price [social-political] equilibrium. The dual roles are always present implicitly if not explicitly. The supplier performs the empathetic role; the demander performs the egoistic role. (p. 80)

One pitfall of such assumptions is misapprehending the real nature of human transactions. However, it is possible to develop a more realistic understanding of agents' behaviors. For example, the transaction between a client and broker can look like power/ego in the broker prevailing over powerless-need/empathy in the client. The lens can simultaneously view the supply/empathy in the broker and the demand/ego in the client. Herein may lie the secret of the social system's stability, stable as long as it "feeds the balance" of each transaction-party's poles in sufficient degrees to keep them in the system. And they are locked in the system, from their perspective, when no alternative exists.

A hierarchical structure affords a comfortable operating environment for many individualistic persons because it supplies the demands of both ego and empathy poles in an extremely stable fashion. Especially initially, the goals and challenges such persons set for themselves in work and social environments tend to stretch the ego's confidence as it launches out on its own. There is ballast, though, in the in-group(s) of chosen association, like a safe harbor to return to, and this anchoring in a preferred group is characteristic of these individuals. As confidence and experience grow, such people are often viewed as being in their prime, taking leadership roles of various kinds, strategizing and making deals that make things happen in the orbit they have constructed for themselves within the larger system, whatever it is.

In relating with a patron, the individualistic client both supplies the patron with service of some kind (empathy) and demands from the patron an exchange of some kind (ego). The reverse is true for the patron. Later, when that client operates in a patron (or boss) role toward his or her own client(s) (or subordinates), the donned ego role of patron can directly balance the donned empathy role of client the person plays with his or her own patron. The system acts as an external and internal stabilizer as humans meet their diverse needs. The human actors' interactions are the homeostatic regulator in the social system. Finally, the needs of the strongly individualistic person are "weighted" on the ego side of the spectrum *because* the developmental challenge at that stage *is* to strengthen the ego beyond its conventional operations. Yet, as Cory asserts, there are inherent balancing dynamics with empathy, and the foregoing suggest the diverse ways that an individualistic person can perform within a hierarchical system, such as the U.S. Congress, to which this discussion now turns.

The Tribes on the Hill

Weatherford (1985) initially expected that this anthropological study would enable him to do comparative analyses between Congress and such legislatures as Germany's Bundestag, Iceland's Althing, or the then-USSR's Supreme Soviet. He found that modern parliaments had little comparative basis with Congress. Instead, he realized the daily congressional activity was "better explained by the practices" of tribes in Venezuela, the Amazon Basin, or New Guinea, and he "saw more parallels, contrasts, and analogies with the ancient Aztecs, the Byzantines, or the Pygmies" than with those other parliaments he'd hoped to compare (p. xiii). The Congress does not fit a feudal model because the power pyramid is not fixed and stable, but shifts with the results of elections, parties and leaders in power at different times. The veneer of democracy lends itself to masking the institutionalization of nondemocratic practices in the halls of power. Further, climbing the ladder of success and power in Congress is not based on a bureaucratic seniority sequence, but "depends more on the individual initiative, skill, and plain luck of the politician." ... "Yet the hallowed principle of seniority still plays a significant, if not determining, part in the process" (p. 26).

Once a member of Congress has succeeded in the clan-building process, the parent clan sends its offspring into the spaghetti-weave, through the institutions beyond Congress to solidify the political base. Such subclans "enhance the daily operational power of the parent clan on the Hill, but at the same time they offer a long-term insurance against sudden death and destruction to the parent clan in times of political plague" (p. 86). The array of subclans belonging to parents under the roof of Congress "form the network base around which government operates ... [by] crosscutting the formal organization of government departments, political parties, and lobbies" (p. 86). Infiltrating the bureaucracy is a prime objective, and patronage networks facilitate getting subclan staff hired, who gain tenure and power in those civil service roles.

The bureaucracy's pyramids shift in power in ways similar to that of Congress, since congressional big-men reorganize departments when they take over from the previous party or big-man. Also responsible for reorganization are presidential appointees: the President has a total "patronage universe" of about 6,000 positions (Patterson, 1988, as quoted in Freedman, 1994, p. 21). Weatherford's study of the federal bureaucracy led him to the conclusion that the redundancy of bureaucratic operations is attributable to the congressional big-men's fetishes to be patrons of all possibly desired services for their constituencies.

> Even though Congress as a whole and congressmen as a group may exercise very little day-to-day power over the operation of the bureaucracy, individual congressmen do exercise that power through their private bureaucracies, their clans. Each Big Man runs his own separate part of the government as a sovereign, independent chief, but because Big

> Men do not interfere with the clan operations of other Big Men, and because the junior Congress members lack the power to interfere, the Congress as a whole has little means at its disposal to oversee the government. (p. 102)

Nor do congressional big-men want to incur debt to other big-men; the ego pole resists shifting too perilously close to that of a client. Weatherford studied how lobbyists come into use as brokers between big-men and their staffers, and the roles they play as "political surrogates" (p. 122) while big-men remain above the dirty fray. Lobbyists are, therefore, also clients of big-men, particularly when as ex-staffers they become lobbyists, only one of the mechanisms of clientelist politics in the U.S. Congress.

Apexes of Pyramidal Social Structures

From tracing dual motives to and beyond the national Congress level, the next step is to extend the horizon to higher-level institutions, formal and informal. From Mills' (1956) exposition to current events, it is evident that the horizon encompasses and integrates social, political, economic, and military domains, with dual motives' often incestuous relations among their elites via personal and institutional transactions. One cannot study any country's internal and external behaviors without encountering the myriad social systems that reflect dual motives at every scale. Parastatals, national governments, transnational corporations, and international institutions weave the same patterns across the international arena. Public-private partnerships rooted in meeting their parties' dual motives play out in such debacles as the United Nations Oil for Food program, U.S.-Halliburton et al.-Iraq (non)reconstruction, and the disappearance of billions of international development aid monies to governments worldwide. The social, political, and economic power wielded at these scales generally reflects strategic behaviors based on linear, formal logics of the tenth stage of hierarchical complexity.

As indicated in Table 1, formal logics develop from processing one input variable at a time, and arrive at well-justified conclusions based on the logic employed. The limitation of this order of complexity is that agents are unaware that there are multiple input variables to coordinate in any social, political, or economic transaction or decision. Generically, it can be said that the multiple other input variables are invisible at the formal stage, although they are omnipresent conditions in every social system in which transactions take place. As Guastello (2007) suggests, sensitivity to initial conditions influences decision paths and decision-making's results. Behaviors at the tenth order of hierarchical complexity are inherently less sensitive to initial conditions because it requires the next order of complexity, systematic stage reasoning, to develop matrices of relations.

Formal logic, as a structure of reasoning in an individual and as a characteristic of an organized system, reflects a sturdy equilibrium that is difficult to affect or change. The logics, though partial, are experienced as solid, hard-to-refute truths (in individuals) and "best practices" (in organized structures). Thus, there is an institutionalized equilibrium that represents a fundamental challenge for addressing such economic behaviors as corruption. Mills (1956) was convinced that "for every epoch and for every social structure, we must work out an answer to the question of the power of the elite" (p. 23). And to do that, we need to include the entire pyramidal structure on which they depend. From the elite top to the subsistence bottom, sturdy latticeworks of behavioral tensions ensure durable social systems that meet multileveled needs of many actors while ignoring the needs of many others.

Features in Political Economies of Corruption

A complete developmental analysis of political economies of corruption needs to include the intersection of individuals and groups with their institutional arrangements. Institutional arrangements include the stages of development evident in forms of government and other governance entities, political parties, ethnic relations, the formal and informal economies, rural-urban interfaces, historical trajectory, status of education, natural and other resources, influences of international players, e.g., structural adjustment policies—in other words, the meta-system comprised of numerous subsystems. With their emphasis on introducing a developmental application of dual motive theory, the foregoing examples omit discussion of many elements that would be necessary for a complete analysis. The following summary includes key features abstracted from the presented developmental progression of political economies at various stages of hierarchical complexity. It includes additional categories of hierarchical complexity (HC) of form of government and balance between formal/informal economy to flesh out features the examples could not develop (but see Ross & Commons, 2008; Ross, 2005, 2007).

Concrete Stage

Behaviors of social groupings dominated by subsistence concerns tend to be at the concrete stage. Concerns have short time horizons, accordingly. Reciprocal exchanges are concrete goods and services, and their timelines for performance may be immediate or considerably longer to keep the relationship active for future transactions. Leaders are either personally known or known of, and followership is based on patronage ties. Even where formal government has been introduced, its purpose or function is vague. In such cases, specific officials (e.g., a president or minister) essentially “are” the government. Roles are not distinguishable from the individuals who have roles. “Democracy” may mean getting a job, rather than have anything to do with government or elections. If election processes are introduced, the abstract concept of political party is meaningless; voters favor their tribal or ethnic group’s endorsee, their patrons, or their patrons’ patrons. Manual labor in the informal market is customary (agriculture, sewing/weaving, crafts and repairs, machine operation, drugs, arms, and slave trades). Poverty is common in subsistence-based social groupings, as are low levels of education. There are no concepts of formal contracts or title to goods; physical possession equals ownership. Social ties often dictate customers and vertical ties to brokers or patrons are common means to secure a place in the local market. As social complexity increases, people who perform at the concrete-stage tend to remain on the lowest levels (see Figure 1).

Abstract Stage

Leadership roles in concrete-stage social groupings tend to be held by those who can function at the abstract stage, usually due to having some education or native ability. Brokerage functions can be performed at the abstract stage, as can basic clerical tasks. Loyalties to leaders, parties, ethnic groups, and belief systems are strong. It is the norm to identify with and not question the group. There is an ability to manage multiple reciprocal relationships (i.e., a patron and multiple clients; associate with peer elites (a distinct group) even if they are from competing groups). Low level jobs in the formal economy or civil service are common at the abstract stage; labor unions and associations form at this stage. With structure and procedures provided, abstract stage includes loyal bureaucrats and teachers. Reciprocal exchanges are for concrete goods and services, with either immediate or deferred payoffs. In non-Western settings, abstract stage individuals are likely to associate with concrete-stage persons, often their clients, but abstract stage g*roups* are more likely to become an elite class, distanced from concrete-stage groups. Simple abstract concepts become accessible at this stage. For example, the concept of *role* is learned, such that people understand different individuals may fill and later leave the same role (e.g., boss, local priest, teacher, president). Abstract concepts cannot be compared or coordinated, however. Individual rules can be conceived of to accomplish a desired end, but the method to implement the rule cannot be conceived (although punishments for breaking rules come easily). A rule can be explained and followed. But any contradiction with a different rule or norm is not noticed. For example, a bureaucrat may be as faithful to the norm of charging bribes because that is the way things get done everywhere, as to the rule to be honest and give constituents fair and equal service. The legal purposes of government and elections are vague; simple concepts at this stage are "like" concrete things, unsupported assertions characterize speech, and there is no self-reflection.

Formal Stage

Characteristics of formal stage behaviors are apparent in individuals who are competent entrepreneurs and managers; they are more likely to be the population who enter the formal economy in non-Western settings. In Western settings, formal stage behaviors characterize a large majority, but they are minority behaviors in non-Western settings. Western structures of government or business derive from formal logic's reasoning. When they are imported to non-Western countries, there are few formal stage persons to understand how procedures are supposed to work or their underlying logic (e.g., separation of legal powers or separation of administrative duties). The new forms of government or business procedure provide new facades to which conventional behaviors of patronage and clientelism adapt and persist, usually more effectively because access to new resources is available. For example, the formal concept of employees on payroll is used to pass to clients, often as "ghost employees" who do not work for the government or business employer (e.g., see Figure 3). Bureaucracies grow huge when formal institutions and their resources are used "like" the tools of patrons and brokers in servicing clients' needs. Formal logics successfully develop formal roles and responsibilities. It can distinguish between a role in an employment setting, such as financial manager, and roles in non-employment settings (e.g., union member, family member). Because in-group ties are strong, it is often less successful distinguishing employment role from political party role. This is particularly true in the widespread practice of patronistic political appointments, where party loyalty can trump formal role responsibility. Formal stage logic successfully develops rules and methods to enforce them. People who use formal logic are very good at using rules to find or create loopholes that help them implement their strategies. Formal logic's focus on one linear sequence at a time means that it is not successful at foreseeing unintended consequences that are not already evident to it. For example, it is clever at "cooking the books" to hide bribes or the true nature of investments. It can manipulate a developing counties' lack of procedures for checks and balances to funnel cash to brokerage clients, loyal party supporters, and militants to buy services. But it is unable to imagine the perspectives of people who are not in the in-group or foresee the repercussions of actions taken on a wider band of society or the environment—or know why it should care. The tendency to favor the ego-pole in managing behavioral tensions leads to formal stage behaviors that do not coordinate ethics concerns in every self-serving equation. This contributes to double-standard behaviors or rationalizations that judge others for wrong behaviors even when the judge has done likewise. However, formal logic is the origin of concepts of rights, duties, corruption, equal protection, checks and balances, and other foundations that structure modern societies. Formal education through decent secondary schooling is usually the minimum requirement for development of formal stage reasoning.

Systematic Stage

The ability to coordinate multiple disparate relations among factors at this order of hierarchical complexity led to the development of higher level abstract concepts such as transparency, accountability, social justice, and sustainability. While such concepts have entered some mainstream vocabularies, these concepts do not mean the same thing to abstract and formal stage reasoning as they mean at the systematic stage. Systematic reasoning is more likely to develop during graduate school education, if then. It is not wide spread in any society. With respect to corruption, systematic reasoning can consider a combination of such factors as the rule of law, fear of exposure, preservation of image, methods of reporting, and market pressure, for example, to conceive a system of transparency to reduce corrupt practices. Systematic reasoning can also conceive of a system to skirt efforts to enforce transparency. What it cannot do is consider multiple social, economic, and political systems, such as those described in this paper. It can neither succeed in entirely escaping transparency measures nor eliminate efforts to sabotage efforts to institutionalize transparent practices and reduce corruption.

These orders of hierarchical complexity have been summarized separately to distinguish them. However, complex social systems are comprised of individuals operating at several of these stages. Similarly—and a major point in this paper—the social systems themselves reflect concurrent operations of several different orders of complexity. There are no clean-cut divisions but rather many overlapping systems and relationships among different people and entities.

Implications and Conclusion

A major implication for understanding the political economies of corruption is that not only are there multiple kinds of political economies but also that they are interdependent and mutually supportive. Figures 2 and 3 are fair representations of the most prevalent social network structures operating around the world, for the most part needing adjustments only for the names of roles and entities and to show the multiple additional such structures operating simultaneously. *Corrupt* practices, by definition, emerge in a society only when a rule of law has been adopted that identifies them as law-breaking. Passage of a law does not change the hierarchy of needs experienced by a society’s members. Passage of a law does not dismantle the time-tested social systems for meeting those needs. Patron, broker, and client roles are embedded in social systems at each of the orders of hierarchical complexity described above because they serve essential roles in meeting needs along the entire spectrum of ego-empathy motives. As societies develop, patron and broker roles are performed by corporate employers and governments for some of the population, and by individuals and groups for others in the population. Complex mixtures of social arrangements that adapt with changing conditions are the norm.

Individuals and institutions across the planet have been dedicated to "fighting" the corruption that attends human interactions from local police behavior to transactions within international corporations and development funders. For many, corruption is a starting point and the presenting problem, and there are numerous justifications for that. I suggest a prerequisite for addressing corruption is a grasp of its underlying developmentally-different social structures, which perform patron, broker, and client roles, and the larger social, economic, and political contexts that support them. The ethics and repercussions of destroying a social system without replacing its functions need to be seriously examined.

Societies at different stages of development have different apexes of power that correspond to their social, economic, and political structures. Much of the corruption literature suggests that efforts based on some of their assumptions may prove to be as destabilizing and inappropriate in many of the same ways as democratization efforts are (Ross, 2007). Rose-Ackerman (1999) however, has a keen insight into the dynamics that are predictably inevitable when mis-matched institutions are introduced. She writes "societies based on strong interpersonal relations may have little notion of formal agency-principal relations and the obligations they impose on agents. The idea…may seem strange and unnatural…. The introduction of new institutions that fit poorly with underlying norms can produce pathologies…." (pp. 106-107). From the developmental perspective introduced here, it may be seen that the ideas and practices of formal stage institutions will not only seem strange and unnatural but that they will not even "compute" to concrete and abstract stage social systems and actors. Her explanation includes how and why such policies actually increase the undesired "corrupt" behavior, and it is related to a premise of this paper: social systems arise organically to meet otherwise unmet needs. Komito's *Whose man are you?* and *It is impossible not to be somebody's man* should be internal mantras in every analysis so entire networks are recognized. Powell (1977) views the understanding of clientelist politics as having "profound importance" as "an heuristic device for the understanding of a wide range of political behavior which political scientists, in the main, consider to be either pathological, deviant, or of minor import" (p. 147). Understanding this device, Scott's (2002) phases of transition dynamics suggests the kinds of gradual, planned shifts in relational ties that need to be provided at all levels. Most often, attention placed on corruption starts at the wrong end of the system, the patron-laden apex, and new instabilities and social and economic costs result. The entire complex—social, economic, and political systems, the functions and roles they perform, and dual motives of the actors that perform them throughout the horizontal and vertical latticeworks—needs to be addressed as the stable, coherent whole that it is.

Anomie is a useful concept in connection with systemic change efforts. The dictionary defines this as the social instability that results from a breakdown of—or, I would add, a radical change in—standards and values, and also as the personal unrest, alienation, and/or uncertainty that can result from a lack of purpose or ideals. Poorly conceived interventions can, and do, all too easily destroy solid social systems that reflect those often taken for granted social glues of meeting diverse needs. Radical, non-indigenous change tends to catalyze social instability (e.g., structural adjustment policies, outlawing the Baath party in Iraq, imposing or importing Western models and requirements).

This developmental behavioral analysis of dual motives' role in political economies of corruption indicates that the roots of corruption lie in both the bioneurological architecture of humans' functioning and the social systems developed to balance behavioral tensions in the process of meeting evolving needs. The bioneurological basis of dual motives shaping society, politics, and economics is supported throughout this analysis. The trajectory of social systems' development presented here indicates that political economy is mostly synonymous with the term, social system. The reciprocal relationships that characterize what we call corruption are clearly deeply rooted in humans' social nature and survival as a species. The reciprocity complex explained by dual motive theory is very much in evidence once there is a systematic method to recognize the guises and systemic dynamics through which it manifests. The model of hierarchical complexity provides such a method.

Because humans are living, whole systems, their behaviors, and therefore psychology, are intimately and inherently related to their bioneurological architecture. It will require new methods to adequately address needs of diverse people who populate entire social systems via comprehensive alternative systems before new norms of behavior and more complex behaviors are developed widely. Failing that level of ingenuity, it is unlikely that policies will cut short the life of the institution of corruption in our lifetimes.

A Brief Overview of Developmental Theory, or What I Learned in the FOLA Course

Jonathan Reams[1]

Abstract: This article describes the history and development of developmental theory from a lay person perspective. It covers some of the main strands of how developmental theory has grown, focusing on ego stage theories and dynamic skill theory as the main examples of soft and hard stage models. It also touches on how measures of these models relate to the theories. Reflections on the relative merits of each strand are considered, as well as implications for broadening the scope of awareness of developmental theory among the larger population of integrally informed practitioners.

Keywords: Developmental theory, dynamic skill theory, ego development, metrics.

Introduction

I was first exposed to developmental theory in 1996, in a course on leadership and imagination in the master in organizational leadership program I took at Gonzaga University, where we read Hall and Thompson's (1980) *Leadership Through Values.* Fast forward 17 years, and in the fall of 2013 I took the Foundations of Lectical Assessment (FOLA) course from Lectica.[2] Up until this time my range of knowledge about developmental theory had been primarily shaped by my exposure to Wilber's *Integral Psychology* (2000) and likes of Kegan, Torbert, Cook-Greuter and such. While I had examined the eleven pages of comparative tables Wilber did to show the range of work in the field, I had not looked into many of them with any seriousness. The FOLA course expanded my range of familiarity and exposure to developmental theory and theorists, and deepened my appreciation for the complexity and nuances alive in the field.

In this article my aim is to give a lay person's overview of what I now consider to be salient points along the history of developmental theory. In a sense, I will construct a story, based on my sorting and sifting through the myriad of material available to draw on, selected according to my sense of what will paint a sufficiently accurate and informative tale for a range of readers who might benefit from it.[3] While this aspect provides the bulk of what I will describe here, I also wish to use this opportunity to offer some perspectives on what I consider to be important questions to consider in the sometimes problematic use of developmental theories in a more casual manner. I also aim to offer some views on how the various approaches to development might be utilized to give a more comprehensive picture of human experience.

The Roots of Developmental Theory

To understand how and why developmental theory has come to the place it has, it can be useful to review the historical context from which the current diversity has grown. What we will soon see is that the developmental view has deep roots in psychology. It has evolved from a theoretical basis, through early work to develop an understanding of the processes involved in development and methods for its study, to a rich and diverse set of empirically grounded models and metrics for supporting how we can look at human experience.

Baldwin

While many look to Freud as the father of modern psychology, concurrently in America people like William James, John Dewey and James Mark Baldwin were also developing foundational ideas that would have a major influence on the field's development. In particular, Baldwin's (1895, 1906) ideas were seminal in how development was understood and his works have had wide ranging impact, most notably by heavily influencing the works of Piaget and Vygotsky. Although he is a relatively unknown figure today, an examination of Baldwin's work can help us see the deep roots that a developmental approach has in the field of psychology.

---

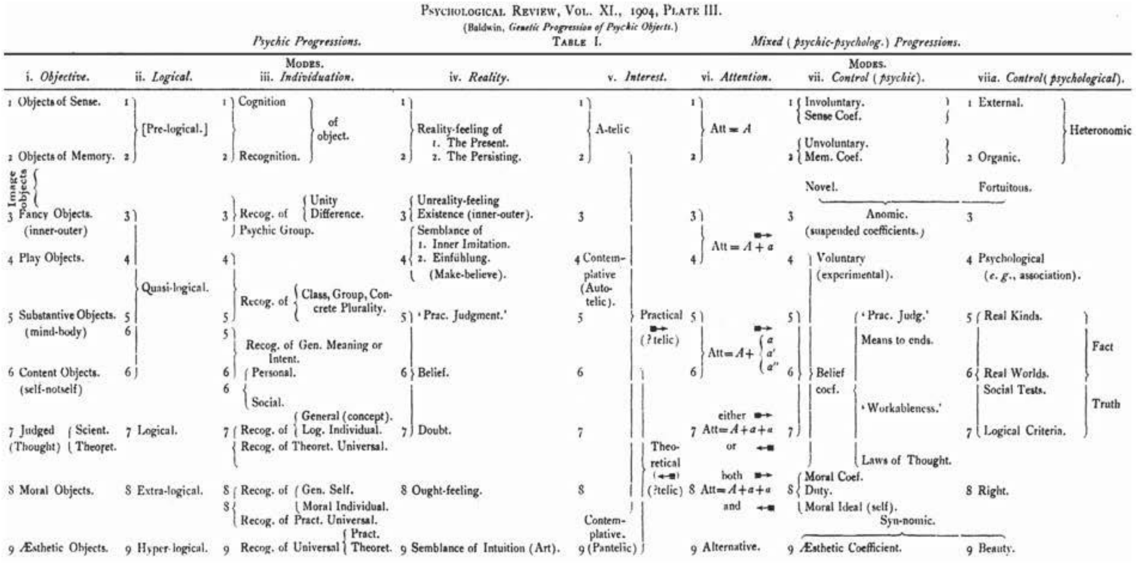
[2] This course is the main introduction and orientation to the work of Lectica, whose mission is to change the way testing is done in education. It was taught by Zak Stein, with support from Zachary Van Rossum, online using pre-recorded video lectures and asynchronous video meeting technology for class discussions. It contained a significant body of literature as the foundation for the curriculum. The majority of this article is drawn from that literature, with additional material for some sections.

[3] I would like to express my gratitude for the significant feedback I received from Thomas Jordan, Zakary Stein and Theo Dawson. They helped clear up a number of details and misunderstandings I had along the way, and added valuable insights that furthered my learning. Remaining mistakes are my own.

Baldwin taught psychology at Princeton (1893-1903) and John Hopkins (1903-1908), served as president of the American Psychological Association (1897), and was co-founder of the journal Psychological Review in 1894. When a scandal forced him to move to Paris in 1908, editorship of the journal went to John B. Watson, who shifted the focus from developmental psychology to behaviorism, driving developmental perspectives underground for decades.

While in Paris (until his death in 1934) he influenced the young Piaget, and the marks of this influence are clear in Piaget's work. He also shared a more dynamic process-oriented view of stage development with Alfred Binet. Another example of his influence can be found in how his concept of imitation evolved into Albert Bandura's concept of modeling.

In terms of his ideas, he had a very specific stage model of development (see figure 1) and used the concept of "subject object theory" explicitly (long before Kegan's use of it, which is much more familiar today). His stage model broke from reductionistic views at that time. It was influenced by evolutionary biology and took an organismic approach to development, using the term genetic epistemology to indicate the *genesis*, or developmental orientation. He also showed how apparent foundational acts can be more basic steps and stages that have gone through their own developmental process. Baldwin also moved away from the contemporary convention of judging child/infant consciousness purely from the vantage point of adult consciousness. The complexity and foresight of Baldwin's conception of stages of development is shown in this table from an article he published in 1904.



Psychological Review, Vol. XI., 1904, Plate III.

Figure 1. Table of developmental stages from Baldwin (1904).[4]

---

[4] This table can best be understood by thinking of it in a similar manner to Wilber's (2000) tables in Integral Psychology. Here, given that there were not other researchers and theorists in the field to

Piaget

We can see that the core ideas of developmental psychology were laid out by Baldwin over 100 years ago. What remained was to find a way to apply an appropriate method for research in this area. Thus we move on to Piaget (1932, 1954, 1970) who, influenced by Baldwin's ideas of stage development, took up research on ideas about genetic epistemology. He was inspired by working with Binet on intelligence testing, and adapted Freud's use of clinical interviews in psychoanalysis to develop the method of semi-structured interviews to study how epistemological structures evolved. Thus his unit of analysis was epistemic structures, not individuals. What he actually did to apply this was to talk to kids about playing marbles.

> Piaget demonstrated how to look for and discover the structural properties of linguistic performances that are indicative of development. … [T]he radical innovation here was the careful and systematic classification of performances in terms of their developmental level. Piaget … built a hierarchical taxonomy of cognitive-structure types for classificatory purposes. (Stein & Heikkinen, 2009, p. 11)

Observations of how young boys in his town in Switzerland played the game of marbles (and hide and seek among girls) provided the setting for examining how epistemological reasoning develops. As an example, I will examine how Piaget began to make distinctions between how children adapt to or practice rules, and how they become conscious of them. For Piaget practice began at the stage of motor skills, with children repetitively going over certain actions to learn specific motor skills. This motor skill practice led to the adoption of habits that are quickly made into schemas and reproduced as a "game." This egocentric practice comes from receiving rules from the outside (parent, older kids) that the child imitates while still playing alone, even if in the presence of others. The next step is cooperation, where some mutuality, with awareness and consideration of others entering the picture. This is eventually followed by the codification of rules, with mutuality engaged more in discussing the rules than the actual motor skills of playing marbles. Breaches of the rules were considered to be in the domain of application rather than about the rules themselves.

While Piaget's focus on development was around its processes, he also described stages he observed. For example, he identified three stages for how consciousness of rules develops. Rules start as unconscious in the first stage. They then become sacred, received from external or transcendent sources. In the third stage, they arise from mutual consent. He explored the movement from concrete reasoning to more subjective and principled reasoning, as well as the movement from obeying external authority to notions of fairness and justice among peers. Understanding these processes led to the creation of learning sequences. The core processes derived from these observations were; assimilation, accommodation, equilibration and reflective abstraction.

In the end, Piaget actually contributed much more about the process of the development of epistemological structures than the stages of child development he is so well known for. What

---

compare, Baldwin laid out what he perceived as the various facets of development and how they related across stages.

Piaget considered as the "American problem," had to do with Americans' focus on the stages themselves, and a fascination with finding how to speed up progression through the stages.[5] This focus on stages did however help to lay foundations for pedagogical sequences in K-12 contexts in America. Yet in reality, stages for Piaget were only symptoms. His deeper interests were in the processes that enabled epistemological structures to develop.

Transition to the Neo-Piagetian World: The Development of Diverse Streams of Thought

As various people picked up Piaget's work, diverse approaches and strands of developmental theory began to appear. These were also the result of researchers being influenced by a variety of themes going on in psychology at any given time. Subsequently, more recent researchers have taken up different threads and mixed them in different ways. From this the trails of influence on research become broader and more diverse, leading to a less fixed and direct sense of lineage from one researcher to the next. It is not possible in the scope and context of this article to attempt to do justice to all of these strands. What I will do is follow the development of some of the players in what I consider to be two main strands which can be described as Neo-Piagetian, in that they build in various ways upon Piaget and Baldwin's seminal work.

The directions these different strands followed has led to what has been loosely characterized as "soft" and "hard" stage models of development. Another descriptive distinction could be between ego development theories, domain specific theories, and domain general theories. Ego development theories have roots in the work of Jane Loevinger (who built upon the work of Harry Stack Sullivan), and is built upon by Robert Kegan and Susanne Cook-Greuter among others. These models contribute significantly to our self-understanding, or how we function as a self. The second strand of hard, or domain specific theories, follows from Kohlberg and the work of a number of students and researchers he influenced. This will also lead us to examining the notion of a common core metric and model of development that shows how all the domain specific research on development is actually based on a common core structure of development. As well, there are what Lawrence Kohlberg termed functional stage models from Erik Erikson and Harry Stack Sullivan that have been influential in the field. I will address these briefly even though they are not "developmental" in a strict sense.[6]

What we can see upon first glance is that ego stage models tend towards describing a center of gravity, a structure of self-understanding and meaning making that is relatively stable with periodic transformations, and within which variability happens, but is harder to account for. Fischer's dynamic skill theory, on the other hand, starts from two different sets of empirical findings. One is that variability is central to performance, understanding etc. and that this variability is both moment to moment within an individual and across individuals.[7] Thus statistical norming or establishing a center of gravity is not in focus. The other is that the unit of analysis is the skill being performed and the hierarchical complexity of it, not an individual ego and its stage of development. Individuals are simply the means through which we can observe these structures.

---

[5] Evidence of this focus can be seen in the current Wilberian integral community's near obsession with accelerating processes of development, especially to so called "second tier" or integral stages.

[6] This use of the term *functional* stage models is derived from Kohlberg et al.'s (1984) review of the current (at that time) state of the field. In the FOLA course, these were described simply as soft and hard stage models. Erikson was seen to meet some of the stage criteria in a soft way, and Sullivan was a direct influence on Loevinger. This is discussed more later in this article.

Context of the Transition

As I examined the larger context behind how the field has evolved, I came across writing by Robbie Case (1987a), who noted that conceptions of stages and structures had come under intense scrutiny, critique and disfavor in academic discourse and research, especially in North America in the period after Piaget's initial influence. As a new generation of Neo-Piagetian researchers took up the task of rehabilitating developmental understandings of psychology, they attempted to address a number of issues (noted below) arising from these critiques.

Case (1987b) also deeply analyzed the deeper historical roots and trajectories of three major intellectual traditions that have influenced the study of development in psychology; empiricist (coming from Locke and Hume), rationalist (coming from Kant) and historico-cultural (coming from Goethe, Hegel and Marx). The empiricist influence is seen most clearly in behaviorist and neo-behaviorist theories of learning, as well as information processing theories. They share epistemological assumptions that lead to a view of learning and development as essentially equivalent. The rationalist tradition encompasses assumptions about intellectual development as being rooted in how order is generated from structures that children come equipped with and that change with age. (Case notes that Baldwin and Piaget are in this category). The historico-cultural tradition emphasizes the unique cultural circumstances of a social group and how knowledge acquisition is grounded in these circumstances and the tools developed for coping with them. (Vygotsky is an example here).

In this context, Case (1987a) has also presented an overview of the specific challenges facing Neo-Piagetian research in sorting out what was essential to retain from Piaget's work and how to best move the field forward. It was commonly accepted that the strength worth keeping was the theories' ability to explain what were considered as universal structural features of cognitive development. This can be seen in the eventual discovery and description of common core structures that can be measured with great accuracy. Specifically, Case listed general agreement around there being three or four structural levels, that the higher levels include the lower ones, and that there is a characteristic age range for the acquisition of these levels. It was also agreed that there is a cyclical recursion of sublevels within each level. As the further research of neo-Piagetians was included, Case observed agreement around domain specificity in the rate and content of structural growth, the presence of inter- and intra-individual differences (variability) and the discovery of a wide range of domains of application of developmental models.

What were considered not worth keeping were the aspects that were not universal. This led to "more dissimilarities among the new theories than there are similarities" (Case, 1987a, p. 773). These can be summarized as questions about what the criteria are for distinguishing stages and how to distinguish sub-stages from them, as well as the nature of the basic structural units (i.e. are they schemes, skills, conceptual frameworks etc.).

---

[7] Piaget and Kohlberg both explicitly denied variability.

As well, there were areas of agreement and disagreement around the transformational processes involved in development. Agreement focused around each structure being assembled independently, the importance of cultural and environmental factors in the process, and common constraints imposed by working memory. Disagreement centered around identifying the process which produces long term structural changes and the processes which produce changes in processing capacity. This divergence has manifested in the numerous domain specific models and metrics of development. I will now turn to examining some distinctions among these strands.

An Examination of Stage Criteria: Functional, Soft and Hard Stages

Above I noted different strands being distinguished according to criteria for functional, soft and hard stage models. In this section I will examine how these distinctions arose. In particular, I will draw on Kohlberg, Levine, and Hewer (1984), who set out to address a number of criticisms of Kohlberg's work and in this process engaged in clarification of criteria for what constitutes a stage model. They talk about a "differentiation between 'soft' developmental models of social and moral reflection and 'hard' Piagetian operative stages of reasoning" (p. 212). There is also a third distinction they make of functional stages, which is outside of the main focus of our discussion here but worth mentioning.

Four general criteria, coming from Piaget, have been used to classify the range of developmental models, with the functional stage models meeting the fewest criteria, and the hard stage models meeting all of them to qualify. The soft stage models are then seen as somewhere in the middle of this continuum. The first criterion is that models display a qualitative difference in the structures being used. The second criterion is that these structures have an invariant sequence. Third is that they form a structural whole, or an underlying organization of thought. The fourth criterion is that these stages are hierarchical integrations, taking in previous stages while also increasing differentiation.

Thus the stages laid out by Erikson (1982) and Sullivan (1968) do not meet these criteria in that they are; culturally relative, not strictly hierarchical, and organized around responses to typical life situations at different ages in western culture. In this way they are at one end of the spectrum of developmental models. They do have stages[8] but the way these stages are constructed, as noted above, mean that their focus is not on the same level of rigor around these criteria. This does not mean that they do not have value or influence, as we have seen, just that if we wish to look deeply into the core structures of human development, we need to turn our attention to the latter two distinctions.

---

[8] I am mindful that the term stages is a broad one, most often used in casual discourse with assumed common meaning. Within this literature various theorists use the term in much more specific and varied ways. I have chosen not to get into the work of making my own definition of the term, as that would go beyond the scope and intentions of this article. I recommend readers simply be aware not to project assumed meaning into this and other terms like structure, cognition etc. I do however go into more detail around these terms in relation to some of the theorists covered.

Kohlberg et al. (1984), in their discussion of the current formulation of the theory (as of the time of writing in 1984), noted that there were many areas of agreement between their primary examples of soft and hard stages; that is, Loevinger and Kohlberg. These were noted as; claims for structured wholeness, invariant sequence and hierarchical integration. Yet a closer examination revealed important differences.

This entailed going deeper into specific definitions and distinctions around how stages are conceived and understood. “For Piaget (1970), a structure is a system of transformational laws that organize and govern reasoning operations. This formalized governing system is reflected or manifested in individuals' actual responses to conflicts or problems” (Kohlberg et al., p. 242). In addition, there is a need to add distinctions between content and structure, as well as competency and performance, in order to use the Kohlberg’s scoring methodology in identifying structures.

Kohlberg et al. (1984) described how they perceived a number of these issues. “Loevinger's scheme considers structure less as a form of thinking and more in terms of fairly stable personality functions and contents” (p. 242). Structure is hypothetically derived as an underlying construct, inferred from signs taken from the categories of content in the sentence completion data, which are mixtures of content with structure. Looked at this way, the classifications for each stage are an ideal type based on the theoretical representation of the stage. “Loevinger defines her stages partly in terms of structures, but also partly in terms of functions and motives pertaining to the whole self and its enhancement and defense” (p. 243). Thus while soft stages like Loevinger’s do appear to have stages with qualitatively different organizations, they are arrived at by a more indirect means. They note that while soft stages also have Piagetian structural qualities, they also include “elements of affective or reflective characteristics of persons” (p. 237). Soft stages are also characterized as existential or self-reflective stages involving an ego making meaning for and about itself. This self is a kind of totality; a system of meaning and characteristics that then encounters and engages the world outside itself, including other egos.

In contrast to these holistic models of the self, the hard stage approach requires the division into discrete domains of what self or ego experiences as unified within itself (such as acquisition of specific physical, emotional or cognitive skills). “What hard structures gain by this is precision in their articulation of a structural logic of stages that will survive the ever changing growth of psychological knowledge about the self, its functions and its development” (Kohlberg et al., 1984, p. 238). In addition, they “define structures in a way consistent with the Piagetian construction of structure, that is, as an organization of manifest thought operations” (p. 244). Thus hard stages are considered to relate to empirically observable and measurable actions in direct ways.

Another difference between soft and hard stages worth discussing is one of normativity.[9] This arises from examining how each approach deals with the criterion of hierarchical integration.

---

[9] The use of the term normativity here is related to the distinction between describing what is, or saying what ought to be. The nuances of this distinction are beyond the scope of this article. It is however interesting to note that Kohlberg’s sense of what the endpoint of moral development should be can be seen as the genesis of the “growth to goodness” issue I comment on in my concluding reflections. (Dawson, personal correspondence, March 2, 2014).

The criterion requires each new stage to transform the functioning of the previous stage. This invokes a normative end point "based on a conception of human rationality" (Kohlberg et al., p. 246) where "each stage in the hierarchy represents an increase in correspondence with the end point or highest stage" (p. 246). Piaget and Kohlberg both have this normative conception in how the stages develop.

In contrast, Loevinger is clear that she does not claim any normativity in her model of ego stages. Each stage is seen to add new aspects to the previous stage which makes for a more cumulative model than a transformational one, and she does not claim that higher or later stages are necessarily better. "Soft stage development depends neither on the emergence of new functions nor on the performance of new tasks. Instead, soft stage development depends on formal reflection" (Kohlberg et al., p. 249). Thus the differences in this point can be seen to impact how stages are seen to evolve.

For all of the debate and fine grained distinctions that went on in the above analysis of distinctions between soft and hard stage models, one of the reflections arising from this was to see a possible need to go beyond Piaget when it comes to adult development, and grant value to the soft stage, or ego development models.

> The strict Piagetian stage construction may need to be abandoned in the study of adult development, but the idea of soft stages of development in adulthood should not be. … Soft stage models present a new way of doing research in the subject area of adult development, a way that has emerged from the Piagetian paradigm. (Kohlberg et al., p. 249)

This quote points to the need to find good ways to integrate the findings of both soft and hard stage models.[10]

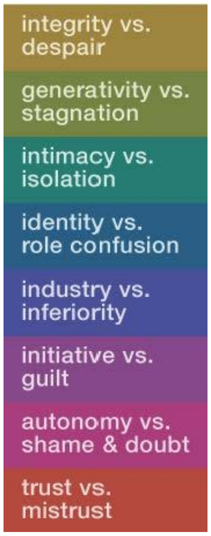
Following the above work to lay out the distinctions that emerged in the early post-Piagetian era, I will now lay out brief descriptions of exemplars of the functional, soft and hard models. I will start with the work of Erikson and Sullivan, describe aspects of Loevinger's work, and finally move on to Kohlberg's work.

Functional Models: Erikson and Sullivan

Erik Erickson's (1982) developmental model has had a very visible influence on the field of psychology with his life span stages and the identity development and crises associated with them. These are "functional stages" according to Kohlberg's criteria, and are focused on a psychodynamic view of the self-system. The idea is that the self-system navigates its way through a series of crises resulting from the interface between the personality and socio-cultural environment. As each crisis is passed or resolved, (there can be different levels of "success" in terms of how well these are resolved and implications for how the next and subsequent stages play out based on that), a new stage of ego development appears that is considered to be more mature and have a more complex and integrated self-system. The following figure illustrates Erikson's stages.

---

[10] While making fine distinctions has a utility in terms of clarification of issues in the field, it can also distract and divide us into favorite theoretical camps. In the end, I find this to be of less use than finding ways to integrate theory and research for the sake of better applications and methods for supporting healthy development.



"Is it OK to have been me?" (65-death)

"Can I make my life count?" (25-64)

"Can I love?" (20-24)

"Who am I? What can I become?" (13-19)

"Can I make it in the world of people and things?" (5-12)

"Is it okay for me to do, move, and act?" (4-5)

"is it OK to be me?" (2-4)

"Can I trust the world?" (0-2)

Figure 2. Erikson's stages of development. From Stein (2012). Used with permission.

This model of stages meets some of Kohlberg's criteria for a stage model in that factors such as transcend and include are there, (mostly through his way of talking about how later stages go back and revisit or re-conceptualize the issues of the earlier stages) and that sequentialness is explicit. It also appears that Erikson is viewing cognitive development from a psychosocial dynamic lens.

Harry Stack Sullivan (1968) was one of the neo-Freudians who worked from a psychodynamic framework to develop a better understanding of the individual as being based in a network of relationships. The notion of a self-system was central to his work. This self-system was seen to develop through factors such as social relationships, the psychodynamics of need satisfaction and motivation, and emotional self-regulation in social-cultural and biological contexts. Sullivan's work on interpersonal relationships became the foundation of interpersonal psychoanalysis, a school of psychoanalytic theory and treatment that stresses the detailed exploration of the nuances of patients' patterns of interacting with others. Sullivan proposed four levels of interpersonal maturity and integration; impulsive, conformist, conscientious, and autonomous.

While he published very little, (a series of lectures he gave was posthumously edited to capture the essential content of his work), his influence was significant. Jane Loevinger, Abraham Maslow, Ken Wilber and Kurt Fischer all drew on his ideas in the development of their thinking.

Soft Models: Loevinger

Jane Loevinger (1976) began her academic career by doing research on women's experiences in the post-world war two period in America, becoming one of the first psychologists to focus on the problems facing women and mothers. Her early work in women's attitudes towards family produced results that resisted analysis by traditional methods. Loevinger then drew on Sullivan's (1968) description of levels of interpersonal maturity. She moved into the area of ego development, where she built upon Sullivan's four stage model to create a more nuanced model including eight sequential stages, each of which represents a progressively more complex way of perceiving oneself in relation to the world. In contrast to her predecessors, Loevinger relied heavily on psychometric modeling in the definition and validation of these levels.

Loevinger's model of ego development describes personality in terms of cognitive, affective and behavioral components. It "assumes that all human beings evolve toward greater complexity, coherence and integration" (Cook-Greuter, 1999, p. 33). Ego is considered not as a function or thing, but as a process; "the organizing or synthetic function is not just another thing the ego does, it is what the ego is" (Loevinger, 1976, p. 5). Ego development is seen to represent the development of "structures" in the cognitive developmental sense of "an inner logic to the stages and their sequence" (p. 11). Further, "it is a process, a *structure, social* in origin, functioning as a *whole*, and guided by *purpose* and *meaning*" (p. 67. Italics in the original). The essence of ego development "is the search for coherent meaning in experience" (Loevinger & Wessler, 1970, p. 8)

Loevinger's (1976) model of ego development was grounded in her creation of a method for measuring differences in how people respond to a set of sentence stems. The tool she created for her work on measuring ego development was the Washington University Sentence Completion Test (WUSCT) (Hy & Loevinger, 1996; Loevinger & Wessler, 1970). Loevinger used a bootstrapping method (as described by Kohlberg) for iteratively developing a method for scoring data and building a theory in parallel. The assessment instrument enabled her and other researchers to empirically identify and validate these stages. Stein & Heikkinen (2009) note that Loevinger "aimed to devise a metric for looking at ego-development. Specifically, she was looking to build a calibrated measure. By merging quantitative methods with qualitative ones and adhering to strict psychometric parameters, she constructed a scale of sentence-stem response-types" (p. 9). The terms Loevinger gave to the stages were; pre-social, impulsive, self-protective, conformist, conscientious-conformist (later changed to self-aware), conscientious, individualistic, and autonomous and integrated.

The WUSCT uses written linguistic performance based on responses to 36 sentence stems. Shifts in this kind of performance are noted as something that people can intuitively order or rank along a developmental continuum. Cook-Greuter (1999) notes that the WUSCT "measures performance, unlike Kohlberg's instrument, which indicates competence" (p. 25). She also comments on the use of language in these assessments. "The centrality of language or 'verbal behavior' as a medium through which we manifest our conception of reality is the basis of any verbal projective test" (p. 26). The issue with language as a means for assessment of cognitive functioning is noted by Cook-Greuter (1999) as having to do with such assessments being "heavily derived from empirical evidence and based on a probabilistic rationale for data [which] is prone to specific problems. It cannot account for data that come from the extremes of the scale (lack of evidence) or are ‘novel’ in other ways” (p. 29).

Criticism over this approach has focused on two main areas. One is this dependence on linguistic articulation as the only means of being able to assess an individual with this measure. In addition, it is a written response, not allowing for inquiry and clarification of meaning that other forms of assessment enable. A second critique has been one that is in common with critiques of Kohlberg and other researchers’ work; that it confuses content with structure. (This issue will be explored more fully later on). There has also been criticism about the lack of a logic that can explain why one stage is higher or more mature than another.

From looking at Loevinger’s ego development model we take away some key points. One is that personality structures can evolve[11] (Dweck, 2011; Dweck, Chiu, & Hong, 1995) and that this is affected by social dimensions. Emotion and how it motivates learning also evolves in ways that have pedagogical impact. Thus unresolved personality issues from earlier stages can impact how we relate to environments designed for learning. The implication of this is the need to create safe holding environments (McClure, 2005; Winnicott, 1965) and support through scaffolding for dealing with emotional issues.

Hard Models: Kohlberg

Lawrence Kohlberg (1975, 1984) integrated Piaget’s developmental stage model with philosopher John Rawls’ (1971) work in moral philosophy, building on Piaget’s methodology to bring more rigor in assessing the domain of moral development. “Kohlberg’s fusion of Piaget and Rawls excited many researchers because of its interdisciplinary approach” (Rest, Narvaez, Thoma, & Bebeau, 2000, p. 381). He used Piaget’s two stage notion of moral development (heteronomous and autonomous) and refined it, developing a model of moral development with six stages that has been extensively tested across cultures.

Kohlberg also identified the gap between reasoning and action along with multiple sources or factors influencing it. He examined the relations between cognition, affect and conduct in social development, thus broadening the scope of influences on moral development (compared to how moral development had been examined previously). This led him to propose that cognitive development is necessary but not sufficient for moral development, and to explore ways in which cognitive and moral development relate. His theoretical perspective can be described as phenomenalistic, structuralistic and constructivist.

One of Kohlberg’s major contributions was to take Piaget’s methodology and his notion of stages, and adapt them to develop a systematic methodology for scoring stages of moral judgment. The evolution of the scoring manual, from the 1958 first edition which focused on

---

[11] There is still debate over this point. There is significant evidence that for the majority of people, ego structures do not evolve after reaching adulthood in their mid-twenties. Yet adult cognitive development theory is based on a body of evidence that for some adults, these ego structures do evolve. This leads some theorists to believe that it is possible for everyone to develop into later stages, yet how much of this development is due to favorable circumstances such as intentional support, or to some latent or even inheritable characteristics is as yet unknown. (Jordan, personal correspondence, February 16, 2014).

"holding together all normative content by stage and inferring structure as an ideal type from this content" (Kohlberg et al., 1984, p. 245), through two iterations, led to a system where form and norms are differentiated to better distinguish between content and structure (Kohlberg et al., 1984).[12] Issues are understood as mostly external and moral values. Elements are principled reasons for these moral judgments. The manual also distinguishes between modal and value elements. Modal elements affirm norms without deeper reasoning. Value elements are final justifications of such modalities. Kohlberg began to make better distinctions (that evolved through the iterations of his scoring manual) between content and structure. He did longitudinal studies (with notable limitations in his sample) and did Piagetian style interviews around specific moral dilemmas with standard probes. While for Piaget stages were secondary to his focus on process, Kohlberg made stages important through the codification of what a stage meant. His stages came in three basic categories (with two levels within each category), pre-conventional, conventional and post-conventional.

Pedagogical implications of Kohlberg's work included recognizing the need to pay attention to the structure and environment as well as the moral atmosphere of educational environments. From Dewey (1997) he also highlighted the need to combine action or experience and reflection. He had a good deal of involvement in various educational experiments to implement his ideas. Kohlberg's influence was tremendous, with his stages of moral development entering into use or conversation in schools, prisons, the military and even politics. His students rank among the most influential neo-Piagetian, who together, building on Kohlberg's work, helped to build much more robust understandings of development (e.g. Selman, Armon, Gilligan, Case, Fowler, Commons, Fischer).

Later Neo-Piagetians

The above description of the works of Kohlberg and Loevinger can be considered as the early neo-Piagetians, building on Piaget's seminal research and extending it in various directions. Also coming out of this milieu were a number of other researchers who have carried on work in this tradition. In the following section, I will give a brief mention to a few of the many researchers contributing to the expansion of Neo-Piagetian developmental research.

William Perry (1970, 1981) made extensive studies of epistemological growth in college students that generated a stage model that went from absolutist perspectives of truth being a form of right or wrong, to relativist perspectives where conflicting versions of "truth" can be seen to represent legitimate alternatives and a nuanced perspective of right and wrong. In a way similar to how Loevinger began her research, Perry's original intent was "a purely descriptive formulation of students' experience," rather than a "prescriptive program intended to 'get' students to develop" (Perry, 1981, p. 107). His work has been further extended in the domain of student services work by Marcia Baxter Magolda (1999, 2001, 2009) who focused on how educational environments and experiences could be conducive to growth into self-authoring epistemologies.

---

[12] An important point to make about the manual is that although Kohlberg claimed his system captured structure, his manual requires, to at least some extent, a concept matching strategy, which is problematic because of the limited nature of the construction sample used to create the manual (Dawson, personal communication, March 2, 2014).

A student of Kohlberg, Cheryl Armon (1984) wrote her dissertation on *Ideas of the Good Life: A Longitudinal/Cross-Sectional Study of Evaluating Reasoning in Children and Adults.* In this research she was able to apply the Piagetian standards for structural stage models to evaluative reasoning about notions of the good life. She developed a scoring manual for this domain which, like Kohlberg's, distinguished between structure and content. Her participants ranged from 5-72 years of age, and correlations between stages and age were found to be strong among children and less so among adults.

Later research on moral development in adults (Armon & Dawson, 1997) helped to confirm and extend the focus of Kohlberg's work further into adulthood. Armon (1998) also used a training intervention to close a gap that was found between levels of reasoning and active engagement with social issues. In this, the "emphases on intense affective experience and personal relationships took precedence over enhanced justice reasoning per se" (p. 345). This points to the importance of emotion in learning and development, which will be addressed later.

Robert Selman has conducted extensive research on social role taking (Selman & Byrne, 1974). He focused on this in relation to Kohlberg's work on the development of moral judgment in children (Selman, 1971a) and to role taking in early childhood, where he identified a significant correlation between levels of role taking and age, linking it to stages of socio-cognitive skill in role taking (Selman, 1971b). Reflections from his research led Selman to describe something I found important about the nature of the research process in the field of human development.[13]

> The process of discovery is particularly exciting in the field of personality development. Anyone who works in this field learns not only about the phenomena at hand but about the self. Seldom, however, does theoretical work in this area spring from new discovery. It is more often rediscovery, gaining insight into what others may already know, but which one must discover for oneself. (Selman, 1993, p. 49)

Rest (1973, 1980; Rest et al., 2000) modified Kohlberg's approach, using ideas like schema theory from cognitive science to develop a model of moral schemas that could address many of the criticisms of Kohlberg's work. He took a more flexible notion of stage with development seen as "a matter of changes in the frequency of usage, moving from the less to the more complex" (Rest et al., 2000, p. 384).

Carol Gilligan (2005a) is most famous for her work investigating how moral issues are experienced by girls and women. Her (1982) *In a Different Voice: Psychological Theory and Women's Development* generated a strong feminist paradigm shift in understanding how female development proceeds. While her work critiques many aspects of existing developmental theories, based on their use of primarily male subjects and their interpretation of female responses in light of them, she shows clear stages of development for women as well.

---

[13] I included this quote, although it is somewhat tangential, as I find many students doing master thesis research encounter this phenomenon. Thus I hope that it can clarify this aspect of the research process.

In examining the failure of modern developmental psychology to take into account the perspectives of women, Gilligan (2005b) commented, about Freud, that his “difficulty in fitting the logic of his theory to women’s experience leads him in the end to set women apart, marking their relationships, like their sexual life, as ‘a dark continent’ for psychology” (p. 693). She aimed similar criticisms to Kohlberg, whose construction sample was comprised exclusively of men.

King and Kitchener (1994, 2004) built on Piaget and Kohlberg to examine how reflective judgment evolves. This is perceived as especially important and relevant to higher education, as critical thinking is closely tied to reflective judgment. Reflective judgment arises when a person encounters an ill-structured problem (Churchman, 1971), or adaptive challenge (Heifetz, 1994) which “cannot be defined with a high degree of completeness, and that they cannot be solved with a high degree of certainty” (King & Kitchener, 2004, p. 5). Their three broad levels are pre-reflective, quasi-reflective and reflective judgments are broken into seven stages, which were found to significantly overlap with other developmental stage models. Reflective judgment goes from assuming that knowledge is certain, to recognizing that knowledge creation involves uncertainty, to using evidence and an understanding of context to support judgments.

Their work criticized two major assumptions underlying “simple stage” models. One was that people were believed to operate at one specific stage at any given time. The second critique was that these stages were cross culturally valid. Focusing on the first assumption, they aligned their work with Fischer’s skill theory model, (1980) and did research to understand and confirm developmental variability. This was framed in terms of Fischer’s notions of functional and optimal performance.[14] They also discussed domain specificity, which can be seen in contrast to ego stage models where development can be perceived as a more central, cross cutting stage applied to all domains, with their notion that performance levels are domain specific (which also fits with Fischer).

Robert Case (1985, 1993) took up Piaget’s work and its application in education, and devised experiments that used one tightly controlled and designed activity to investigate precise steps in infant and child development. He developed models with very clear sub-stages for each main developmental stage. He also helped to develop concepts around “chunking”[15] of skills as part of the process of developing higher order skills.

James Fowler (1981, 2001, 2004) built on Erikson and Kohlberg’s work, as well as drawing on theological sources, by applying a stage development model to meaning making in relation to religious faith. His seven stage model moved from primal or undifferentiated faith, through intuitive-projective, mythical-literal, synthetic-conventional, individuative-reflective and conjunctive, to universalizing faith. One can imagine going from naïve belief in Christian Sunday school stories from the bible to constellations of faith such as Unity church, where a cross cutting mix of narratives and ideas are woven into a more complex theology. He noted Kohlberg’s rationalistic orientation and his turn away from incorporating emotions into his research, making for a missed opportunity to incorporate Mead’s (1934) social interactionist view of the self. It is these issues, the need to address the role of emotion in development, and the role of the environment, as well as a move away from universalizing to studying variation that finds its nexus in the works of Kurt Fischer, whose work I will examine shortly.

---

[14] See the section on Fischer below for descriptions of these terms.

[15] Chunking refers to taking a number of skills at a given level and grouping them into one higher order skill or representation.

This brief overview of a few of the many researchers in developmental theory can only highlight a few interesting points of interest in the field. For a broader overview of the field, I recommend Oliver Robinson's (2013) *Development though Adulthood: An Integrative Sourcebook*.

Cook-Greuter

In addition to the above mentioned researchers, I want to spend a brief time describing my understanding of the work of two figures familiar to many in this field; Susanne Cook-Greuter and Robert Kegan. Their work also falls into the category of Neo-Piagetian, with Cook-Greuter building specifically on the work of Loevinger, and Kegan building on Piaget and Kohlberg. In this way, examining their work could be seen as a continuation of the focus on these early figures as described above.

Suanne Cook-Greuter (1999, 2010) is an independent scholar who, following many years working with the WUSCT, noticed a set of results she perceived as being able to illustrate distinctions within the last stage of Loevinger's model. She, along with others (Kohlberg & Armon, 1984), noted that Loevinger's last two stages were not sufficiently differentiated. She also had collected examples of sentence stems that neither fit the scoring manual nor the upper range of existing ego development theory.[16]

These observations led to refinements in the WUSCT (Cook-Greuter, 1999) and collaboration with Bill Torbert (2004) in developing what became the Leadership Development Framework (LDF) and Leadership Maturity Profile (MAP), which examine stages of cognitive and ego development among managers. Research on manager's stages of development revealed the dominance of conventional stages in that population, in contrast to literature stating that modern organizational complexity requires more post-conventional stages.

In Cook-Greuter's dissertation (1999) she discussed the possibility of stages beyond Loevinger's autonomous stage. She took 1800 late stage protocols gathered over many years and replaced Loevinger's integrated stage with the two new categories, construct aware and universal or unitive, as a way of "striving for a theoretically coherent and plausible explanation of SCT data" (p. 32). This focus on later stages led to an understanding that "one way of looking at postconventional ego development is to suggest that it is characterized by an increasing awareness of the constructed nature of knowledge, and a concomitant, step-wise deconstruction of the assumptions undergirding conventional views of reality" (p. 31).

A fundamental principle used in the scoring of these assessments is to determine what a person can take a perspective on. Perspective taking is seen here as a central component of ego development (in contrast to how it is seen in Dawson's work – to be discussed later) and evolves in taking what one is subject to and making it an object of reflection. Perspective taking evolves from a purely first person perspective, through second and third person perspective taking and on into fourth and fifth person perspective taking capacities, following this subject object progression. The highest stages in Cook-Greuter's model includes the notion of construct aware consciousness, which has been of interest to researchers in various fields, including myself (Reams & Caspari, 2012). At the same time, it is noted that there are many misconceptions about these later stages (Cook-Greuter, 2010).

---

[16] Given that the field of integral studies often concerns itself with later structures of ego development and meaning making, this work has become of great interest for many.

Kegan

Robert Kegan (1982, 1994) built on the foundations that Piaget and Kohlberg, among others established, and articulated a sophisticated model of how the self evolves through a series of "evolutionary truces" or orders of consciousness. His work integrated three major intellectual strands; the humanistic and existential humanistic work of people like Rogers, Buber, Maslow and May, the neo-psychoanalytical tradition from Anna Freud, Erickson, Winnicott and Bowlby, and finally the constructivist developmental approach we have been describing here.

The core mechanism behind development involves the tension between challenge and support. Challenge comes from encountering environmental contexts in which the complexity of the task demand is beyond that of current meaning making. Support comes in the form of a holding environment (drawing on Winnicott's (1965) use of the term) that provides safety and security for taking risks and experimenting with untried and unknown forms of meaning making and subsequent action. Kegan, along with colleagues, developed a more interactive[17] method of assessing these orders of consciousness, described as the subject object interview (Lahey, Souvaine, Kegan, Goodman, & Felix, 1988). This method does not rely solely on written responses, but engages people in a dialog in which they are encouraged to reveal the structure of their meaning making by explaining their responses to specific probes. This semi-structured interview format is similar to those of Piaget and Kohlberg.

Kegan (1994) also has examined the perceived implicit expectations of modern life in a wide range of domains (e.g. parenting, diversity, teaching, psychotherapy and leadership) in relation to these orders of consciousness, finding that these demands place the majority of people "in over their heads." Subsequent work with longtime colleague Lisa Laskow Lahey led to the development of a process for revealing a person's "immunity to change" (Kegan & Lahey, 2001; 2009). This process focuses on helping people perceive the hidden values and commitments driving unwanted behavior, making it difficult to change. By being able to make visible (i.e. take a perspective on what has someone has previously been subject to) and test out the assumptions behind such commitments, progress can be made towards evolving a more adequate and complex meaning making system.

Kegan's orders of consciousness are systematically organized by a series of hierarchically integrated sets of subject object transformations. These are; impulsive, imperial, interpersonal, institutional and finally inter-individual. Focusing on the adult development stages, Kegan has also called the last three of these the socialized mind, the self-authoring mind, and the self-transforming mind. Much of the focus of the immunity to change work is on helping the majority of the population who are operating from the socialized mind and enabling them to engage in the journey of moving towards the self-authoring mind. In this way the immunity to change process functions as scaffolding that provides a structured way to gain perspective on what one has previously been subject to. (You can read more about this in Reams (2009)).

[17] Relative to assessment methods utilizing only textual responses to prompts.

Kurt Fischer and Dynamic Skill Theory

Thus far we have reviewed the early roots of developmental theory, its divergence in the post Piagetian period along lines of soft and hard stage models, as well as a diversity of domain specific models and measures. We now look to focus on Kurt Fischer's work on dynamic skill theory to go deeper into a specific hard stage model that also begins to move beyond a domain specific focus. This will also set the stage for the evolution of a common core metric for measuring stage development independent of specific domains as well as generating domain specific learning sequences.

Kurt Fischer (1980; Fischer & Bidell, 2006; Mascolo & Fischer, 2010; Rose, Rouhani, & Fischer, 2013) was a student of Kohlberg's, and looked to build on his and Piaget's work by better understanding the dynamic relationship between organism and environment. This helped to integrate many cognitive development theories' emphasis on the self with behaviorists' (Skinner, 1938, 1969) understanding of the role of operant conditioning from the environment on development. In order to do this, he began with the core concept of skill. "Skill theory provides an abstract representation of the structures of skills that emerge in cognitive development, together with a set of transformation rules that relate these structures to each other" (Fischer, 1980, p. 479). Like Piaget, who used epistemological structures as his unit of analysis, Fischer uses psychological structures as his unit of analysis. "We define integrative psychological structures as a basic unit of conceptual and empirical analysis"(Mascolo & Fischer, 2010, p. 150).

This model is not explicitly about a self or ego like some of the other developmental theorists described above, and in fact Fischer never uses the term ego in his work. It is a very interactive model, taking biology, structure of mind, social relationships and environmental influences all into account, to develop a general model of development that can be applied in any domain or context.

> To speak of the development of psychological structures is not the same as speaking of the development of a person. There are no general or "all purpose" psychological structures. Although they undergo massive development over the life span, psychological structures consist of localized skills that are tied to particular situational demands, psychological domains, and social contexts. (Mascolo & Fischer, 2010, p. 155)

There are four key aspects of dynamic skill theory that we will examine here; the conception of skills, the role and place of variability, the role of emotion in development, and five transformation rules.

Skills

Fischer's conception of skills is that they are "the capacity to act in an organized way in a specific context. Skills are thus action-based and context specific" (Mascolo & Fischer, 2010, p. 321). He "assumes that cognitive skills can be described effectively and precisely in terms of elementary intuitive set theory" of which "the general definition of a set is a collection of things" (Fischer, 1980, p. 481). He explains that "When people control sources of variation in what they do or think, each such source is a collection, or set, since it is a class of variation" (p. 481).

Fischer (1980) links this to his definition of cognition within skill theory as "the process by which the organism exercises operant control … over sources of variation in its own behavior. More specifically, a person can modulate or govern sources of variation in what he or she does or thinks" (p. 481). Exercising control is an action, always acting on an object, or set (described below). This cognition also adapts to the object or specific thing being acted on. Fischer links thought with action or behavior by showing how abstract or representational thought is built on complex sets of sensory motor cognitions. These levels move in iterative tiers, from sensory-motor, to representational, to abstractions, to principles (see figure 3).

Figure 4. Fischer's set transformations. From Fischer (1980). Used with Permission.

The labels for these levels are designed to represent psychological structures. Decades of research, across different domain specific models has also identified approximate ages at which each stage usually appears. It is also known that the correlation between age and stage lowers at later stages. Fischer then built an iterative model of four repeating processes that form these tiers of sensory motor, representational and abstract skills (see figure 4).

Variability

The development of psychological structures is significantly influenced by context. "Psychological structures are the products of individual adaptation to particular social and environmental demands" (Mascolo & Fischer, 2010, p. 159) and they "consist of dynamic integrations of motive-relevant meaning, feeling, and motor action as they emerge within particular behavioral domains and contexts" (p. 150). While this description of what skills are and a map of how they develop give us abroad outline of development according to skill theory, the picture is in reality much more complex. Central to Fischer's understanding is that statistical averages, the broad generalizations that are the norm in many models of development and psychology, and that lead to static notions of stages, can mislead us into marginalizing, or rationalizing away data about variability. We know from experience that our performance on any given task can fluctuate from moment to moment.

The conception of psychological structures mentioned above is the central unit of analysis in skill theory. However it can be easy to misunderstand how Fischer uses the term. For him, a psychological structure is conceived of as different from a form. "Structure refers to the system of relations by which complex entities such as biological organisms and psychological activities are organized" (Fischer & Bidell, 2006, p. 314). Fischer and Bidell note that a lack of distinction between form and structure has been at the root of major issues in stage theories. Conceptions of static forms, as an "abstraction from structure" (p. 315), have contributed to expectations of "patterns of thought and action to conform to an independent existing form, such as a stage, cognitive competence, or core knowledge" (p. 315). Understanding this issue leads them to foreground the notion of dynamic structuralism to describe how people construct dynamic systems of thought and action. "Psychological structures consist of dynamic integrations of motive-relevant meaning, feeling, and motor action as they emerge within particular behavioral domains and contexts" (Mascolo & Fischer, 2010, p. 150).

Fischer and his colleagues see psychological structures as having their origins in action and clarify how this is to be understood.

> Although the term action is often used as a synonym for 'overt behavior' or movement, the concept of action transcends the distinction between inner and outer movement. The concept of action implies some capacity for agency or control. … Psychological structure is mediated by meaning and experience; meaning and experience are aspects or forms of action. (Mascolo & Fischer, 2010, p. 151)

Thus action becomes a fundamental unit to observe and even measure. It is also emphasized that actions always occur in relation to contexts. Contexts can provide varying degrees of support, and from this you get distinctions between functional and optimal performance levels. Skill performance can fluctuate over a short period of time. Fischer and colleagues make a distinction between high and low support from scaffolding, another degree of contextual support, which allows another to "help" or perform part of a given task along with the person.[18] This enables an intermediate position between simple modeling and observation and learning by doing alone. They also talk about emotional scaffolding and coaching as domains where scaffolding can occur.

This complex set of conceptions leads into the metaphor of development as a web. This is distinguished in 6 ways from the commonly used ladder metaphors.[19] Fischer and colleagues include the concept of developmental pathways which are dependent upon distinct circumstances, context etc., as well as variations within the individual and the choices they make.

---

[18] It is worth noting here the influence of Vygotsky (1978) here.

[19] For example, see Wilber (1996).

They also discuss how the web can represent both variation within an individual as well as different pathways taken by different groups of people.

> It is not appropriate to say that an individual functions at a single developmental level – even for a particular skill. Instead, it is more appropriate to say that an individual's skills function at a range of levels depending on context, domain, time of day, emotional state, and other variables. (Fischer & Bidell, 2006, p. 163)

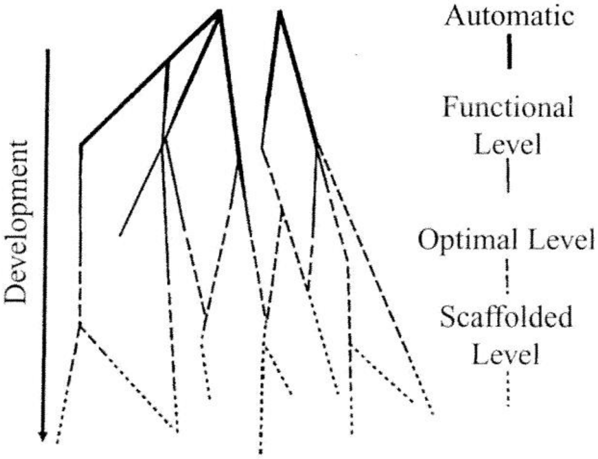

Figure 5. Fischer's web of development. From Fischer & Bidell (2006). Used with permission.

This is illustrated here in the notion of development as a constructive web with layers of; automatic, functional levels, optimal levels and scaffolded level (see figure 5). Research has shown that in performance on a given task, a person can function at range of skill levels. Under conditions of stress, high fatigue or interference, a person might only be capable of the automatic level of functioning. Under normal conditions they can operate at a functional level, which is a well-established level of skill organization, but not yet automatic, so it requires a degree of attention. Modest contextual support such as modeling or prompting, or ideal internal conditions such as peak alertness, confidence etc., can generate an optimal level of performance. Scaffolded levels of skill performance require direct assistance such as co-participation from someone with more skill. The sequence of skill acquisition varies according to many factors (Fischer & Bidell, 2006), one of which involves the role of emotion in development.

Emotion

Emotion is seen to have an essential role in dynamic skill theory. In this section I will draw heavily on the detailed description of emotion in Mascolo and Fischer (2010) to provide a view of how comprehensive the research in this area is. To begin, "any action necessarily involves an integration of cognitive, connotative, and emotional processes" (Mascolo & Fischer, 2010, p. 152). Emotions are determined to involve three classes of components; appraisals, feeling tone, and motive action tendencies. Appraisal processes run unconsciously and are ongoing, and "affect amplifies, organizes and selects these same appraisals for conscious attention. … With development, appraisals become increasingly mediated by higher order meanings" (p. 153). The use of scripts that are programmed responses to changes in environment shows how emotions drive cognition. "Affective changes thereupon select, organize, and amplify one's motive-relevant appraisal for conscious awareness whereas simultaneously activating broad classes of adaptive action" (p. 153). It becomes apparent that emotion is very active in the development of habits of thought and choice that become the basis for action. "With development, through such interconnected circuitry, emotional reactions come to be mediated by increasingly higher order meanings and vent appraisals, whereas implicitly active affective processes continue to organize higher order thought and action” (p. 155).

Next, feeling tone is about the phenomenal or subject experience of emotional states. They are most often described in terms of circumstances prompting the feeling, or as metaphors. Motive action tendencies “consist of voluntary, involuntary, and communicative actions that function in the service of the appraisals involved in the emotional experience” (Mascolo & Fischer, p. 153). These are functional, in that they operationalize the motives, whether they are desired, espoused or actual habits of behavior.

Mascolo and Fischer discuss how all this is integrated, and how higher order cortical control is organized by the lower order processes like emotion/affect which generally function outside of conscious awareness.[20] They also link this to the notion of a triune brain; reptilian, limbic and cortex (Maclean, 1990). The organization of higher order control processes by emotional processes shows the tremendous influence of the earlier formed limbic brain structure.

Transformation Rules

We have thus far looked at cognition, emotion and action, and now we will examine how patterns of organization among them are developed through transformation processes. A simple example of this would be how a young child learns a number of specific sensory motor skills at a systems level. At some point, things like putting on pajamas, brushing teeth, getting into bed and so on go from a system of such skills to being represented under the concept of bedtime. For Fischer, developmental change is “defined in terms of structural transformation in patterns of thinking, feeling, and action within particular domains and context” (Mascolo & Fischer, p. 168). The nature of the transformational processes themselves can be seen as a set of rules. While the levels of development themselves describe the macro developmental process, transformation rules can provide micro, or within level descriptions. They “specify how a skill is transformed into a new, more advanced skill” (Fischer, 1980, p. 497). Fischer lists these as; intercoordination, compounding, focusing, substitution, and differentiation. Differentiation, substitution, compounding and focusing are micro-developmental skills leading and contributing to the macro-developmental transformation of intercoordination.

Differentiation is where what was a single set becomes separated into distinct subsets. The process can occur at either a micro or macro developmental level. This process can be useful when encountering a new task at a level of complexity where one already has skill in a related domain, but can benefit from breaking the task down into subsets at an earlier skill level where there is a more functional level of performance readily available. Substitution involves the transference of a skill from one task to another. The environmental condition best supporting this process is one where all the other variables are held steady and only the specific task itself varies.

---

[20] A very interesting facet of this research has shown that it is possible for negative emotional experiences to skew development in relation to what are normally positive biases. This skewing can lead to more sophisticated cognition about negative situations than positive ones, and has significant implications for understanding behavior.

Compounding is the combination of two or more skills at the same level of complexity. Again, the presence of some environmental factor is required to induce this process. The difference from intercoordination is that the skills operate within a given level of complexity rather than involving a jump to a higher level of coordination. However this kind of compounding process is an important precursor to intercoordination.

Focusing on moment to moment behavior is an even finer grained microdevelopmental process. It is commonly understood as attention. In relation to a given domain of tasks, a person will have a specific set of skills available. Only one of these can be held in the foreground of attention at any one moment. The ability to control a shift in focus can enable a person to move between skills at a given level and contribute to the process of compounding them or even intercoordinating them.

Intercoordination, or reciprocal coordination, is about how a person combines skills to move from one level to the next, much like how we envision atoms with specific properties combining to form molecules with entirely new properties. This process utilizes the micro-developmental skills described above and is dependent on a dynamic interplay between the organism and the environment. As such it cannot be viewed as a purely intentional act of will, but conditions at the boundary interface of the two.

This description of some of the main elements of Fischer’s dynamic skill theory highlights his complex view of development. While there is also complexity in the ego stage theories, and they contribute something vitally important to understanding ourselves, my perception is that they end up needing various refinements or add ons to address some of the core issues that become starting places in dynamic skill theory. Starting from a different unit of analysis and set of premises enables a different picture to emerge about human development. What is yet to be done, in my view, is to truly integrate how these strands of soft, or ego oriented theories and hard or domain specific theories exemplified by Fischer’s dynamic skill theory can together provide a more integral understanding.[21]

Coalescing Around a Common Core Metric

Next, building on the strand of work Fischer and colleagues (and others not described here) have done, I will now focus on the development of metrics related to this conception of development. It was noted that earlier researchers like Loevinger and Kohlberg built their theories together with assessment methods to measure stages. In this section I will examine work done to develop a metric aligned with Fischer’s domain specific model.

---

[21] While this is the view and interests that I have come to at my current understanding of the field, it has been noted that in various academic circles this discussion was ongoing in the 1980s. Currently there is more focus on the distinction between stagnant models, with metrics whose level definitions are content laden and reified, and dynamic models, with metrics that are built to continuously accommodate new knowledge about learning and development. (Dawson, personal communication, March 2, 2014).

Commons

Michael Commons was also one of the students of Kohlberg who perceived the need for a domain independent measure of the complexity of tasks. He developed a model of hierarchical complexity and the Hierarchical Complexity Scoring System (HCSS) (Commons, Trudeau, Stein, Richards, & Krause, 1998) as a way of organizing the complexity required to complete any task or to solve any problem. This model is focused on core structures of stages rather than content or surface structures, and has a mathematical focus. It uses an internally consistent mathematically based understanding of hierarchical complexity, a model that follows the same logics of differentiation through the entire spectrum of development. It uses a mathematical tool called Rasch analysis to assess coherence in responses. Commons (2006) describes what makes his model distinct by noting that:

> First, hierarchical complexity of tasks forms an absolute scale rather than one based on norms, or content. Second, it is formulated in a manner similar to other measures from measurement theory …. Third, it separates the empirical stage of performance from the largely analytic hierarchical complexity of tasks. Fourth, rather than basing stage on some inferred mental or logical operations; stage becomes the performances on tasks of a specified hierarchical complexity that are accomplished. (p. 88)

Commons even later applied this to a cross species perspective (2006), showing how the concept could be applied to tasks of any kind.

Dawson

Theo Dawson's research has

> focused on refining our understanding of the construct that underlies all longitudinally bootstrapped developmental scales (Piaget, Fischer, Kohlberg, K&K, Armon) and, with reference to the domain independent theories and metrics of Commons, Case, Fischer, and Piaget, translated these insights into a refined content-independent developmental assessment system and a set of methods that are used to describe detailed learning sequences in any domain of knowledge. (Dawson, personal communication, March 2, 2014)

This led to a calibrated metric that could be used to assess individual performance. This approach, arising from critiques that noted shortcomings in models that were bootstrapped from conceptual content based on a group of researchers' initial input, focuses on universal properties underlying developmental stages, derived from empirical work and model building. In this section I will attempt to outline the major steps and components in this work, as it provides a way of assessing development in relation to how Fischer and colleagues have modeled it.

Dawson began with a number of studies that examined the relationship and distinctions between existing metrics for assessing stage development. Dawson (2002) is a study comparing SISS, GLSS (Good Life Scoring System) and HCSS. She examined scores from 209 participants between the ages of 5 to 86 and found that all three scoring systems "to a remarkable extent, assess the same dimension of performance" (p. 169). Further work on this was done in another study by Dawson, Xie, and Wilson (2003). In it, 378 moral judgment scores from SISS were also scored with the HCSS. The emphasis here was on separating conceptual content as a scoring element from using hierarchical complexity. The article points to the advantages of a domain general scoring system over systems connected to specific domains and dependent on content for making stage distinctions.

Dawson (2001) also developed a distinction between core structure, surface structure and conceptual content. She noted high levels of inter-rater agreement among different scoring systems and explains this "by positing that core structural features influence stage ratings in all three systems, whether or not these principles are made explicit in a given scoring system" (p. 12). This distinction between core structure, surface structure and conceptual content becomes essential for the development of a common core metric across what were previously researched as domain specific development. The following explains this distinction in more detail.

> The conceptual content layer is the layer referenced when a stage score is awarded based on the explicit presence or absence of a specific conceptualization without reference to any formal criteria. … The surface structure layer is referenced when a particular conceptual content is said to represent a more general principle or concept that is associated in a given scoring scheme with a particular stage. … The layer representing the core structure is referenced when form, organization or relations are in the foreground and particular conceptual content is seen only as indicative of a particular hierarchical order of abstraction. (pp. 9-10)

Dawson, Commons, and Wilson (2005) continued to develop this work and looked at the "shape" of cognitive development. They addressed the debate over whether development is continuous or discontinuous, as it could appear both ways. The result of this analysis was a clear picture of development as a series of spurts and plateaus, supporting the conception of stages of development as discontinuous.

Application

All of the work to support good developmental assessments has been aimed at offering a better way to do testing in education than the current high stakes system. (This is in relation to both K-12 and higher or adult education). Dawson and Stein (2011) talk about fundamental aspects of testing and its impact on students and learning. Questions like what is worth measuring and how it is measured are examined to make a case for shifting how testing is done. By building on Fischer's Dynamic Skill Theory, Dawson aims to provide "methods for building empirically grounded learning sequences in a variety of domains" (p. 9).

As part of this emphasis on education, Dawson (2004), in *A Good Education is …*, examined developmental concepts of education, focusing on epistemological structures. She examined a variety of phenomenological research on education, identifying five qualitatively different conceptions or types of learning. This led to detailed descriptions of how "learning" is conceived at each different level of complexity, and a map of conceptions of a good education at each level. Currently, Lectica (the company developing and administering Lectical assessments) has a number of assessments designed for specific purposes and all built from this common core metric.[22]

The development of these assessments has followed a process of;

- establishing collaboration with other researchers, clients, content experts and end users,
- identifying assessment goals and specific target constructs,
- continuing to work with clients and end users,
- using the LAS to score performances and starting to develop learning sequences,
- organizing these results into rubrics,
- do early releases for field testing, and
- iterate continuously based on data and feedback from users.[23]

A goal of these assessments is for everyone involved to learn – test takers, teachers, analysts and test designers. This helps foster a dynamic assessment system that continually upgrades and incorporates what is learned in the system.

In a commentary on the broader field of developmental assessments in general, Stein & Heikkinen, (2009), noted the issue of how assessments developed with one purpose in mind gain widespread usage for other ends. It appears that not much attention has gone into this issue within the larger integral community of practitioners. The principle of how casual uses of formal theories can lead to misuse of those theories has been explored earlier by Ross (2008).

Reflections

Here I wish to step back and make some observations that have arisen from this journey through developmental theory. First of all I am glad that I invested the time and energy to become more familiar with this broader range of research and theories that taking the FOLA course exposed me to. It has enabled me to see connections between ideas I had encountered in other domains with developmental theory. As well, questions, nuances and limitations arising from the earlier range of theories I had encountered were addressed in ways that make it clearer to me that as a whole, the field of developmental theory has a good grasp on the nature of human growth.

That said, I also recognize that I now am more sensitive to some issues I notice being prevalent in the larger integral community (primarily Wilberian, as I am not as well versed in the discourses of other integrally oriented communities). I will start with one of the more technical issues that can arise. This is a need to clarify the difference between metrics and models. We often use metrics for different purposes than intended, or conflate the tools of measurement with the descriptive models associated with them. (See Stein & Heikkinen (2009) for a thorough discussion of this). Many practitioners use models and metric interchangeably without understanding the importance of the distinction.

---

[22] I have recently had the opportunity to use two of the Lectical assessments, the LSUA (on self-understanding) and the LDMA (on decision making). In addition, as part of the FOLA course, I took the LDPA (a pedagogical skill assessment) twice. I learned a tremendous amount from taking the assessment, reviewing the client assessments, and engaging in a debrief with the clients. The clients all found the reports insightful and useful in offering ways to further reflect on their performance and self-images and undertake specific means for growth.

[23] A more detailed description can be found at https://dts.lectica.org/_about/devmaieutics.php.

As well, the desire to make use of the powerful lens that developmental theory offers can blind us to other lenses that may be more appropriate to understanding a given situation (Edwards, 2010). As well, the pragmatically oriented application of developmental theory and assessments by practitioners who newly encounter the field can lead to misrepresentations, reductionistic application and possible damage to clients. I know how hard it can be to avoid evaluating people and situations with this lens, yet there are more important things in life, (such as character, integrity, love) and we miss out when our vision is skewed by becoming overly enamored with it.

Next, I believe it is important to focus on normative issues in the use of developmental theory. One of the most visible ways this shows up was noted in the section on Piaget, with the (mostly American) tendency to almost obsessively at times pursue vertical developmental growth (which Piaget himself abhorred). While I will be one of the first to stand up in favor of the advantages such growth can bring, I also have begun to emphasize the importance of other considerations such as integrity (Reams & Caspari, 2012) and domain specific skill acquisition (Fischer, 1980; Reams, Gunnlaugson, & Reams, in press). The rush to cultivate vertical development could have an unintended consequence of leaving less than thorough foundations at a given level, or lead to more sophisticated means of justifying self-deception. The notion that such growth is good, and that “integral” stages of consciousness are inherently “good,” thus making it desirable to focus on fostering such growth, can be seen as problematic (Stein, 2010). I am now clearer that the study of human development needs to include a much broader range of intelligences in order to be truly integral and healthy.

At a much more basic level, I have encountered, (and been prone to myself at times), falling prey to the tendency to reify the complexities of human existence into simplistic notions. A favorite is to use Spiral Dynamics (Beck & Cowan, 1996) color language to describe someone as if it was a personality type. This type of reification and reductionism is not limited to developmental stage theory terminology, but can be particularly problematic when it is. One of my aims for this article is that it would make it harder to fall prey to this kind of use of language.

Another issue I find important is the need to better understand the distinction between soft and hard stage models. (See footnote 21 above for a comment on this). I have pointed out above that I feel both of these have significant contributions to make to our understanding of human nature. The first step for me has been to better understand the differences, in both methods and starting places, of each approach. There is something fundamental operating inside each of us that somehow organizes and makes meaning out of human experience. The value of understanding how that evolves is critically important, especially as we aim to move into challenges of leadership is today’s world and see the need for development in adults to more sophisticated and mature ways of engaging the world.

At the same time, our embodiment in this world is through specific experiences that are tremendously diverse. Our tendency to reduce the complexity of this diversity into simple generalizations often misleads us into limited understandings of people and situations. The understanding possible through dynamic skill theory can counter this, and give us a lens for looking in a finer grained manner at individual variation in the diverse contexts in which it occurs.

What I have gained from this journey is primarily a much more nuanced perception and understanding of the huge range of possible ways in which we grow as people. These preliminary observations about the value of and need for integrating these two main stands (ego and domain specific, or soft and hard stage theories) of developmental theory require work to flesh out. (I'm well aware that others may have already begun or done this work, but I've confessed to being a relative beginner at this up front). They are also only one step in a longer term process I aim to engage in. This has more to do with examining and reframing some of fundamental assumptions around the nature of human existence and then seeing what implications this has for the above reflections. Always more to do.

An Exploration of the Meaning-making of Vehement Hardliners in Controversial Social Issues: Reactions to Youth Unrest in Suburbs of Gothenburg Sweden

Thomas Jordan[1]

Introduction

> The solution, as I see it, is first to impose a curfew for those under 18 years and after 6 pm. Then those who are caught in the act should be sent to a correctional institution, no pampering and nice dinners, there should be water and bread. Then parents and children with a foreign background should be expelled from the country for an undetermined time, with immediate effectuation. Only then the authority has done its job. If the hooligans come to my street, there will be a blood bath!
> [Reader comment on a newspaper forum, no. 49]

During the last few years there have been a number of incidents in suburbs of in my own hometown, Gothenburg, Sweden, involving groups of young people who have set fire to cars and attacked police and rescue service personnel with stones. The events have not really been comparable to major riots involving large numbers of people, like in Paris or large UK cities. The number of participants in the disturbances has been relatively small, with less than 50 participants in most cases. As in many other cities, the disturbances have taken place in suburbs characterized by low-income residents, high unemployment rates, especially among youth, and a high proportion of immigrants from the Middle East, the Balkans, Somalia and many other countries. Since such incidents have occurred repeatedly over at least a decade, the general impression is that no effective strategies exist to stop the violence to people and material belongings.

This article does not focus on the troubles in the suburbs as such, but rather on the reactions to them. I am interested in a better understanding of the part of the population that advocate very harsh, radical actions in response to the troubles, and hold contemptuous opinions about the youth involved. The purpose of the article is rather modest. I will report on an explorative effort to pinpoint the properties of the meaning-making of ”vehement hardliners” (explained below) and outline a tentative framework that might provide a point of departure for further, more comprehensive, investigations of the role that complexity awareness plays in the formation of views on controversial societal issues. At this stage, no efforts have been made to review

previous research on related issues, present a stringent analytical framework or conduct more penetrating analyses.

Cars set on Fire in Gothenburg Suburbs

The car burnings and ensuing violence occur in periods. One such period with a lot of incidents occurred during August and the beginning of September 2009. On Friday night, 5 September, cars were set to fire in two different suburbs. On Saturday, the morning newspaper of Gothenburg, Göteborgs-Posten (GP), published several articles about the events, one reporting on what happened in the night before, another with a chronology of incidents during the past month. On the website of GP, a reader forum was opened on Saturday morning shortly before 9 a.m. The headline of the reader forum was: When will it stop? How should the police deal with the young? Website readers started to write comments. In the 2 hours and 45 minutes the forum remained open, 147 comments were posted in the forum.

I happened to see this reader forum while surfing a couple of news websites at about 11 a.m. I got very interested, for reasons I will explain further down, and started to download one page after another of the comments. However, I had just arrived at the most recent comments when the forum suddenly was unavailable. I wrote a mail to the editor in charge and asked for the reason, and got the following response:

> We shut down the commentating, because the posts didn’t keep in line with the topic question, but got more and more racist. ”Put them in a cage in the Borås Zoo” etc.

Indeed. This kind of reader forum is filled with scornful, aggressive, often openly racist opinions, and the actions the commentators advocate are often violent or at least very harsh.

Discussion Forums on the Internet

During the last 4 years, I have spent many, many hours reading posts on open discussion forums on the internet. I have been a reader of two different kinds of forums. One is the aforementioned reader forums of Swedish newspapers. These reader forums are only opened in connection with some articles, presumably when the news reported can be expected to trigger different reactions among readers. Such a forum is usually open only for a limited time, usually a day or a couple of days. However, the number of posts can become large (several hundred) in a short time, as readers comment on a topic they have opinions about. Usually there is a starting question formulated by the website editor, but readers don’t feel very obliged to keep their comments focused on answering this question. The treshold to participate is low, participants do not have to register in order to post comments. I have downloaded and read more than 15 such reader forums on various topics, most of them related to events involving violence in public spaces.

The other type of forum is permanent open discussion forums, where anyone who registers a user account can start a discussion thread. The particular forum I have read almost daily for four years is called Flashback (www.flashback.org). Flashback is a Swedish language forum with a large numbers of sections on various topics. There is one section called Aktuella brott och kriminalfall, which would translate something like Current crime cases. As soon as media report a new murder or other crime of general interest, someone starts a thread about the case and invites other forum participants to join in the discussion. The basic idea is to find out, through collective effort, what happened and why. Such threads can continue for months and even years, and a single thread can come to comprise tens of thousands of posts. I have, over the last four years, read far more than a hundred thousand such posts on the Flashback forum.

One of my motives for doing this is that the internet forums offer me as a researcher a fascinating insight into how (some) people think and feel about issues of societal significance. Since the mid-1980s, I have been deeply interested in the field of adult development. I have in various ways, informally and in formal research, studied the variability in adult meaning-making regarding socially relevant issues, in particular in terms of complexity awareness (see e.g. Jordan, 1998, 2001, 2003, 2006, 2011; Jordan & Lundin, 2001; Jordan, Andersson & Ringnér, 2013). This interest is not merely academic: I do believe that understanding and working with the structures of awareness of individuals and collectives constitutes significant opportunities to contribute to a society with less suffering, more dignity and better lives for human beings. Reading internet discussion forums with a mind trained in discerning patterns of meaning-making of course leads to a spontaneous process of recognizing certain patterns and generating hypotheses about underlying structures.

This article focusses one particular reader forum, which I have studied in a more systematical way in order to pinpoint the properties of the reasoning and develop a hypothetical explanatory framework. However, the background for this case study is a comprehensive familiarity with a very large volume of similar material.

”Internet hate”

Anyone who has been reading internet forum comments on controversial topics has encountered a particular kind of statements. In the Swedish public debate, there is a name for this category of comments: näthatet, the net hate. Participants pour contempt over certain categories of people, who are described in stereotypical, often racist, terms. The tone is judgmental, aggressive and completely devoid of empathy. The posters advocate simple, harsh (often very violent and radical) measures. The messages take the form of firm assertions: what is to be thought of and done about the issue is presented as self-evident. There are no signs of a willingness to inquire into causes and alternative courses of action. On the one hand, we should be careful not to make the same mistakes as these people do, to bundle individuals with different patterns of reasoning into one category, assuming that if they show one of the characteristics, they also have all the other. On the other hand, there really seems to be a recognizable pattern, with many people expressing opinions that do show several of the characteristics described above. For lack of a better term, I will call people who advocate this kind of views vehement hardliners. The term is really meant to be descriptive, rather than evaluative.

I am interested in exploring the structural properties of the meaning-making that engenders (or at least allows) judgmental, simple and undifferentiated views on problematic societal issues. I think that we can safely assume that this kind of meaning-making is an important causal component in many serious societal conflicts and other violent actions.

General Properties of the Data Set

The setting has some salient characteristics that have to be kept in mind when interpreting the data. Participants in a newspaper reader forum are anonymous to each other. They chose a signature when they post and I have in no case seen that real full names have been used. The comments are made spontaneously, without much deliberation, since the forum is open only for a limited time. It is likely that many comments are written on the spur of the moment, perhaps in a state of being upset about a piece of news or by a comment from another participant. We cannot know what the poster would say about the issue in another kind of situation, e.g. when being face to face with other people with different views. We also do not know whether the opinions voiced in a reader forum are indicative of how a person would actually behave in decision-making situations, e.g. when voting in elections or when participating in a neighbourhood meeting. However, there are people who quite consistently advocate the same kind of harsh measures that a lot of forum participants propose. Some of them organize in political parties reflecting these kinds of views, of which some draw enough votes in elections to get represented in political assemblies.

As research material, reader forums of newspapers have the limitation that posts mostly are rather short and that most participants only write one comment. We cannot explore, whether by going through more statements from particular individuals, nor by asking questions, the wider pattern of meaning-making. We only get glimpses of the narratives and perspectives behind the rather brief statements made in the comments. On the other hand, I believe that the kind of views expressed by many of the forum participants are actually representative for the views some people hold on to, but they are views that are, so to speak, fragile if talked about in an research interview situation. In other words, it is probably difficult to get people with this kind of views to speak their mind in a straight-forward way if interviewed by a researcher with recording equipment running.

The limitation is, of course, a major one if we want to arrive at more solid conclusions about structures of meaning-making. However, I believe that this kind of data is useful for explorative studies that can lead to the formulation of empirically grounded hypotheses. Such hypotheses would then have to be tested using richer sets of empirical data, such as interviews, participatory observation or action research (such as engaging people in online discussions).

Quantitative Description of the Data Set

During the 2 hours and 45 minutes the forum was open, 147 comments were posted by 112 signatures. I have, when reporting numbers below, assumed that there is a 1–1 correspondence between signatures used and individuals. That is, I assume that the same individual has not posted with different signatures, nor that different individuals has used the same signature.[2]

Most participants, 90, only wrote a single post. 15 participants wrote 2 posts, 5 wrote 3 posts, 1 wrote 5 posts and 1 wrote 7 posts.

---

[2] It is possible that one individual posts with different signatures, of course, but not very likely.

I made a content analysis in order to identify different categories of content in the posts. I identified five more common categories:

- 74 posts (by 63 different signatures) contained suggestions about what action ought to be taken; measures.
- 42 posts contained critical comments, generally negative value judgements, about certain categories of people: the perpetrators, politicians, journalists, the police or parents.
- 34 posts contained general comments about immigration policies or other aspects of societal conditions and trends.
- 12 posts contained critical comments about other posts.
- 11 posts contained some idea about causes of the disturbances.

Of course one and the same post may contain statements belonging to several of these categories. A few posts did not contain any of these categories of statements. One post was difficult to make sense of, probably the poster was critical of the website editor. One post demanded that the forum should be closed, because of the racist comments. One stated doubt that the perpetrators really were local young people, another asked other posters what they believe about future developments.[3] One poster just expressed personal strong reactions to the events.

A Closer Look at Proposed Measures

As mentioned above, 63 of the 112 participants advocated some type of measures. I have sorted the proposed measures into categories (Table 1). Some posters have offered more than one type of measure, then each is counted into the appropriate category below. In the cases where the same person proposed the same type of measures in more than one post, it was counted only once.

Table 1: Different types of proposed measures

	Number of posters who advocated different types of measures	
a.	Harsh measures towards perpetrators*	33
b.	Deportation of perpetrators (sometimes also their parents)	21
c.	Punishment of parents (including deportation)	12
d.	General repressive measures in affected suburbs (curfew)	7
e.	Increased patrolling (police and others)	6
f.	Dialogue with young people and residents	6
g.	Parents must take more responsibility	5
h.	Residents should strike back (e.g. vigilance committees)	4
i.	More restrictive immigration policies	4
j.	Young people should be put to work	2
k.	More collaboration between different actors	1
l.	Increase support in war-torn areas rather than receive refugees	1

* Not counting ”deportation of perpetrators,” since this is reported separately.

---

[3] ”Will it come to civil war? What do you believe? Who will win? The Swedes, or immigrants who are used to war?”

I count the categories a, b, c, d, h, and i as expressions of ”vehement hardliner” positions. Of course, the advocacy of measures that include painful consequences for perpetrators of violence is not in itself an indication that a person also has a contemptuous attitude, but there seem to be a pattern among many forum participants comprised of a combination of the above-mentioned properties. Of the 63 persons who advocated at least one type of measure, 50 were classified as ”vehement hardliners.”[4] Several of the remaining 13 also used formulations that indicated similar feelings, but they did not actually mention any of the measures classified as ”hardliner.”

Again, we should be careful not to assume that advocating one of the six ”hardliner” measures mean that the person also would endorse all the others. For example, advocating harsh punishments for perpetrators does not necessarily mean that one would also like whole families to be deported.

Many of the commentators who did not advocate any specific type of measures, but commented on, for example, another participant’s comment or general political issues, could also qualify as ”vehement hardliners.” Some of them are strongly sarcastic or bitterly critical of Swedish immigration policies, for example.

Let us now look at what forum participants actually say.[5] I have chosen posts that offer examples of the six types of hardliner measures listed above. Many of the posts illustrate several different characteristics of ”vehement hardliner” attitudes and positions, as will be discussed later on.

Harsh Measures

What is here counted as ”harsh measures” are statements about what ought to be done that go well beyond current practices within the legal system. Some posters advocate violent actions against the perpetrators, others call for harsher measures within the framework of the judicial apparatus. Some statements are not very specific about exactly what should be done, but are emphatic about the need to ”stop pampering.” Here are four examples, illustrative of somewhat different flavours:

> The police should be police
> The police ought to do as in the home countries of the youngsters. Beat the shit to pieces and there will be no stone-throwing. [11]
> Get rid of them
> Send the rubbish to a deserted island in the Atlantic and let them finish off each other!!! Our tax money goes to these vermin when it could be used for children with cancer in our hospitals. Damn it, mankind is so damaged. [99]

---

[4] 26 persons mentioned one of the types of ”hardliner” measures; 18 persons mentioned two types; 5 persons mentioned three types; and 1 person mentioned four of the types (see the quoted post in the beginning of this article).

[5] The posts were numbered in chronological order. They were translated from Swedish by the author as close to the original text as possible in terms of style (including lack of punctuation, for example), connotations and substance. All examples given are the full text of the respective post, they have not been edited. The title of each post is the poster’s own.

> Hard measures
> It is time that we show that we don’t accept this any longer. Whether Swedish or immigrants. That they complain about not having a job isn’t surprising. They don’t give a damn about working in school and believe that everything will be served to them on a silver platter. I live in Hisingen and I see how all the children don’t give shit about anything. This isn’t about hating immigrants, they don’t give a damn about conducting themselves. It is really high time to get tough. No more pampering. The police should arrest the rabble!! [115]

> Change of law is needed
> Change the law so that the police can use its resources to suppress the rioting. Curfew in the evenings and detention camps in Lappland for an indefinite time for the vandals who are caught.
> Reprisals against parents to youth who have not reached the age of criminal responsibility, e.g. deportation. [38]

Deportation of Perpetrators

21 participants, a third of those who suggested measures, advocated deportation of perpetrators. These posters took, seemingly, for granted that the perpetrators have an immigrant background (which in many cases is probably true, but since few perpetrators have been identified by the police, this is not an established fact). Several of the comments in this category explicitly stated that the solution to the problem is simple: if Sweden starts to deport perpetrators, the unrest will stop. Here are three representative examples:

> Deportation
> ...if it now is this way that immigrants and their children is the problem, the regulations ought to be changed so that even 2nd generation immigrants can be deported to the home country of their parents so that they get to know how good they had it in Sweden. Simply deport those who don’t behave. [47]

> Military
> I think one should reward them with a journey to the Middle East! ONE-WAY ticket, we can afford that and we get a whole lot of free apartments for youth who behave themselves. Simple, cheap solution? [134]

> Bye Bye
> Send those who can’t adjust home, it’s in fact rather simple. What would have happened if we had behaved as they do if we went to their home countries. Well, we would probably have been stoned or assassinated in some other barbarian way! [121]

Punishment of Parents

12 participants included suggestions to punish the parents of perpetrators in their comments, mostly in conjunction with other measures (see e.g. post 38 quoted above). Below is one example where punishment of parents is a prominent ingredient.

> The police should get tough
> Hooligans think it is great to tease the police - and other citizens who behave themselves. Give them a lesson, deport when possible to prison terms in the home countries. We shouldn't pay for their rehabilitation (?) [question mark in original] in the prisons here. Make the parents liable for paying the costs – or put them in prison, preferably in their home countries. The problems cannot be talked away – talk doesn't work on criminals. [12]

General Repressive Measures in Affected Suburbs

Some participants suggested increased patroling by the police or others. Such proposals were not counted as ”repressive measures” if not accompanied with harsher conceptions, such as a general curfew or using military for surveillance. The first example included below is particularly belligerent, suggesting that perpetrators should be shot if they don't comply with orders.

> Martial law
> Impose martial law and curfew after 11 pm. Politicians of the region should actively participate with the police and rescue services to secure all areas.
> If disturbances continue, warning shots should be fired and then effective fire on those individuals who don't understand anything else.
> Since some don't adopt the customs of the places they go to, we have to start using the customs they are familiar with. [97]
>
> I think
> 1. Impose CURFEW in affected areas after 8 p.m. until the rioting has ended. 2. Use military and the Home Guard to patrol the streets. 3. Arrest the suspects. [2]
>
> The police ought to retreat one step...
> ... and send in the military and the Home Guard. Those who destroy their own areas don't want the police there, and also no human rights. So impose a curfew and arrest everyone who doesn't comply. If the parents cannot account for where their children are, arrest them too. They should feel it PROPERLY now! There will be no end otherwise. The police should not use their resources for this kind of nonsense! They should be able to focus on ”real people” and ”real crime.” [104]

Residents Should Strike Back

Four participants advocated that residents in the suburbs should get tough and use violence to stop the young rioters.

> Response to JAhman
> But since these youth themselves burn down youth centers, for example, and other things the society has fixed for them and the fact that they have frightened away night wandering adults, who cooperate with the authorities, proves that the society makes efforts. But these individuals show their gratitude by destroying it.

> If they don't want police and order in the suburbs, I suggest that we outlaw these youth, then vigilance committees are free to beat them up royally without penalty. Pay them back in kind! [72]
>
> Take back
> Lock them up and throw away the key. Demand responsibility of the parents, those who can't look after their children and teenagers (up to 19 years, responsibility) should be punished, if they cannot manage they should turn to the social services. People who get children should raise them and not blame the society. Youngsters and vandals who burn cars and throw stones at policemen, fire trucks and trams and blame it on their being terrorized and being outsiders in the society? Vigilance committees soon, COUNTERATTACK! [5]

More restrictive Immigration Policies

Of the participants who explicitly advocated some kind of measure, just four pointed out a restriction of immigration as a key measure. However, quite a few other posters made general comments about how the unrest in the suburbs is a consequence of too liberal immigration policies, or that they would now vote for Sverigedemokraterna, a populist party whose main mission is to radically restrict immigration. Below is a particularly emphatic statement of this sentiment, which I believe most would label racist:

> The reason for this is the immigration of moslems.
> The solution to this problem is effectuated as follows: 1. Stop the immigration of moslems. 2. Start a repatriation program for moslems. 3. Prosecute the moslem parents who have children of minor age who terrorize in the streets. 4. Educate about the doctrine of Islam so ordinary people understand what it is. [146]

A Further Observation

As can be seen in the examples above, quite a few participants use sweeping, undifferentiated formulations about perpetrators, parents and immigrants. In a few cases, this tendency to treat people as an undifferentiated collective goes one step further:

> Reinforce the police
> More police, maybe military to these areas. But NO ambulances or fire trucks. If somebody gets hurt they have to fend for themselves, if they start fires let it burn down. I think an earlier post was good with water bombs with colour :) [81]
>
> Re henke
> Youth centre are you kidding now, or what? if there is anyplace where they have invested a lot of money on youth like in rosengård they built a new youth centre there it was only 1 month or 2 then it was burnt down no this is something completely different like hate of Swedes [125; lack of punctuation in original]

These two posters seem to perceive the perpetrators (and even the suburb residents in general) as a monolithic collective. There seems to be no awareness of the heterogeneity of the people involved, that the perpetrators is actually a very, very small number both of residents in general and of the local youth.

About Proposed Measures

In order to unpack the properties of the meaning-making structure common to the statements I will be using two angles: (1) to find descriptors for the actual content of the statements, i.e. what is present; and (2) to look for what is conspicuously absent in the statements (but might be highly relevant to the issue at hand). One reason for proceeding in this way is the hypothesis that people think and act as they do partly because they have not considered various elements of the complex web of causes, conditions and potential consequences in which a particular issue is embedded. Only through being oblivious to certain considerations, it could be argued, is it possible to uphold some of the hardliner opinions.

Characteristics of Contents

Four characteristics of the statements made

I believe it is fair to describe the character of the statements of the vehement hardliners in terms of four elements:

- Problem and solution are seen as simple (in the sense of uncomplicated, unifactorial)
- Categories of people are treated in undifferentiated terms
- There is a belief that harsh measures will be effective
- The affective tone is contemptuous and vehement

Problem and Solution are seen as Simple (Unifactorial)

The discourse in the posts is characterized by simple statements about the problem and what ought to be done about it. There is seldom any consideration of underlying causes for the unrest. When vehement hardliners at all mention causes, they mostly blame too liberal immigration policies. Explicitly or implicitly immigrants (often specified as moslems) are seen as people with fixed characteristics, and those fixed characteristics is the explanation of their destructive behaviour. The measures proposed are also simple in the sense that only one or a few uncomplicated actions are proposed as solutions to the problem. Several posters explicitly assert that the problem and its solution are simple (see post 47, 121, 134 above for examples): either people should just stop their destructive behaviour, or harsh punishments or deportations will stop the problem.

Some posters comment on alternative suggestions referring to contributing causes for the troubles and explicitly reject, sometimes with a sarcastic tone, explanations other than the inherent badness of immigrants. For example, a suggestion that a lack of youth centers may be part of the explanation for the unrest is ridiculed by a couple of posters.

Vehement hardliners seem to think that it is an easy thing for people to stop acting in antisocial ways and start behaving differently. There is no mention of any conditions that might constitute an obstacle to such a shift in behaviour. The immigrant youth simply ought to understand that even if they are used to other conditions in their native countries, they should conform to Swedish laws and mores when in Sweden.

Categories of People are Treated in Undifferentiated Terms

Youth, immigrants, residents of suburbs and sometimes other categories of people (such as police, politicians) are talked about as if they all share the same characteristics. Vehement hardliners don't seem to feel a need to make differentiations, e.g. by pointing out that their comments only apply to certain subgroups. Statements that can be viewed as blatantly racist, in the sense of attributing collective negative fixed characteristics to ethnic or religious categories of people, are relatively common. A few posts advocate using radical measures, like deportation or harsh punishments indiscriminately towards these collectives (see post 146 above for an example).

There is a Belief that Harsh Measures will be Effective

The strong emphasis on using (only) harsh measures to deal with the problem seems closely related to the simpleness of the meaning-making. Proposals about what ought to be done seem to assume that causality is simple: pain will, if it is strong enough, force perpetrators to change their behaviour. Reasoning about causality is linear and only proceeds in one step. There are no efforts to seek further explanations of the destructive behaviour, nor any concerns about possible negative consequences of the remedies proposed.

The Affective Tone is Contemptuous and Vehement

Many of the statements are permeated by contempt, vehemence and disparagement. Strongly sarcastic comments about various categories of people are common, not only of perpetrators and immigrants, but also about politicians, journalists and other representatives of a society that, according to the vehement hardliners, are naïve, concerned with political correctness and cowardly.

Conspicuous Absences

When comparing the statements of the vehement hardliners with other views on similar events and problems, it is obvious that certain types of thoughts and lines of reasoning are conspicuous by their absence among vehement hardliners. Some such absences are the following:

- Explanations that point to societal conditions, such as marginalization, unemployment, barriers to the labour market for young immigrants, residential segregation, poverty. Consequently there are no proposals for measures targeting systemic conditions.
- Explanations that point to social mechanisms, like lack of appropriate socialization conditions in families with a history of fleeing from war-torn areas and being marked by traumatic experiences, torn social relationships and a loss of customary norm and identity systems. Consequently there are no proposals for measures that aim at remediating the shortcomings of the social conditions close to the perpetrators.

- Conceptions about internal psychological structures and processes among the perpetrators that might both explain self-images and behaviour, and constitute obstacles to development of socially adjusted identities and life trajectories. Consequently there are no proposals for measures that might scaffold development of ego structures and of constructive self-images and skills.
- Reflections about possible negative short- and long-term consequences of harsh measures (such as a escalating antagonism, stigmatization, bitterness, possible loss of legal rights of individuals and the general climate in the society). Consequently there is no reasoning about how such consequences might be prevented or managed.
- Considerations about the difficulties involved in identifying and seize perpetrators and bring them to court.
- Considerations about the possibility of actually carrying out some of the more radical suggestions, such as mass deportation of Moslems, in relation to, for example, Sweden’s obligations to international law and conventions.
- Empathy with and benevolence in relation to people in unfavourable life circumstances (which is just the opposite side of the contemptuous and vehement affective tone mentioned above).

I will summarize these absences into four categories:

- Systemic measures: Absence of measures that address societal conditions in general and social conditions in the immediate environment of the perpetrators.
- Measures to scaffold individual development: Absence of measures that would scaffold development of skills and self-images of youth with established anti-social behaviour.
- Problematization of implementation: Absence of consideration of difficulties in implementation and problematic consequences of harsh measures.
- Empathy: Absence of empathy and benevolence in relation to perpetrators and other parties concerned.

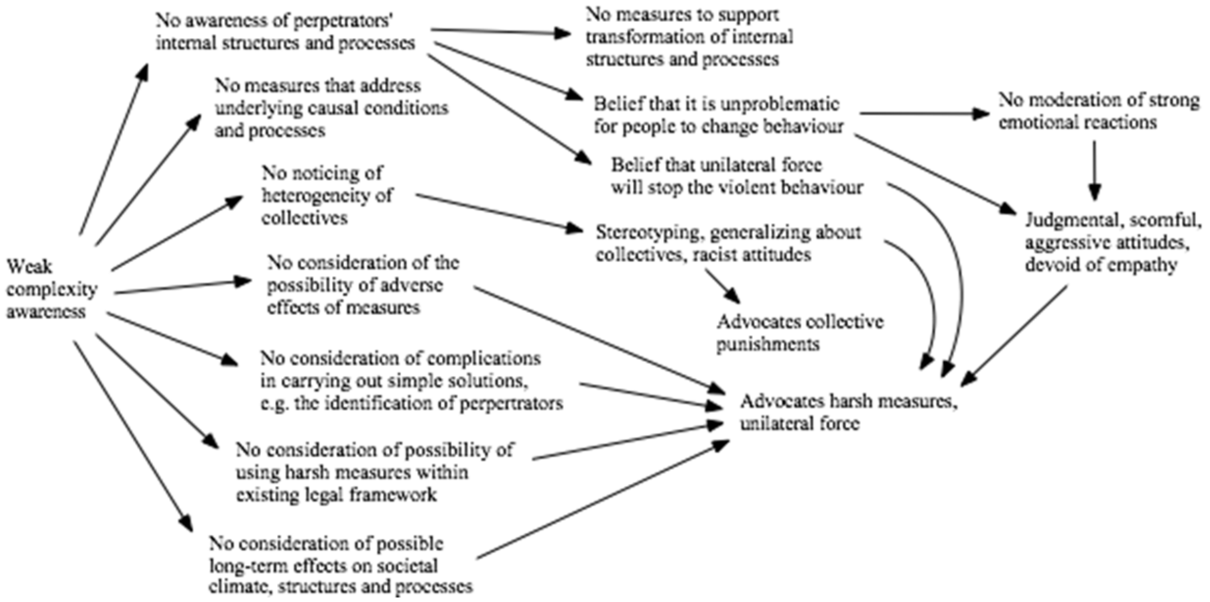
Eight Properties Calling for Explanation

According to the interpretation of the data made in the two preceding sections, there are eight properties of the meaning-making patterns of vehement hardliners that call for explanation: Statements are simple, undifferentiated, harsh and contemptuous, and there is an absence of systemic measures, measures to scaffold individual development, problematization of implementation and empathy.

As has been evident from the discussion above, I believe that one part of an explanation for the existence of the ”vehement hardliner” views is to be sought in properties of the subjects’ meaning-making structures, in particular in the failure of the vehement hardliners to notice and consider causes, conditions and potential consequences of the whole issue complex. Of course a perspective that focusses patterns of individual cognition is only one part of an explanation of the phenomenon of vehement hardliners. Many other explanatory perspectives would be needed for a more complete understanding of the phenomenon, for example consideration of individual emotional biographies (such as attachment types), social constructions of self and others, effects of the properties of online communication technologies, development of socio-economic patterns in the society, media practices regarding reporting of crime, failures of the educational system, and so on. However, a deeper understanding of the internal operations of the meaning-making that leads to vehement hardliner views seems to be a significant contribution to this rather disturbing societal phenomenon.

In an earlier Integral Review article (Jordan, 2011), I outlined a conceptual framework for analysing structures of meaning-making in the context of grappling with complex societal issues. A key concept for me is complexity awareness, which in short points to the degree of awareness a person has of the possibility that issues may be embedded in complex webs of complex causal relationships and conditions (such as being conditioned by properties of the system they are embedded in). An important aspect of the concept is that it points to the expectation (or ”pre-understanding”) that things may be complex in a way that warrants attention, rather that manifested knowledge about actual complex patterns.

In figure 1, I suggest an tentative explanatory model based on the hypothesis that ”weak complexity awareness” is a major contributing factor for explaining the eight properties described above. The basic argument is that vehement hardliner views are only sustainable when complexity awareness is weak. The data set used in this exploratory study is too limited to allow testing to what extent the connections outlined in figure 1 are meaningful as ways to understand and explain the views of vehement hardliners.



Weak complexity awareness
No awareness of perpetrators' internal structures and processes
No measures that address underlying causal conditions and processes
No noticing of heterogeneity of collectives
No consideration of the possibility of adverse effects of measures
No consideration of complications in carrying out simple solutions, e.g. the identification of perpetrators
No consideration of possibility of using harsh measures within existing legal framework
No consideration of possible long-term effects on societal climate, structures and processes
No measures to support transformation of internal structures and processes
Belief that it is unproblematic for people to change behaviour
Belief that unilateral force will stop the violent behaviour
Stereotyping, generalizing about collectives, racist attitudes
Advocates collective punishments
Advocates harsh measures, unilateral force
No moderation of strong emotional reactions
Judgmental, scornful, aggressive attitudes, devoid of empathy

Figure 1: A tentative explanatory framework for vehement hardliner views

I expect that a more thorough study of the properties of meaning-making structures among vehement hardliners, in particular if based on interviews or participatory research (actually engaging vehement hardliners in discussions about their views), would show that the model in figure 1 is too simplified to accurately explain the inner workings of vehement hardliner reasoning. However, I do believe a study designed to critically explore to what extent the connective patterns outlined in figure 1 are valid would yield useful and highly meaningful insights into a the nature of political meaning-making among groups of people who actually say they want to use violence and other very harsh methods for dealing with societal problems. Societal tensions and conflicts may escalate to become serious threats to the possibilities to manage our societies in constructive ways. When this happens, we need knowledge that allows us to develop skillful strategies to deal with destructive political views and actions.

On Spiritual Books and their Readers: A Review of *Radical Kabbalah*

Gafni, Marc. (2012). *Radical Kaballah* 2 Volume Set. Integral Publisher, LLC

Reviewed by Zachary Stein[1]

As a philosopher of education I worry about what people read, and that there are so many of them reading so much. The mass production and circulation of reading materials pre-dates television in demonstrating the breathtaking impact of industrialization on education. Since World War II, more books have been published than in the whole of prior human history, and more people read those books than have ever read anything before. From one perspective the *book* has been a triumph, allowing for profound changes in how people come to gain access to the knowledge they use to understand themselves and the world. But the book is a fundamentally flawed educational technology. For most of their existence books were so difficult to publish that only the most important were printed. This is no longer the case, which is why the design flaws inherent in the book are becoming more and more obvious.

Books are too authoritative, for one. There is no arguing with a book, let alone having it explain something some other way. Books are monovocal and monological, not to mention linear, un-dialectical, and non-dialogical. They are not good teachers because they simply tell you how it is. Even the best book cannot clarify itself, except in so far as it references other books. And, of course, books are notoriously prone to misinterpretation. Consider the mass hermeneutic turbulence produced by our contemporary overabundance of texts: with tens of thousands of books hitting the shelves each month and the overall literacy level stuck at around 8th grade, that's millions of misinterpretations a day, at least. This is especially problematic when it comes to spiritual books. These books are the top sellers, and given their popularity and the broad swaths of the public they attract, *who knows* how the ideas they express are fitting into the conceptual ecologies of readers. Ever since the spiritual counter culture started founding publishing houses in the 1960s, the American mind has been relentlessly disequilibrated by an ever-expanding universe of discourse about the religious and spiritual.

Post-modern spiritual books and their readers are important because they are yet another indicator of major recent reconfigurations of religious authority in America. In 2010, I wrote a paper for the *Journal of Integral Theory and Practice*, called "On spiritual teachers and teachings" (Stein, 2010). In this paper I took a socio-philosophical look at the predicament of authority faced by 21st century spiritual teachers. I was concerned with characterizing the dynamics of teacherly authority and the varieties of educational configurations that surround what Habermas (2002 p. 52) has called "the new de-institutionalized forms of religiosity." I offered a set of nor-

mative distinctions intended to help clarify the value and validity of emerging spiritual teachings and teachers. That is, I offered some ideas about how to separate the "California clap trap" from the forms of religious language and practice that make a legitimate claim as "vehicles for possible truth contents" —again quoting Habermas (2008 p.152). After building a philosophical model for distinguishing between different types of religious educational configurations, I contrasted two educational organizations with illustratively different teachings and teacher-student authority dynamics. Andrew Cohen's EnlighteNext and Dr. Marc Gafni's Center for Integral Wisdom served as foils, allowing me to demonstrate the differences and similarities between these versions of 21st century religious educational authority. Part of the contrast consisted in their differing theoretical orientations, while another contrast centered around the dynamics of teacherly authority and teacherly practice.

A neglected theme in my discussion was the role of religious scholarship and scholarly lineage as an aspect of teacherly authority. That is, I failed to discuss the respective *books* related to each educational organization—and books have always been a critical component of all religious educational configurations. Gafni's books, especially his newest, *Radical Kabbalah* (2012) and *Your Unique Self* (2012a), are texts that belong in a fundamentally different scholarly discourse than most contemporary paperbacks sold by spiritual teachers. Many popular spiritual books, such as Cohen's (2011) *Evolutionary Enlightenment* (or any number of others, such as *The Power of Now* or those by Byron Katie) are texts that stand outside religious traditions and lineages. These are non-lineage texts, without scholarly depth or reference. They are not engaged with any particular religious tradition, although they may reference them and their authors may have practiced with teachers from traditions. It has been clear to me for some time that this divorce from lineage and tradition leads both to a new fangled form of post-modern guru worshiping (where personal charisma makes up for the poor quality of the text) and to a retreat into *ad hominem* arguments against specific teachings (where personal attacks take the place of reasoned debate). So it is that these books draw much of their power from their non-denominational character, their "spiritual but not religious" flavor, and the personal revelations and insights of their authors.

Gafni's books are both like this and not at all like this.

Beyond Popular or Academic: Mystical Hermeneutics and Ecstatic Scholarship

On the one hand Gafni offers books that are post-traditional in that they speak to a broad swath of the public who are either not located at all or not exclusively identified within any particular spiritual or religious tradition. On the other hand they make fundamentally different moves then other books in the genre, moves that require an admirable breadth and depth of scholarship. These texts differentiate from the great traditions but they do not disassociate. Virtually all the other books in this genre fail to make this move and wind up disassociating from the great lineages without being able to generate any comparable source of breadth and depth. Gafni’s books aspire to advance sophisticated scholarship in a specific religious tradition, reconfirming the relevance and power of rigorous scholarship, while moving beyond a merely academic impetus and impact.

To use a well-worn trope from Wilber's Integral Theory, Gafni's books *transcend but include* the rigors of academic scholarship and religious tradition. Whereas most spiritual books are not rigorous enough to pass as a dissertation project, Gafni’s work is at the leading edge of a rigorous tradition of scholarship. The evaluative issues here cut both ways, as the standards of the academy are irrelevant to the motives and impact of many spiritual books. Yet, by transcending and including these standards, Gafni brings his work back into the marketplace of ideas and out of the minutia and irrelevance that can bog down academic writing. The ideas have a richness and profundity that is informed by a rare hybrid of profound scholarship and lineage mastery that comes from engaging and evolving a great tradition. Gafni’s scholarship serves as a model, not only in articulating a new framework of spiritual thought which I will discuss below, but in creating a new genre of book that offers a distinct intellectual strategy for developing and delivering ideas. At the heart of this approach is a dimension of engagement with the traditions that has already been noticed by integral theorist Sean Esbjörn-Hargens (2012), who deployed Jeffery Kripal’s terms in describing Gafni’s work as a form of “mystical hermeneutics and ecstatic scholarship.” This is a key observation, as Gafni is not only a significant third person scholar of his native tradition of Kabbalah, he is also an advanced first and second person adept within the tradition, possessed of realization received from the lineage.

In the Introduction to *Radical Kabbalah* Gafni tips his hand and reveals some of his complex agenda. He calls the book an esoteric transmission, which hides appropriately under the fig leaf of the academic structure and rigor of the work. This is the only section of the two volumes where Gafni drops the academic veneer:

> I am in love with these teachings, awed by their subtlety and profundity, moved by their commitment and depth and enchanted by their possibility. In the book before you however, I have remained faithful to the academy in deploying the tools of scholarship, in seeking to uncover Rabbi Lainer’s [the lineage master whose works are the focus of *Radical Kabbalah*] teaching exclusively, without entangling it, explicitly or subtly with my own. None the less the initiated reader must remember that this is an esoteric work, one which in understated tones, intends to lay down a revolutionary, evolutionary set of spiritual principles which will be recognized as such by those with a pure heart and a clarified self. (Gafni, 2012, p. li)

The casual reader passes over these sentences without much attention, but the more careful observer notes words like *initiated*, *clarified*, *transmission* and realizes that something not *less* but *more* rigorous than traditional scholarship is afoot. Gafni also describes his own approach to the text beyond the classic canons of scholarship:

> In approaching the master and his text... I followed the three-stage path of textual reading implied by the Baal Shem Tov. First, in a state of what the Baal Shem calls *hahna‘ah*, reverential submission to what one is learning, I read every passage again and again, praying that I might realize Lainer’s deeper intention and receive his transmission. Second, I moved from submission to what the Baal Shem calls *havdalah*, separation. In this stage of *havdalah*, I deployed a method of analysis, which involved two basic steps. As I read, I made a list of key topics, words and texts in Lainer. I subsequently gathered every reference to that text, theme or image, searching for the underlying pattern. At the same time I

> studied... many of the original Zoharic sources that would have influenced *Mei Hashiloah*, to get a sense of how he was reading the tradition, what he changed in his interpretation, and why. Eventually, stage two yielded to stage three, which the Baal Shem Tov calls *hamtakah*, sweetening. *Hamtakah* involves an erotic 'non-dual' merger with the text, which occurs when the reader and that which is read become one. It is at this stage that the deeper intention of the Lainer's Torah became startlingly clear, delightful, and beautiful, and the entire teaching opened up with radical clarity and joy. (Gafni, 2012, p. l)

This form of scholarship is both rigorous and mystical—producing a set of books that reward carefully and repeated study. But aside from their distinct position in the scholarly landscape, what is so important about these books, and why as a philosopher of education would I prefer to see them read over than others?

Unique Self: Reclaiming the Personal and Democratizing Enlightenment

To my mind the core value of these books is that they reconfirm (in a compelling scholarly fashion) some of the most central ethical tenants of Western Civilization. Moreover, they do so by reminding us that the Judeo-Christian tradition contains a radical Enlightenment teaching, with a message about the collective Awakening of *everyone everywhere*. Gafni calls this the democratization of Enlightenment. This is a theological metaphysics justifying the reign of an Absolute Democracy, in which each must live so that all have the ability and dignity to be heard, known, and counted. The mystical core of the great democratic political revolutions can be found in the cipher of ancient texts, reinterpreted in each age, and again today, in order to enliven the struggle to create a world-order conducive to human liberation. As Habermas has stressed, there is currently no replacement for the world-disclosing power of religious language, especially in its capacity to give voice to the profound vulnerabilities, interdependencies, and potentialities of human social life.

The core theoretical innovation enabling the democratization of Enlightenment is what Gafni calls, *the reclaiming of the personal*. This idea is presented most clearly where he offers a comparison between two models of Self, his own model of Unique Self and Andrew Cohen's Authentic Self or Evolutionary Self (a comparison undertaken in detail in Gafni's forthcoming book *Two Models of Self and Why They Matter*). He notes that in classic Enlightenment teachings from the East the key move is from the personal to the impersonal. For example, Cohen's community was for many years called the Impersonal Enlightenment Fellowship. This is the classic understanding of enlightenment, which finds expression in many Eastern schools of thought, including Buddhist and Advaita Vedanta. In Cohen's book *Evolutionary Enlightenment*, for example, the word 'personal' is used dozens of times throughout the text, but always with a negative and pejorative connotation. The personal is not to be embraced; it is to be transcended. "Leave your story behind" has become virtually the clarion call of Enlightenment teaching in the Western adaption of most Eastern models.

Gafni (2012a, Ch. 7) points out that the conflation of the *personal* with the conditioned *personality* is a confusion that needs to be corrected. In Gafni's model an essential distinction is posited between the personal before realization (of non-dual radically impersonal Emptiness or

God) and the personal that re-emerges after this realization. The former he terms separate self and the latter Unique Self. Unique Self is thus likened to a structure-stage of consciousness suggesting that to confuse the personal before realization with the personal that manifest post-realization is to fall into what Wilber terms a pre-trans fallacy. No less serious a mistake in Gafni's reading is to denigrate the personal in favor of an impersonal process, such as cosmic evolution, without distinguishing which level of the personal is being addressed. True enough, cosmic evolution (conceived as a panentheistic unfolding) is hierarchically beyond the pre-realization conditioned personality, but it doesn't efface the irreducible dignity of the post-realized personal, i.e. the Unique Self; in fact it find its expression in an infinite variety of uniquely personal forms. This is a lesson that cannot be stressed enough, especially in a context of discourse where an evolutionary ethic has emerged that turns a blind eye toward the tragedy of injustices that resulted from the enthusiasms of previous generations of evolutionary thinkers, from Dialectical Materialism to Eugenics.

Gafni's reclaiming of the personal is the ground of his non-dual humanism and sourced deep in the lineage upon which he draws. The following passage from the Introduction to *Radical Kabbalah* engages this point and is worth quoting at length:[2]

> .....It is in this sense that we can begin to understand Lainer's provocative idea that the Torah was given by a Moses who is merged with God—not in the voice of God, but in the voice of Moses…. Lainer uses the Zoharic phrase 'The *Shekhinah* speaks through the voice of Moses' as a foundation for his position. This Zoharic phrase, describing the authorship of Deuteronomy, was understood in two very different ways. The theocentric understanding, reflected in most Hasidic works, is that Moses was so completely effaced that he became a kind of channel for the divine voice. For Lainer this is only the first instrumental level of enlightenment. The second possible understanding of the phrase 'the *Shekhinah* speaks through the voice of Moses', corresponding to the higher level of enlightenment in Lainer, is almost the opposite: Moses is not effaced, but is rather so completely present that his voice and the voice of the *Shekhinah* become one. Moses' unique persona, his voice and personality, incarnate the *Shekhinah*; through radical uniqueness, he participates in ontic unity with God….the *Shekhinah* speaking comes through the *intensification of individuality,* rather than through its effacement. Because the human is a part of God, the principle of acosmism does not negate but rather empowers the individual. The divine voice finds expression in the voice of the unique spirit, modeled by the prophet who manifests God's voice through the clear prism of his unique individuality. This is the core of Lainer's non-dual humanism. Lainer argues, both explicitly and implicitly, that the unique individual is the portal through which comes the revelation of the unmediated divine will, the new Torah that can override the law of Sinai. In various writings I have called this pivot in Lainer's thought 'sacred autobiography' or 'unique self.' (Gafni, 2012, p. liii-liv)

Now what is especially critical is that this capacity to "incarnate the *Shekhinah"* is understood in Gafni's writing, emergent from all of his sources, not as the domain of the elite but as an innate capacity available to every human being. He adduces relevant texts to overturn the dominant reading of Lainer's model as only referring to the elite and asserts, in Lainer's name, what he terms “the democratization of Enlightenment.” Again, from the Introduction to *Radical Kabbalah*:

---

[2] The term *Shekhinah* is one of the Hebrew names of God, connoting the Divine Presence in the world, often associated with the feminine or embodied existence of God.

> The goal of Lainer’s teaching is no less than the full democratization of enlightenment. He implicitly identifies and distinguishes between two forms of enlightened consciousness. The first is what we might call the instrumental level. At this stage of realization, the person is an instrument, like a flute or shofar, played by the divine. Images describing this stage of illumination were replete in the Hasidic teachings and writings which constituted Lainer’s intellectual framework. This is the level of utter surrender to the divine. As one internalizes this level and transcends it, one comes to another level, which Lainer associates with Temple energy and the Judah archetype. At this level, God does not move through the person as an external force animating and filling the person’s voice, but rather God is incarnate within the person, who achieves a radical identity with the divine. Lainer makes clear that this enlightenment is a possibility for every member of the community. Every human being has the potential of Moses. (Gafni, 2012, p.lii)

This teaching principle of democratization is a pivotal focus in the more popular and accessible companion to *Radical Kabbalah*, entitled *Your Unique Self.* It is the one the defining characteristics of Gafni’s work which seeks not only the evolution of the leading edge but the articulation of a world spirituality that can potentially become a shared spiritual language for large swaths of the mainstream. This language revolves around the idea of “higher individuation beyond ego,” tracing its roots to an enlightenment lineage which places *sacred autobiography* at the center of the awakening realization. Again from *Radical Kabbalah*:[3]

> For Lainer, one who has become fully clarified becomes both the source of revelation and the incarnation of the *Shekhinah*…. Unlike most of the earlier sources, the kabbalist is not an empty vessel channeling the divine. Rather, the unique consciousness of the purified person, and even their unique unconscious, is divine. This implies that the *Shekhinah* that is one’s essence speaks *naturally* from within the enlightened individual. For Lainer, the self of the mystic becomes so conscious as to become transparent to his divine self. Erotic merger with the *Shekhinah* yields not the hermeneutics of sacred text but the hermeneutics of sacred autobiography. In this way, Lainer extends the erotic motif beyond traditional hermeneutics and applies it to reading the ‘text’ of the person’s unique self. This allows the individual to recover the personal revelation of divine will which is addressed uniquely to him. This revelation comes through the unmediated embrace of the *Shekhinah*, which is antinomian in a way in that is clearly different than any previous sources. Lainer’s incarnational *Shekhinah* theology is both empowering and limned with humanistic undertones.” (Gafni, 2012, p. xviii)
>
> Or in a later passage:
>
> Sacred autobiography…is itself a sacred text. It is the book of life. This is Lainer’s implicit reading of the old Kabbalistic teaching from Safed that every person has their own ‘letter

---

[3] I’m talking so often from the Introduction because it is in essence a 60 page summary of the whole work, and beyond this I found that the main body of the text is too closely reasoned and tightly linked up with primary sources to allow for an easy lifting of synoptic quotes.

> in the Torah.' Sacred autobiography both interacts with and, occasionally, even trumps sacred text, superseding one's obligation to the written canon. The initiate will understand that, far from giving easy license to one's desires, this path requires extraordinary discipline. According to Lainer, one can only access this revelation through the identification and embrace of one's uniqueness. Lainer makes a strong distinction between the sense of specialness or uniqueness at an egoic level, which needs to be purified, and uniqueness at the enlightened level of Judah-consciousness, which is both the expression of and the path to full realization. This level of enlightenment may be achieved consistently or even just for a time in an individual's life. It is through the depths of one's unique individuality, one's unique self, rather than in the transcendence of individuality, that one hears the voice of the infinite God in the *lehishah*, the whisper of personal revelation…. (Gafni, 2012, p. lxiii)

This notion of Unique Self changes the fundamental way we think about Enlightenment. Gafni's overarching point is that what is commonly referred to as Enlightenment or Awakening is available to every human being. This move towards the democratization of enlightenment is a core structure not of Eastern but classic Judeo-Christian thought. Gafni points out that a failure to understand the true nature of Enlightenment has kept it from having its critically needed impact as a legitimate modern belief, which would serve as an evolutionary strange attractor for human motivation and aspiration. Gafni redefines Enlightenment in its most basic terms as *sanity*. Once you understand Enlightenment as sanity then the democratization of sanity (aka Enlightenment) becomes a self-evident requirement. What stands in the way is the incorrect conflation of uniqueness and separateness (or personal with personality) which moves Enlightenment teachers to reject uniqueness; this in tern moves the mainstream population, who intuit personal uniqueness to be a critical source of human dignity, to reject Enlightenment.

The importance of these contrasting views of Enlightenment was brought home most vividly for me in two passages from Rabbi Lainer. Gafni explains the context for the passage, which makes reference to a section of the Talmud in which Moses takes the first census of the tribe while it wonders in the wilderness: "The census of Israel in the desert is an affirmation of the radical uniqueness of every individual. *Mispar* [the Hebrew word for] 'number' is not a technical means of identification but rather a badge of each individual's metaphysical uniqueness. For Lainer, the census in the desert is not aimed at yielding population statistics, that is to say, the final number of the community; rather, it is focused on the act of numbering every individual as the revelation of their uniqueness. Lainer states:

> The idea of "lifting up of the head" (taking census) is in accordance with the Talmud (bBer, 58a): 'One person's mind is not similar to another person's mind.' For God apportioned goodness and life to each one in particular, and no one is similar to anyone else. It is therefore written, 'Lift up the head.' That is, every person should be in the place belonging to them. (Gafni, 2012, p 7)

Again, Gafni contextualizes another passage from Lainer on the same theme: "Lainer moves from a language of providence… to a language of the mystique of participation. Uniqueness is rooted in an acosmic metaphysics in which the human being is not merely subject to divine providence but actually participates in divinity. The result of this ontology is the daring, yet obviously necessary, assertion made by Lainer that if one unique soul, *nefesh biferat,* were to be missing, then divinity itself would be lacking. Lainer interprets the phrase "this shall be the number" (Hos. 2:1) as meaning that:

> Everyone will be needed, for from all of the people of Israel God's greatness can be seen. And if one person is missing… then "the goblet would be lacking wine" (Cant, 7:2). Just as when the portrait of the king is drawn on many thousands of tiles—if one of them is lost, the portrait of the king would be lacking. (Gafni, 2012, p. 22)

This image brings to mind contemporary montages in which hundreds of thousands of photos are combined via computer to make one face—the uniqueness of each face unquestionably maintained, while the overall pattern of a single face is also distinctly clear. This is a powerful, if simple, encapsulation of the *acosmic humanism* that is the central scholarly contribution of these books. The theme is encapsulated in the mystical idea that each individual has a unique letter in the Torah—that each person is a unique word in an endless sentence spoken by God, whose illocutionary goal is total self-expression.

These kinds of theological and philosophical arguments for inviolable uniqueness and individual dignity pile up until a fundamentally new image of divinity and awakening dawns on the reader. It is not through the extinguishing of personality or the self that awakening unfolds. The goal of spiritual practice is not to merge one's personal uniqueness into some vast impersonal process. Instead, the goal of the religiosity argued for by Gafni is to become, to borrow his nomenclature, "outrageously *sane,"* to be so *"fully human,"* so fully *yourself,* that you liberate the powers needed to actualize the stunning uniqueness of your life. That is, the goal is to lift up your head and be counted, to affirm your irreducible individual dignity, and be empowered to participate as only you can in the evolution of humanity.

Toward a New Language of Liberation and Social Emancipation

This is all very different from lowering your head to look at your navel in meditation. Why be counted when you are really *nobody*? Why work to build a world that affirms the dignity of each and every person's *illusory* self? The radical teachings in Gafni's books expose the a-political, apathetic, and defeatist underbelly of so much of Western Buddhism, where the teaching of meditation is combined with affluence and liberal values to create an insular and self-affirming escape from the obligations of uniqueness. Who is left to stand up for the inviolable rights of individuals when everyone is sitting down, counting their breaths, and spending a small fortune on retreats from the world? There is no better ideological lubricant to grease our decline into a global corporate dystopia than a form of religiosity that denigrates the individual, promotes quiescence, and calls for a personal disappearance into some larger structure or process.

As early as the 1970's Habermas (1970 p. 27) identified Western Buddhism as a "sedative—an orientation that channels outwardly directed protest into apolitical paths…". Decades later, the critical theorist Žižek (2001) would announce even more provocatively that:

> Western Buddhism is establishing itself as the hegemonic ideology of global capitalism…presenting itself as the remedy against the stressful tension of the capitalist dynam-

> ics, allowing us to uncouple and retain inner peace…it actually functions as its perfect ideological supplement…. Rather than trying to cope with the accelerating rhythm of technological progress and social changes, once should rather renounce the very endeavor to retain control over what goes on, rejecting it as the expression of the modem logic of domination—one should instead, “let oneself go,” to drift along, while retaining an inner distance and indifference towards the mad dance of this accelerated process, a distance based on the insight that all this social and technological upheaval is ultimately just a non-substantial proliferation of semblances…. The “Western Buddhist” meditative stance is arguably the most efficient way for to fully participate in the capitalist dynamic while retaining the appearance of mental sanity. (pp. 12-13)

The point here is not to critique Buddhism as a whole (some of my best friends are Buddhists) but rather just to point out that the most rapidly spreading religion in the Western world (Buddhism) is not a form of spirituality that has been leading its adherents to perpetrate disruptive social change in the name of social justice. The last time that happened on a large scale in this county it was a movement firmly rooted in the Judeo-Christian tradition, under the leadership of a reverend with a dream about the dignity of each individual, the inviolability of human rights regardless of race, and the unique expression of humanity represented by African Americans. Today our enthusiasms for Eastern spiritual imports are leading us away from the discourse about individual rights and democracy leveraged so eloquently by Dr. King, which has served as the most powerful catalyst of social change in history. This language of liberation that is our heritage is being replaced by a language of liberation that is predominantly about the qualities of our own minds and emotional states and which includes the remarkable idea that by sitting for an hour a day on our $90 buckwheat meditation cushion we are somehow helping to change the world. There is perhaps no more iconic representation of the new American post-modern spiritual landscape than a room full of homogenized white people sitting on sets of standardized cushions facing the wall.

In recent decades we have become increasingly homogenized and standardized, as individuals’ lives have been forced into a matrix of techno-economic and political institutions of unprecedented reach and invasiveness. Counterintuitively, reported increases in individualism, narcissism, and entitlement reflect exactly these trends marking “the twilight of the individual.” The post-modern narcissist or entitled millennial are in fact suffering from radical doubt about their own self-worth and unbearable uncertainty about the value of their contributions to the world. As Kohut (1971) and other self-psychologists have taught us, the narcissistic personality is in fact an extremely fragile self-system, one almost totally dependent upon the affirmations of others. Conspicuous displays of self through social media, self-aggrandizing do-gooding, demands for special treatment and attention—these are not signs of the a self blown out of proportion, they are signs of a self desperate to be *seen*, a self needing to be *counted* among the worthy, needing to be *affirmed in its unique worth*.

The cure for the dysfunctions of post-modern identity formation is not a spiritual teaching that tells individuals to look through the illusions of their unique personal essence and beyond the unique time and place in which they live. In fact, the post-modern reader of spiritual books is already tenuously connected to their unique gifts (as opposed to the gifts the media leads them to wish they had) and the unique responsibilities of their time and place (as opposed to those directed toward a world represented through social media). Most spiritual books offer a weak balm for the stinging anonymity and de-personalization of mass-customized lifestyles and post-historical consciousness. These books tell us that our particular personalities and places are to be devalued in favor of some abstract Universal (be it Evolution, Big-Mind, or The Great Perfection), leaving the reader confirmed in their suspicion that their unique life has no special value.

As a way of bringing this point home and as a kind of poetic closing it is worth quoting at length a teaching delivered by Gafni at Esalen Institute in 2012:

> Your Unique Self is your irreducibly unique perspective which fosters your unique insight which creates your unique gift which engenders your unique responsibility to address the unique needs in your circle of intimacy and influence. Are you willing [as a seeker of Enlightenment] to play a larger game? Let me state the core premise clearly. We live in a world of outrageous pain. The only response to outrageous pain is outrageous love. Why can we not access the outrageous love necessary to engage in the evolutionary healing and transformation of ourselves and our reality? Because we shut our hearts to the unbearable pain of the world. Not merely because, as the classic Enlightenment teachers reprimand us, we are stuck in ego. Rather because the gap between our ability to feel and our ability to heal has become too great. It simply hurts too much. Through the virtues of the virtual media we are almost omniscient. We are aware today of a level of suffering that only God was aware of a hundred years ago. But unlike the classic vision of an omniscient but also omnipotent God, we are largely impotent to heal the suffering. Because the gap between our ability to feel and our ability to heal has become too great we shut our hearts and turn inwards in varying mixtures of overt narcissism and more subtle spiritual materialism in the form of soothing meditations and various pseudo-realizations of oneness and enlightenment. This is in marked distinction to the realization of Unique Self that closes the gap between the ability to feel and the ability to heal…. We now come back to our core premise. We live in a world of outrageous pain. The only response to outrageous pain is outrageous love. What does an outrageous lover do? She commits outrageous acts of love. Which outrageous acts of love? Those acts of love that are a function of her Unique Self. In this way the Enlightened Unique Self who is the incarnation of all that is, living in her as her and through her, intimately addresses the unique needs in her circle of intimacy and influence. In doing so she reclaims her potent power—the power of the *Shekhinah* —the power to heal and transform. The gap between the ability to feel and heal is closed. The heart opens once again and a sacred activism sourced in outrageous love perfumes all of reality. (Gafni, 2012b)

Gafni’s work is a dramatic evolution of the languages of liberation that constitute the profound dignity of our Western traditions—languages of liberation that allow us to understand Enlightenment as a potent force for social transformation. This is why I argue for reading some books instead of others. It is in books that we find the images that catalyze our transformation and the words that we use to remind ourselves of who we are and what we are about. Gafni’s books are unrivaled in their provision of a profoundly new language of liberation. These are teachings for our time, which is a time to practice spirituality in the world, fearlessly, with eyes open, and to participate in a planet needing to be transformed by the power justice and love. So I will do something out of character and say: *read these books*. You will be compelled by the rigor and depth of the scholarship, while at the same time swooning from the depth of the ideas. Works like this come along once in a generation.

Review by Jonathan Reams[1]

Why I Wrote this Review

I do not tend to bother reviewing books that I am not inspired by. When I am inspired, I want to offer others the opportunity to be inspired as well, so sharing my impressions becomes a way of offering this opportunity. Twelve years ago I had the opportunity to meet August Turak (or Augie) at a conference called Inward Bound. It was hosted by the Self Knowledge Symposium (SKS) a group of students in the Raleigh North Carolina area committed to self-knowledge and development. Turak had inspired the group's formation, and was a keynote speaker at the conference. Subsequent opportunities to connect with Turak came shortly afterwards, and I recall listening to him tell the story of Brother John, which later won him the Templeton Foundation's Power of Purpose essay contest. The story was inspiring and touched on core values that I have always held dear.

Then this past summer Turak's long awaited book project was finally released. I found the book to be a great combination of principles and stories, both from the monks at Mepkin Abbey, and from Turak's extensive business life. While not of the genre of leadership books that I normally read, my personal experience with Turak made it an easy choice. *Business Secret of the Trappist Monks* is not a how-to book nor a research based book. It is not really a case study, although there are many stories and we do get to follow parts of Turak's own company's story. It is certainly not an academic treatise. Instead I see it as Turak's attempt to transmit to the reader the ineffable qualities of leadership and success he has seen and gained from being able to learn from masters of the art.

In what follows, my aim is to provide a Readers Digest version of the book. Just enough to pique your interest and give a feel for the message it contains, but not so much you feel you have gotten your fill. Turak is a great storyteller, and you would miss much limiting yourself to my short overview. I go chapter by chapter, weaving description with commentary, hoping to hint at the sense of the deeper purpose and meaning behind both Turak and the monks' way of engaging in the world of business.

Chapter 1

Any good book needs to grab the reader with its opening, to somehow convey the essence of its message immediately. Turak does this by telling a story of Father Malachy and his death. After the funeral, walking with another monk and reflecting on how he died comforting others, he hears that “Everyone wants to die like a Trappist. No one wants to live like one” (p. 4). We are met with this image of the core principle of selfless service sustaining itself even in the face of death. What must it be like to live with this kind of grace at the core of our being? How can this way of being apply to our business life?

It is this very point that Turak sets out to prove: that the perceived dichotomy between success in capitalism and selfless service are not at odds, but are actually fundamentally inseparable. He notes examples of other Trappist monasteries renowned for their beer or preserves. Part of this comes from the view of human nature that Turak puts forward; that we all aim to transcend the selfishness of our early experiences of being human, that we all long for a transformation of being to enable us to go beyond ourselves. Why are people like Gandhi and Mandela so often used as models of great leaders? Their lives were examples of this journey of self-transcendence, to a life of surrender to service to others and to something greater than themselves. So how can we mere mortals live such a life?

Chapter 2

So then what is this transcendence we wish to have and experience? We can read, talk and imagine all we want as the means available to us for approaching it. Yet as Turak describes in one of his visits to his spiritual advisor, the 90 year old Father Christian, the gulf between all of the worldly learning and the experience of transcendence itself is “infinite.” Turak confronts the hard questions of the impact that the “success” of capitalism has had on our society; high depression rates, lack of happiness etc. as signs of a lack of this transformation. If we are treating the goals of capitalistic business as ends in themselves rather than simply means, we get lost in mistaking the nature of the transformation we are longing for.

This mistaken pursuit is shown in terms of three types of transformation; that of our condition, our circumstances and our being. He goes into how we “vote” to show what we really want by our behaviors, i.e. how we spend our money – dollar votes. What we spend a lot of money on is stories, whether books or movies or other forms, we spend billions on stories, and the ones that touch us most are the ones that exemplify the hero’s journey. The stages of this journey are briefly laid out and linked not only to examples from well-known movies, but also to business examples. What all of this points to is that our search for transformation cannot be done by proxy – we must undertake it for ourselves. As well, we see countless examples of the most common mistake or shortcut people try to take. For example, believing that we will be transformed by using power to make people treat us differently. Or worse yet, that by transforming others’ opinions about us, we will somehow be transformed. The energy that people expend on these illusory shortcuts are also illustrated in classic themes in storytelling, of turning to the dark side of trying to make ourselves bigger through others. Transformation is an inside job in the end, a renunciation or letting go of self rather than an abuse of self to change others.

Chapter 3

The seeking of this transformation is often latent in us at an early age, misplaced in various ways. Turak tells of a front row seat at a Rolling Stones concert in 1972 which left him feeling disappointed for weeks after. He looks back and sees that he was expecting some transformation of being to occur there, and when the transitory transformation of his condition that the concert provided was over, he did not know how much he linked it to a desire for the deeper, more stable transformation of being, thus his disappointment. This is also linked to noting that we experience self-consciousness as a painful thing, yet long to lose ourselves in a task, forget ourselves in moments of service, revealing our longing for selflessness.

Part of the early training Turak had was spending a year as an apprentice to Louis Mobley, one of the creators of IBM's executive leadership school in the 1950's. There he learned about the importance of mission and purpose, and to "aim past the target." This led to a teleocratic management or leadership model, where service and selflessness are the mission.

One of the joys of reading this book comes from the personal stories Turak tells to show how he has learned many of these principles. As a consultant to a startup, working to help scale a rapidly growing business with a young sales force, he encountered an arrogant young man who resisted all attempts to coach him. A mistake by Turak in cutting off a young woman during a training session led to unease in himself and an inability to make it right. He finally found himself asking this resistant young salesman for help, which led to an opening to coach him and a transformation of his character. He learned many lessons from this, especially the need to go first and be vulnerable.

Chapter 4

In this chapter we learn about "goat rodeos." Stories of the early days of Microsoft were not about the millionaires made through stock options, but about being part of a team that would pull off an impossible task with an impossible deadline. This leads into a description of transformational organizations, both conscious and unconscious. Many startups take off and attract people willing to put themselves into full engagement mode to be able to experience the kind of transformation of being that comes from doing something greater than you ever thought you were possible of, over and over again. Yet if this culture remains unconscious, it often fades.

Turak uses three organizations as examples of how a conscious orientation to transformation of being can enable sustainable commitment and engagement. AA, monasteries, and the US Marine Corps, as different as their domains of activity are, all use methods aligned with consciously creating this transformation of being. They also all aim past the target. For example, AA does not aim to simply get people to stop drinking. This is a byproduct of the transformation of being essential to sobriety. These organizations also all depend on service, whether to God, country or helping someone else stay sober.

Turak talks about the challenge of going through the desert of transformation, or the dark nights of the soul as part of the necessary journey. Shortcuts to avoid this desert fuel sales in the self-help industry, exemplified by the instant, microwave, have it all now, weekend enlightenment seminars. He returns to the story of the move *The Devil Wears Prada* to show how dedication to the process and perseverance get you through the desert, and enable the transformation necessary to move forward on the other side. Turak's own version of this is told in his early adventures as a carpet layer. Later, he describes how his own software company got a chance to have their own goat rodeos when Microsoft would call with an impossible request that needed to be done the same day.

Chapter 5

After laying the groundwork about why a mission of transformation of being through service and selflessness is essential to business success, Turak now turns to the how. How can we enact these lofty ideals in our everyday lives? The first example is a regional credit union that has as its mission to enhance the quality of life of its members. Turak takes what could be perceived as a touchy feely business philosophy and shows how it has enabled this financial institution to guide its decisions and grow even in the recent economic crisis.

He then describes some of the story of how the Trappist movement began with Gethsemani in Kentucky, how Thomas Merton was involved, and those who left to found Mepkin Abbey. This brings him to Father Francis Kline, the abbot during the time of his visits. He uses the word holy as the only way he could describe Father Francis, and my own brief opportunity to meet him allows me to have had a taste of the quality of presence Turak alludes to.

Turak goes on to tell of the founding of SKS, the Self Knowledge Symposium at three Raleigh North Carolina universities and how his commitment to meet once a week with these kids led him to turn down a dream job opportunity. This principle of keeping his word ended up paying off far more handsomely than the potential dream job (the company ended up bankrupt). Through this he learned what his Zen master said about it being more what he didn't do than what he did that made a difference on his journey – he never sold out.

Chapter 6

This chapter looks at how selflessness is tied to community. We will do for others what we will not do for ourselves. We can build culture and community through this by inviting a kind of infectious feeling of the delight in doing good for others. Stories of some of the monks at Mepkin illustrate this. Turak notes his own early experience there effortlessly turning his attitude and actions from selfish to selfless. This results in seeing that the peer pressure a communal team working towards a common mission generates can make it easy to have a culture of selflessness that is infectious.

Chapter 7

This chapter is about excellence for the sake of excellence. Turak links this to the experience of sacrifice and suffering. What motivates this drive to excel is a sense of calling or vocation. While many people think that this is reserved for the few, one of the monks at Mepkin told Turak that "everyone is called to something bigger than themselves. Those who say they're not just never learned to listen" (p. 92). The notion of sacrifice is illustrated in this chapter by various stories. What stood out for me is how the SKS students took on inviting Father Francis to do an organ recital at Duke University's chapel (he had left Julliard and turned down a lucrative recording contract to become a Trappist monk). The faculty sponsor of the SKS group at Duke and also dean of the chapel told the students not to get their hopes up, that free admission to an organ recital might draw 50 people. Instead, the students charged $20 a ticket and created their own "goat rodeo" with a fierceness and passion to make the event excellent.

The event brought in around 2000 attendees, had television film crews present and it became a scene you might expect at a rock concert rather than an organ recital. The money went to charity, and the kids got much more than the experience of the event itself, which was amazing enough. They came away with having accomplished the impossible by learning how to engage their passion and holding themselves accountable for everything they committed to.

This creation of a culture of excellence for the sake of excellence is described as being behind the turnaround Jack Welch accomplished at GE. A case study from Turak's own experience as a vice-president for sales in a company describes how he got the sales team to want to succeed and be excellent. When he asked one of the sales team why the sudden change (this person had gone from having the worst results in sales to the best) he was told "Once you know what it feels like to be your best, you never, *ever* want to go back" (p. 108). This leads to a list of the ways to enact the principles of service and selflessness in a culture of excellence that gives the abstract principles a method.

Chapter 8

This is a chapter about ethics. Questions concerning ethical behavior are not especially concerned with "bad people doing bad things," but with situations that lead to "good people doing bad things from fear and anxiety" (p. 118). In this business model of service and selflessness, the source of ethical behavior is seen to be rooted in three things: having a long term attitude, detachment, and aiming past the target. The long term attitude is not simply something that we can choose. It comes from a sense of timelessness that pervades one's consciousness. Stories of the monk's way of life and view of time illustrate this. It is also seen that an ability to delay gratification comes along with this sense of timelessness.

Detachment was mentioned before, as being the opposite of identification. It is about being rooted in something bigger than one's self that enables a person to change the things in their lives without feeling they are changing their identity. Aiming past the target again comes up. Then all this is illustrated with the story of how Turak's company, Raleigh Group International, was sold to an Israeli company that had been a large client. The process of creating stock options for employees almost delayed the deal past the deadline, (which would have led to calling it off), but was a commitment the owners would not let go of.

Chapter 9

This chapter is on faith, which is viewed as "trusting the process" in a dynamic model of faithfulness rather than a static faith in a belief about some doctrine or dogma. This is then drawn out into the business realm, with the story of how PETA made a protest about the monk's chicken farming and raised a lot of media attention. Despite tremendous support the monks received from their community of customers and others, they decided to shut down the chicken business, eventually going into exotic mushrooms. They were able to do this because their “business” was not eggs, but service and selflessness, and thus the outer form of this could change because they were detached, or non-identified with the form of their enterprise.

Throughout this story, the phrase trust the process was used, and Turak illustrates this further with the story of how his company was finally doing well financially, then the success of the companies they were selling products for led to them being sold, and RGI appeared to be about to lose all their business. This led to a personal time in the desert, of wanting to give up. The story of how Turak kept faith with his commitment to his partners and friends, and the ultimate greater success this brought, generated a feeling of being inspired to be connected with something so worth doing that it would inspire the same commitment and faith in me.

Chapter 10

This one is about trust, where the ever present mantra “trust the process” appears yet again. The first example to illustrate this comes from Turak fracturing his ankle while skydiving and a subsequent deep sense of depression that came over him. This led to his first visit to Mepkin Abbey, where he learned to trust the monastic process, even when at first it did not appear clear how the outer forms of prayer and work would take him though the necessary personal transformation, or “great trial” process. After the long journey through this personal desert, all that was left was a sense of immense gratitude to the monks for them modeling and supporting the process.

The theme of trust in business can be found almost everywhere. Turak talks about this in terms of becoming trustworthy and how the road to this is actually detachment. In more tangible terms, this means letting go of a pride and self-centered identification with a role or territory. He illustrates this with a story of becoming the head of a sales department in a company needing help due to intense infighting and low performance. Seizing up the situation, Turak described how he went around to all the other department heads and asked how his sales department could make their lives better. He then implemented these to demonstrate trustworthiness to the other departments, leading to a turnaround and increase in morale and performance.

The degree that trust is a personal brand is nicely illustrated when Turak received a speeding ticket about 100 miles away from Mepkin Abbey. The judge, upon hearing where Turak was going, said that if he said he wasn’t speeding, then he trusted his word, simply because of the trusted reputation the monks had and how far it spread its influence.

Chapter 11

Authenticity and self-knowledge are the core of what it takes to become trustworthy. The process of gaining these is part of the processes described throughout this book. Here, how one monk’s self-disclosure of his personal journey of facing himself in the desert made a deep impact on Turak. This is then brought out in describing how Louis Mobley created the IBM executive leadership program. After hiring ETS (Education Testing Services) to find the skills and knowledge of great executives, Mobley found that such people were always outliers on the bell curve of any trait, skill or knowledge. What was in common to them was that they had certain values and attitudes, and that these were not the product of training but a certain kind of journey of self-discovery.

From this insight, the IBM program was set up to give executives opportunities to strip away facades about morality, intelligence and so on, to arrive at a greater place of understanding of themselves. This led to executive's ability to help group and team processes of refining a common sense of mission and purpose in terms of the deeper notions described earlier. The personal business narrative from Turak follows the acquisition of RGI and how their core product, which Turak received personal benefit from, was marginalized in favor of the new CEO's business plan. A meeting between them, the new CEO was confounded by why Turak would not fight for his plan and his personal interest, which allowed Turak to say "It's a product, and I have no plans to put the logo on my tombstone" (p. 165).

Chapter 12

Reading the last chapter, on living the life, explicitly named all the things I have also come to know in my own life as essential. One has to commit to the process, and each and every day, in each situation life brings to test us, maintain that commitment. No matter how inspirational reading this or any other book is, Turak is clear that "It is only through the long, slow process of living the life that the living waters of spirit permeate our rock-hard heads, until they finally reach our hearts" (p. 174).

The example here in this chapter touches my own heart, as I came close to part of the narrative. Turak described how Father Francis faced an incurable form of lymphoma that required chemo at a certain point to delay the inevitable. During the period before his chemo he spoke at an event hosted by the SKS group, Inward Bound, and told of his condition and how he was facing it to a group of 220 college students. That evening after his talk, I recall standing with him and Turak watching evening celebrations of ice cream, drumming and dancing in a tent on the lawn outside the campus buildings where the event was held. The simple presence and witnessing the joy of the students was permeated with an aura that lasted long after the event was over and we flew home.

Concluding Reflections

The thing that is hardest to describe writing this over/review is the feeling that reading through the stories of this book evoke in me. Something inside me is touched, and I see my own struggles to come to terms with my life, what I have created and the challenge to take full responsibility for it. At the same time, this feeling opens up a sense of freedom that is both anxious and exhilarating. There is something of this ineffable essence of life that transmits itself between the lines in the book, calling one to follow the path revealing itself before you.

The business secrets of the Trappist monks are not to be found in the usual formulas, even the principles Turak uses to convey these secrets. Nor are they found in the stories of heroic leaders. These secrets are to be discovered in the process of understanding business as a forum for our own and others’ hero’s journey, the passages of life that we encounter to give us the gift of knowing ourselves, and through this being able to transcend ourselves and serve others. The depth of this realization came through in the words of Father Francis, when telling Turak about his cancer. “‘What I could’ve never imaged’ he finished softly, ‘is that my cancer is the answer to a lifetime of prayer’” (p. 172).

Born in the Middle: The Soteriological Streams of Integral Theory and Meta-Reality

Bonnitta Roy[1]

Introduction

At the 2011 Integral Theory-Critical Realism symposium convened at JFK University, Roy Bhaskar noted that both his philosophy of meta-Reality and Ken Wilber's Integral Theory, were both "serious" in that their concerns were to facilitate personal liberation and realize social emancipation. While both philosophers agree that the personal and social domains are inextricably interwoven, the cosmological narratives which underlay their views differ quite dramatically.

Throughout his later works, *From Science to Emancipation, From East to West, and Reflections on Meta-Reality*, Bhaskar is clear that he believes that the natural state of humans, their ground state (which is co-present with the ground state of all beings and entities as the cosmic envelope) is an ever-present reality which is occluded by error, illusion, and structures of un-freedom, and that the way back to freedom, to the alethic truth, and to one's ground state is through the shedding of obstructions. For Bhaskar, the ground state is ever-present and the alethic truth is always operating, but humans have been disenchanted from their god-li-ness, by the nature of human self-consciousness, which has been separated from the ground of its being (from its own god-li-ness) by the occasion of its self-awaring.

Wilber's cosmology rests on the perennial philosophy's notion of enfolded levels of Spirit, unfolding as discrete levels of being through the cosmological force which simultaneous transcends (eros) and includes (agape) prior forms creating a richly textured holarchy of perspectives which arise under 4 simultaneous aspects: subjective interiors, objective exteriors, singular wholes, and plural parts. For Wilber, the ground state of being, is the ever-present primordial perspective, I-I, or original face, which has been "forgotten" so that Spirit can self-accompany in exquisite cosmological play, the impulse of which culminates in Spirit's becoming

self-aware in the highest states and stages of human consciousness. Is it possible to see these are streams in a wider cosmological river where the imperative of the one stream to clear away obstructions, and the impulse of the other to ignite the clear light of awareness can be viewed as a generative system of awakening?

Integrating Structures

The states and stages transcend and include each other, which is to say that each higher level of both states and stages build upon the lower levels developmentally. Lower levels are related to higher levels as parts of greater wholes; and all parts are themselves wholes to smaller parts. Growth-to-goodness is interrupted, obstructed, or pathologized when eros and agape are not balanced or integrated. This can happen in two ways: 1) in the process of developing to a new stage or transcending to a higher state, some portions of the lower level are excluded, shunned, denied, or repressed, or 2) in the attempt toward transcendence, the developmental trajectory is stunted, denied, or oppressed. Because state transformation and stage transitions are de-coupled, it is crucial to nurture both state and stage growth to achieve healthy development. For example, spiritual practices which emphasize and accelerate access to higher states often produce "grossly deformed individuals" due to the lack of adequate nurturing of the other lines, levels and capacities which comprise the stage-structures of the developed self.

Because all development must occur within the quadrant matrix, many models of development that have come from integral theory suggest that the upward trajectory of development is actually more like a spiraling process due to the effect of the dipolar structuration of the elemental categories or deep quadratic structure. For example, ego development is construed to be driven in general by the dialectic between individual agency (UL quadrant) and collective communion (LL quadrant), and in specific, by the dialectic between emergent polarities that arise at different stages.[2] Likewise, psychological self-development (in the individual case) and social development (in the collective case) are both construed as being driven through a dialectic between interior dimensions of growth (intentionality, communicative action) and external dimensions (bio-neural-physical aspects of self, political-economic aspects of society). Integral theory therefore, embraces the dualistic structuration of reality, as essential components of development through states as well as through stages, where the dipolar vectors (or drivers) are eros and agape in the macrocosmic story, and the 4-quadrant matrix structure in the microcosmic story.

Shedding Structures

In contrast to integral theory's developmental "growth-to-goodness" model, critical realism considers growth, development and progress in the conventional sense primarily as obstacles, errors, and illusions accumulated in the fragmented, stratified and dualistic world. Whereas integral theory formulates salvation as additive or multiplicative (freedom + fullness, depth x span) , for critical realism, the path to salvation is primarily a process of subtraction or absenting conditions or structures that occlude, hide, distort, or otherwise prevent us from accessing our innate and always-present state of original grace.

[2] See www.cook-greuter.com

> I think it is important to say here very specifically what we have to lose to become enlightened or realized. First we have to lose our ego, because, being in our ground state, we would see that our freedoms were indivisible. Secondly, we need to be intellectually more generally mentally clear, that is have no fixations, no prejudices, no preconceptions; in a way everything that we know in-built into our being, so that our minds are as free, clear, empty, flexible and creative as possible. Thirdly, we have to be emotionally clear…; So no ego, a clear mind, a pure heart, and then fourthly, a healthy and energized body; that is, we need to be as healthy and energized as we can. But there's a fifth condition, we need our "psychic being" to be clear too, that is, free of all traces and residues of the past, which includes karma from our past in this life and, if we believe in them, our past lives; but also our past in the form of the residues or scars of our experience buried in our unconscious--we need to transform our unconsciousness into consciousness, and, like our karma, clear it, release it, let go of it, get totally free of our past. (Bhaskar, 2002b, p.263)

According to the philosophy of meta-Reality, reality is stratified and fragmented on the macroscopic scale – and dualism and other modes of fragmentation are responsible for the enculturated, indoctrinated and karmically inherited conditions of unfreedom that comprise the realm of the actual. Conventionally, we go about our lives confined to the world of the actual, unaware of our deeper nature (our ground state) and unknowing of deeper, more total and holistic truths. Spiritual intuition, existential angst, and scientific inquiry are all activities which bring us to the edges of a greater understanding through the force of the alethic truth which is always pointing us towards our ground state of being. Human beings experience the "pulse of freedom" as the dialectic between this realm of the actual, and our primary state or natural state of freedom as beings participating in the realm of the real by virtue of being rooted in the cosmic envelope through our individualized ground states.

What does Development Look Like?

For integral theory, development happens in both stage and state processes. Stage development occurs throughout one's lifetime, and is progressive. State changes are transitional and occur as temporary episodes of deep transformative experiences here and there over the course of one's life. There are several neo-Piagetian theories of stage development that fit into the AQAL model. Integral theory's primary focus is on the levels of ego-development that trace the progression of psycho-cognitive development and the set of work, life-style, semantic, and behavioral values that together compose a values system or world-view. Integral theory commonly refers these levels as "colors in the spiral of development."

Individual development entails the accumulation of increasing capacities for navigating an increasingly complex world, including the ability to take multiple perspectives, capacities for double and triple loop thinking, development from concrete to abstract operations, to systems of abstractions and then to meta-systems (or systems of systems) of abstractions, to paradigmatic and then cross-paradigmatic thinking; from pre-dialectical to trans-dialectical (paradoxical) reasoning; from tribal identification to institutional identification to autonomy, and then onto post-autonomous identities; from the rule-based self-identity, to narrative, constructed and/or relativized versions; from ego-centric to ethno-centric to world-centric to eco-centric concerns.

Contrast this with the sequence of "improvements" that matter most to meta-Reality:

> When you do all the negations, when you say no system, no organization, no leaders, no fixed dogma, no fixed thought, no papal thought, no priestly thought, no spiritual authorities, no fixed emotional make-up, nothing, then what do you get when you have stripped all those things away, what do you get? It is not nothing; it is not only just nothing. When you strip away everything that we impose, everything that, heteronomously, we impose on human beings, we get free, creative, loving, spontaneous, energetic, intelligent, right-acting human beings – left to ourselves in what I would call our innermost nature. Technically what I would call our ground state. We are free, creative, loving. We are also right-acting, we will do the right thing and we will love it when we allow it. (Bhaskar, 2002b, 322)

This brings us to two important questions:

1. For integral theory: What drives the need for increasing complexity?
2. For meta-Reality: What gets in the way?

1. On the macrocosmic level for integral theory, the forces Eros and Agape work together as two divine hands of creation, driving the forms toward transcendence by way of inclusion, which is responsible for the complexity we see throughout the cosmos. According to this formula, forms "move forward" (evolve) toward increasing complexity because they "take along" with them all the prior forms as parts in an ever-enlarging whole. On the microcosmic level, development "moves forward" through the prior stages and therefore already conditioned by the prior structures, such that present (present self) is always in relation to both the past (self) as well as the future (self) – an additive, accretionary, iterative and fractal relation wherein the prior forms are enfolded as parts in the present form which will itself be enfolded as a partial whole within the next future, complexified whole.

2. With respect to meta-Reality, thought, a certain aberration of thinking, gets in the way. Bhaskar writes:

> Thinking, naming, judging impedes creativity, loving, right-acting human nature. They drain our energy and they set up repetitive patterns of behavior. They bind our energy. … We cannot even think by thought. Similarly, when we think about doing something loving, we are already taking the love away. When we are being loving, we just love. Thinking about loving is putting a condition on it. For if we do not pay attention to our thoughts, and we do not understand the limits of thought itself, then we will get stuck into this ideology of thought. (Bhaskar, 2002b, pp. 324-326)

Thought, is thinking turned onto itself, by quitting the activity of thinking and mis-taking it as an object. On a macrocosmic scale, this is the underlying mis-take, what Whitehead calls misplaced concreteness, which fragments the world of the actual (what Heidegger would call the ontic representation) from within the realm of the real (the ontological, processural continuum). On the microcosmic scale, this is the error which is called the epistemic fallacy – confusing what we construe to be true for what is really true.

For Integral Theory, epistemic sophistication, which grows through stages of differentiation, complexification and integration, represents a kind of spiritual *progress* because it fills (fulfills) fullness. This is precisely *not the case* with meta-Reality where, under the conditions of the master-slave relationship, people are driven to higher and higher levels of epistemic sophistication as they creatively feed the very mechanisms of oppression they are in pain to escape. Therefore it would be no surprise, in the information age of the era of late-stage capitalism, where *cognitive and conceptual complexity* proves to be the most powerful means of mass indoctrination, domestication and force over others (human and non-human), and where social, political, legal economic, and technological complexity offers the first-ever possibility of *global* control, that meta-Realists would critique Integral Theory's "fullness as epistemic sophistication" as a kind of spiritual sophistry.

On the other hand, meta-Reality has to account for the origin of dualism, and its products – separation and oppression. Dualism may be a product of "captured thinking" – the *thought* that separates consciousness from its ground state, and we, in turn, may be "captivated by thoughts" through a process of forgetfulness or amnesia, and thereafter go about confusing the solidified matrix of opposing perspectives for the fluid ground of becoming – but this merely begs the question: *Where does the ontogeny of "thought-filled forgetfulness" flow forth from in the first place, if not from the non-dual ground where Spirit abides?*[3]

Born in the Middle

We are born *in the middle* – unaware of our own beginnings and endings. By the time a child has learned to name herself, her reality has already been deeply conditioned by the ways of her parents and the language she was born into. The different levels of agency she experiences in her world – from the ability to move her body, the ability to affect her parents' behavior, the ability to manipulate other objects, including small animals and smaller siblings – demonstrate to her that the world is a rigidly stratified place. Objects persist long after their appearances are gone, and people compete for having things the way *they* want them to be. The process of naming things and using language to make sharper distinctions and shape new realities, exaggerates the thing-like nature of reality and weakens the sense of interconnectedness and inter-being. Events and happenings – the feelings of participation – slowly give way to things and their causes. The conventions of life become a matter of utility and instrumentality.

By the time we are old enough to begin to ask questions about our own beginnings and the nature of reality outside of conventional discourse (post-conventional inquiry), our way of reasoning and going about inquiring are already encumbered by layers of pre-conditioned meaning and the pre-constituted self. These include 1) a metaphysical framework primarily fixated with static things, 2) a permanent use of figure-ground contrast to organize reality, 3) conceptual metaphors that are constrained by the rules which govern the physical and gross embodied experience, 4) the implicit laws of reality that are transmitted by the structure of language, especially the subject-object (noun-verb) construction 5) cognitive biases of all types, including the split mind, 6) a privileged perspective based on a limited life experience 7) a diminished perspective based on repression of cultural bias and stereotype, 8) the effects of shadow material at the levels of self, culture, species, and biotic community, 9) primacy of operations in 3-dimensional rather than n-dimensional space and 10) an inflexible apperception of time.

---

[3] Wilber addresses this question with a kind of parable that Spirit creates form because it is lonely all by itself; and then "plays by forgetting."

Only the post-conventional mind can begin to deconstruct all these implicit biases and blind spots. Slowly through inquiry and practices such as mindfulness training, we begin to receive insights. Peeking through some of the biases and releasing some of the conditioned structures of ordinary experience, we begin to experience non-ordinary states. We are shown that the subject-object or mind-body quality of experience can drop away; or that the sense of spatial separation can disappear; or how the mind, starved of stimulus, can manufacture is own hallucinogenic reality. We begin to experience expansions and contractions of time, and space spreads out and become self-luminous. We begin to notice and take note of the conditioned pattern that *is the self* participating in a patterned-upon-patterned world at scales all the way up and all the way down. In other words, we begin to experience the sense of our own beginnings through the deconstruction of the apparatus of existence into the deep phenomenon of pattern. When we are ready to begin again, *from that place we interpret as origin*, the place of elemental principles and primitives out of which we are born – something curious happens. We find we will need to become more and more sophisticated, cognitively, to sufficiently de-couple ourselves from all those conditioned patterns in order to witness them as objects in awareness. We find that we need to create higher and higher levels of abstractions and meta-abstractions to get at the deeper and deeper kernels of reality. In the process we may discover an underlying rule of the dialectically reasoning mind – the deeper the ontological immanence, the higher the epistemological transcendence.[4] By making this distinction, we can see that while meta-Reality is reaching downward, toward an ultimate ontological immanence, Integral Theory is primarily concerned with tracking upward toward increasing epistemological transcendence. Having been born in the middle—we are at risk of splitting apart!

Stratified Reality

In order to make sense of all this, we need to take a look at how Wilber and Bhaskar think about what is real, and how we gain access to truth.

Both Wilber and Bhaskar see "reality" as being stratified or divided among different types of worldviews which have ontological and epistemological components. Both philosophers remind us "the real" is not something "out there" waiting to be known, nor is it something that can be contained inside human perspectives – rather, "the real" is a complex *process* of mutual unfolding of knower and known; and that it is important to see both reality as well as the knower as agents in this unfolding.

Wilber's AQAL theory says the ontological and epistemological components arise mutually and simultaneously to form a single "Kosmic address" which locates both the subject and the world that is disclosed. For Wilber, the real is an enactment. He consistently argues against an ontological dimension that exists independent of an epistemological perspective. Certainly

---

[4] This is one of Bhaskar's insights.

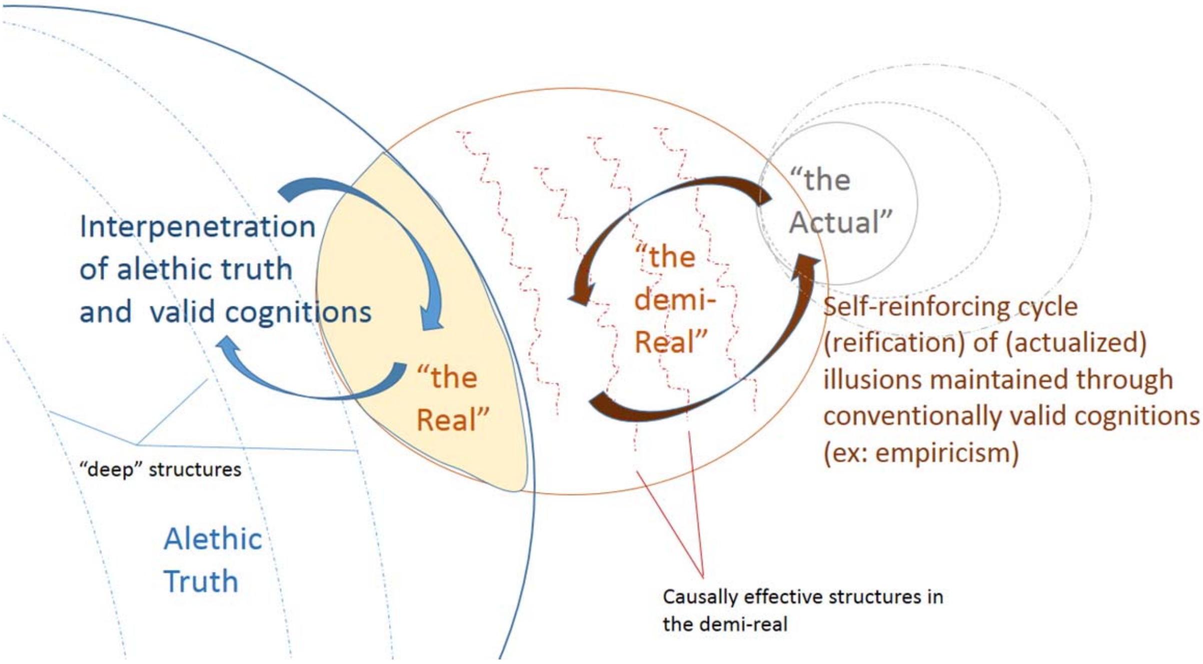
Wilber is not saying that there is no aspect of reality that is independent of human perspective. What he is saying is that there is no aspect of reality that is *independent of perspective.* In other words, there are perspectival worlds that are independent of humans – fish worlds, frog worlds, horse worlds, dog worlds, lion worlds, spider & butterfly worlds, amoeba worlds, plant, algae, plankton and coral worlds, molecule worlds, and atom worlds – Umwelts, as Jacob von Uexkϋll called them – entire worlds composed from the semiosphere of subjective and proto-subjective en-actors in the center of a semiotic enactment triad of mutual agency: the signifier (perspectival agent), the sign (meaning-bearing agent) and the signified (world-bearing agent).[5] Interwoven this way, Wilber's theory says *what is real and what is true* are derived together, and are relative to other *reality-truths* in a hierarchically structured developmental process whereby lower or more primitive *reality-truths* are transcended and include by higher or more evolutionary complex *reality-truths*. Furthermore, because for Wilber, "truth" entails a hermeneutic circle or a nexus of shared signs and signifiers, *reality-truths* become more true and hence more real, through the process of becoming more sharable and more shared. Because the process is never-ending, all *reality-truths* are partial. But the "missing pieces" that make them partial cannot be found except through the enactment process described above. Therefore, we can assume that what *drives the evolution of new, more encompassing reality truths, is the partiality itself—what Bhaskar would call "absence."* In other words, because any given *reality-truth* cannot itself be in relation to "missing pieces outside itself", then "partialness" itself must be an evolutionary driver. Early on, Wilber used the phrase "IOU to the universe" as an expression of this dynamic instability of all *reality-truths.*[6]

In order to make sense of Bhaskar's way of thinking, I have drawn the following which illustrates the various ways Bhaskar distinguishes between different types of realities.

---

[5] Over the past 18 months Wilber and people close to him have intimated that he will soon publish a complete semiotic model of his work. For more than 20 years I have been following the progression of his writings. I see Wilber as continuing to move from Pierce to Whitehead and now back to Pierce (which resonates more with a Habermasian view) without incorporating the important revisions of Hartshorne and Kakol. Whether I have given an adequate account of what might be forthcoming, or not, remains to be seen.

[6] This phrase "IOU to the universe" always reminded me of the kind of radiation that Stephen Hawkins discovered coming from black holes. Nothing can escape a black hole, so it is paradoxical that radiation of any kind would emanate from them. It is as if when a particle enters a black hole, it enters another universe, demonstrating the partiality of this universe, and hence, the need to issue an IOU. My own interpretation of this "coincidence" is not that the universe works in the way that Wilber's theory works, but that the existing physics—the epistemological framework of the existing physics—that we use to explain black hole radiation is true, but partial. Hence, it has this same key feature of Wilber's theory. In other words, I am suggesting that this is not so much a key feature of the universe, but a key feature of our epistemic tools at this stage in human consciousness. Wilber himself, of course, does not need to make this distinction, since he relies on the argument that what is *most real about the universe* is what is *true for our human consciousness* since humans represent the leading edge of evolution.



Interpenetration

Alethic
Truth
Causally effective structures in
the demi-real

Figure 1: An illustrative interpretation of Bashkar's stratified reality.

In the ontological realm, Bhaskar distinguishes the domain of the Alethic Truth from the domain of "the Real." The Alethic Truth does not depend upon human systems or human knowing. It can only be inferred because, although unknown, it is causally effective. We experience the effects of the alethic truth in the many ways our theories go wrong and our predictions fail. We experience it in the deep unsolved mysteries of science and the profound unpredictability of human systems.[7]

The next part of the illustration labelled "the Real" is that part of reality which unfolds through the mutual interpenetration of the ontological realm and human processes of inquiry and knowing. This domain of "the Real" most closely represents Wilber's notion of the mutual dependence of the ontological and the epistemological domains. But for Wilber, it is human development which constantly adjudicates and improves the adequacy or accuracy of "the Real" and therefore every perspective (every "real world that arises) is true, but partial. On the other hand, for Bhaskar, it is the Alethic Truth which exerts a continuous evolutionary pressure on human knowledge systems toward more adequate or accurate understanding, and so "the Real evolves the capacity to express more and more of the Alethic Truth.

Moving to the right, the diagram illustrates the domain that Bhaskar calls "the demi-Real." The demi-real is the world of confusion, illusion, error and make-believe. The demi-Real is maintained by human social convention, habits of language, unexamined assumptions, institutionalized processes of reification, propaganda, advertising, mechanisms of domination and control, narratives and ideologies of all sorts, mythological thinking, wives tales, and cognitive biases of all sorts. The "demi-Real" is the world of consensual pretense. One of Bhaskar's significant insights is that the realm of the demi-real *is also causally effective!* When we mistake the rope for a snake – we jump back! Human illusions become self-fulfilled prophecies over time.[8] When, as the Buddhist say "on the path we mistake the rope for a snake" and then maintain that illusion through stories which are made demi-real by conventional social behaviors, we begin to live in the demi-real:

---

[7] There is no place for this realm in AQAL theory. In fact Wilber has described the realm of Alethic Truth as "a particular Turquoise perspective" – demonstrating once again his insistence that there is no reality that is not coupled with human epistemes. For Wilber, humans are always subject of worlds, never subject to them.

> *The path to the rope is taboo, because a snake lives there.*
> *We prove that there is a snake at the end of the path because no one goes there.*
> *By the time we send an expedition to go there, we discover the snake has gone elsewhere.*
> *We look for "elsewhere" the snake has gone.*

Each one of these "translations"[9] contribute to establish a *known* world Bhaskar calls "the actual." The "actual" is divided into a proper realm and an "improper" realm. The proper realm builds knowledge through the scientific methods which continually expand the contexts upon which knowledge is built—by revealing the conditions of partiality, for example, or by making explicit the boundary conditions under which the derived facts are "true." Proper knowledge is derived by assigning manifest facts to their ever widening contexts. The improper realm is the realm of methods such as empiricism, and what Bhaskar calls "actualism" where systems are founded on error, illusion, falsehood or pretense.[10] These systems can *actually* be confirmed through certain scientific and quasi-scientific methods or community-specific practices such that the experimental set up (or injunctions) are interpreted through methodologies that are validated by hermeneutic circles, to enact (bring forth, maintain) "their actual" world.[11] Still, "this improper actual" world is a false world, and the role of philosophy, is to identify the structures in the "demi-Real" and the improper methodologies that are responsible. For example, at one point in history we could "prove" that boys are innately smarter than girls, by random testing of boys and girls, men and women. Of course, this leaves out the structures of society that privileged the schooling of boys over girls.

Now we can see the basis of meta-Reality's critique of AQAL theory. When the foundations for the perspectives are maintained by methods of inquiry that are steeped in structures of the demi-real, or derived from empirical methods, those perspectives or worldviews are not "merely partial" but rather, *mostly if not entirely false.* Even still, these false views can be maintained by, complexified, and reified into "actual worlds" through human knowledge building processes. A worldview based on apartheid, is a human system that self-maintains a human construction that is false. For meta-Reality, perspectives and worldviews, are *falsifiable*. And therefore we can establish ethical criteria (values) based on factual ones.

---

[8] There are too many examples to list. One being, the belief that boys are born smarter than girls sets up a system of causes and effects in society where boys are educated differently and grow up to be smarter than girls.

[9] As Bruno Latour would call them.

[10] Students of Buddhist scholastics will recognize this partition as between conventionally valid and conventionally invalid truths.

[11] You can see that Wilber's enactment theory is subject to a strong critique from Critical Realist theory.

What makes this “actual” world “demi-real” is that all the “realness” is constrained within the human semiosphere and not in “the world” where the Alethic truth lives. Founded on human error or confusion, realized by human-to-human injunction, enacted through knowledge-building structures and institutions that are anthropocentric and culturally conditioned, and sustained by power structures that are deeply vested in the existing interpretations of reality – the realm of the “actual” becomes increasingly divergent from the real and the true, and therefore, Bhaskar would argue, increasingly distanced from the good.[12]

The Soteriological Streams

I started this paper by introducing the *soteriological streams* of AQAL theory and meta-Reality. A soteriological approach must have something significant to say about *the good.* AQAL theory separates “the big three” – the True, the Beautiful and the Good—in a way that makes them individual and irreducible. The often used tenet in integral circles “you can’t derive values from facts” points to the paradoxical kind of exclusivity of the domains, wherein values (derived from upper left-hand conditions and methodologies) and facts (derived from right-hand conditions and methodologies) do not relate. For meta-Reality however, the deepest “facts” are Alethic truths, and Alethic truths are universal “goods.” When science and philosophy mine the deepest truths, they move us toward the greater goods. For meta-Reality, this is the ultimate validation of pairing philosophy as the handmaiden of science – where the role of philosophy is to “underlabor” for science, by examining and revealing the errors, illusions, mistakes, limiting assumptions, implicit ontologies and hidden metaphysics of the scientific frame(s) of mind, in order to “steer” the scientific enterprise toward the deeper truths and greater goods. But how does this underlaboring happen? What are the key features of practicing this way of philosophy?

In a surprising way, Bhaskar’s Critical Realism sparked a new generation of Object-Oriented Ontology (OOO) just as Bhaskar himself was turning toward the more spiritual concerns of meta-Reality.[13] By reducing the notion of “truth” to that of “fact” OOO philosophers mistake the map (of facts) that science makes for the territory that “resides” in or “abides as” Alethic Truth. As a result they create a world of demi-real which says “truth” and “goodness” reside “in the objects themselves.” This is clearly a step backwards.

---

[12] A strong critical realist critique sees the developmental stages popularized as colors in Spiral Dynamics and AQAL theory, not as deep evolutionary structures of “the real” but as a taxonomy of “actual” structures derived from the “demi-real” structures of late-stage capitalism. This strong critique would argue that the competitive and rivalous nature of capitalist economy “drives” the complex adaptive system “human” through higher and higher levels of complexity – a process Bhaskar refers to as “the continual creativity of the slaves.” Therefore, for critical realists, the only way “out” is not “further up the spiral,” as Wilber claims, but starts with the complete deconstruction of capitalist ideology and the complete decomposition its socio-cultural structures.

[13] Bhaskar’s move toward a spiritually informed Critical Realism caused a major rift in the Critical Realist community worldwide, where much of his work on meta-Reality has been outright rejected, including Bhaskar’s interest in integral theory.

A Gnostic Revival

A way forward would be to reclaim the notion of *alethic truth* from the dialectics of philosophical meta-discourse, and situate it inside a kind of revival of Gnosticism. In philosophical discourse we are confronted with the categories “epistemology” and “ontology” – which relate to knowledge and reality. These are the kind of categories that the synthesizing mind of Aristotle was comfortable with. Valid knowledge is simply “truth,” and valid realities are simply, “real.” Yet the Greeks made the distinction between these kinds of categories which appeal to the dialectically reasoning mind, and the gnostic terms which the dialectically reasoning mind cannot capture.

From this view we realize that *alethic truth* is neither an ontological term nor an epistemological term in the philosophical sense. Similarly, the Greek word *gnosis*, which is usually translated as “knowledge” is neither an epistemological term nor an ontological term. Gnosticism is a kind of knowing that does not depend on the relata of epistemological and ontological categories, nor their mutual dependence, nor their interpenetration. Similarly from a Gnostic view, *alethic truth* is a kind of truth that does not depend on the relata of epistemological and ontological categories, nor their mutual dependence, nor their interpenetration. As long as the soteriological program sticks with the meta-discourse of dualistic, dialectical mind, our theories will continue to drive us apart.

Looking, Seeing

John Whitney Petit’s (2002) book *Mipham’s Beacon of Certainty*, stands out as one of the most important and clearest exegesis of the complex map-territory (epistemology-ontology) problem. Petit is clearly immersed in philosophy’s soteriological streams:

> If philosophy is understood as a process of historical development without a specifiable goal, or as a deconstructing meta-discourse that parasitizes the naïve speculations of earlier ages, the classical Indian understanding of philosophy’s purpose might seem impoverished. As the handmaiden of religion, philosophy might not function as a transforming process, but as the rigid armor of dogma. However, the neglect of a critical philosophy in a soteriological context tends to result in the degeneration of religious and philosophical traditions into partisan insularities. This was a major concern for Buddhist philosophers. Philosophy imbued with the spirit of *moksa*[14] is more likely to draw people together than drive them apart. (p. 104)

In these few pages, Petit makes some key distinctions. For instance, he notes that philosophy based on *aletheia* is similar to Bhaskar’s subtractive approach—“a method for removing ignorant misconceptions about the nature of things.

---

[14] *Moksa or* Moksha (Sanskrit) means emancipation, liberation or release. In eschatological sense it connotes freedom from samsara, the cycle of death and rebirth. In epistemological and psychological sense, moks(h)a connotes freedom, self-realization and self-knowledge. *Moksa* carries the same meaning as my term *view* (see Roy, 2006)

Petit introduces the important difference between the verbs "looking for" and "seeing." When the function of theoretical meta-discourse, is properly understood as a process of "looking for," it is no surprise that the process is never-ending. As the familiar joke goes "why do I always find the thing I am looking for in the last place I look?" When the content of our philosophical discourse is abstract formulation, we are involved in the *activity of looking for* rather than in the *direct experience of seeing:* "When one is attempting to fathom the nature of things through the medium of abstractions, it is as though one were looking for something" (p. 105). It is in this sense of "seeing" that *gnosis* refers to a *direct perception* not a perspective.[15] As "seeing," Petit writes, "philosophy is conducive to gnostic vision."

Guidelines

In attempting some kind of conclusion, I would like to propose some guidelines of a gnostic view of soteriological philosophy, employing Petit's useful terminology.

First, from this view we see that epistemology is the domain of the human experience of "looking for." This impulse of "looking for" drives the knowledge-building systems of human thought in science and philosophy. Epistemology refers to the plethora of outcomes, including theories and methodologies that result from this impulse. Because perspectives are shaped by "looking for" as distinguished from the perception of "seeing", they too are part of the epistemological domain and are subject to persistent error, illusion and confusion and thus, persistently advance into higher and higher orders of complexity.

Secondly, the "looking for" impulse is intersubjectively maintained through philosophical and scientific discourse and methodology. This is the purpose of the hermeneutic circle—the collectively held responsibility of "looking for" shared in the spirit of *moksa.*

Thirdly, this collectively held responsibility requires interpretation, and interpretation builds what Petit calls "contingencies of culture and history." This is the situation described as structures in Bhaskar's "demi-reality." These structures are "real" to the extent that they participate in the collectively-held project of "looking for;" yet they are not real to the extent that they limit, by abstraction and complexification, the experience of "seeing" as direct perception. When the activity of "looking for" gives way to the reductive and reifying "scientific" project of replacing the "looking for" with a false sense of "seeing that," the realm of the actual takes us further into meta-discourse that "parasitizes the spirit of *moska*" and farther away from the processes of self-transformation.

Fourth: Petit writes: "When one sees something as opposed to looking for or at it, one participates profoundly in the seen[16]" and "Unless the experience of freedom in personal realization is integrated with philosophical discourse, however, it is difficult if not impossible to share that realization with others." This is where the deconstructive sense of *aletheia* comes into play as the proper methodology for theorizing which "conveys a destination", or "orients others in the right direction." If the "destination of looking for" is the "seeing," then the destination in the "seeing" becomes an impulse to share this realization with others. Those theories that conclude or worse, preclude, the "looking for" by offering a set of conditioned propositions to "look at", betray the soteriological impulse. For philosophical theories with soteriological intentions, the moral implications of this are profound. Only through a shared experience of "seeing" can the moral imperative be satisfied.

---

[15] The reader should note whereas a "perspective" is either an epistemological term, an ontological term or both, depending on the philosophical meta-discourse being applied, a "direct perception" is neither an epistemological term, nor an ontological term, nor a relata between them.

[16] See Appendix II

Together, these four prescribe the right view of a soteriological philosophy: 1) perspectival diversity and conventional knowledge are outcomes of "looking for" which 2) is an intersubjectively shared and hermeneutically maintained aspect of the collective human condition, which 3) is partially conditioned by error and confusion, and as such tends to parasitize the spirit of *moska* and therefore 4) the valid theory is one which a) deconstructs the error and confusion that arises, b) orients others toward knowing-as-direct perception, and c) sets the conditions for a shared experience of gnostic vision.[17]

We now have an answer to the first question: For integral theory, what drives the need for increasing complexity? Answer: The human project of "looking for."

This in turn brings us to our second question. How is it that we are for most of us for most of our lives, "looking for" instead of "seeing?" For meta-Reality: "What gets in the way?"

Cultivating *View*

The capacity for direct perception is an innate faculty of all beings—in this sense, "direct perception" is similar to Whitehead's notions of "prehension." If we consider all "things" as *prehending beings*, directly perceiving each other, we enter into the view which has been called *pan-experientialism* – where reality is constituted by every"one" experiencing every"one." As a theory, pan-experientialsim describes the processural continuum comprised of the participation of all beings. And yet, we do not always experience reality this way. Unlike direct perception or direct participation, *view* entails relative degrees of "correctness" or "freedom." The senses perceive "what is" directly. But experience is constituted by perception *and* context.[18] Furthermore, the context or interpretation is limited by *view*, which metaphorically can be thought of as a "viewfinder." The degrees of freedom in one's *view* determines how much of the context enters into the experience. In this sense, *view* is a capacity for allowing in more and more of reality into one's experience of it. Alternately, *view* describes the capacity for experiencing more and more of one's *participation* with all others. When our immediate experience of reality includes a direct perception of our participation with all beings, we have realized the *correct view.*[19]

---

[17] People who are familiar with my work will recognize that "collective insight practices" includes the deconstructive movement as well as orients us toward a direct perception, (he ah ha! moment) and a realization that is collectively shared.

[18] We can say that perception and context = perspective.

[19] I attempted to describe this *view* in my paper presented at the 2013 Integral Theory Conference:

> To participate, means to enjoy movement and reciprocity within the generative ground of our universalized becoming and the foregrounding of our being. To participate means to act and to be

Let's go back to the story of the rope that is mistaken for a snake. The senses perceive "what is." If all of the reality enters in as context, then the person will experience the rope as a rope. If, however, the context is limited to a memory of a snake that once bit a dog, then the person is most likely to experience the rope as a snake. When the villagers hear her story, even though their senses perceive the words directly, if the context is limited to this story, then their experience will be one of limited participation, and they too will mistake the rope for a snake.

Our existential situation is such that neither our sensory faculties nor our capacity of view are fully developed at birth. We are born in the middle – with the sensory faculties of a child which begin to develop mostly inside the context of a ready-made adult world, partially conditioned by error, illusion and confusion. Because both direct perception and participation *as well as* context are shaping our experience, we being to suffer from a kind of existential dissonance, and begin the long process of "looking for." A "good" theory orients us toward the direction of a correct *view*, where direct perception arises with the experience of an adequate participation with reality. When the correct view is cultivated to perfection, we enter into a state of complete freedom and full participation. If Integral Theory and meta-Reality are concerned with an adequate soteriological philosophy, it would be important for practitioners to examine their claims in the context of this notion of *view*.

acted upon, to affect and effect, to mediate both spatial and temporal extension in infinite directions and dimensions. To participate means to be "in the soup", not somehow above, beneath, behind the action, through the veil of transcendence, assumption of objectivity or inference of subjectivity. To participate means to lose track of cause and effect, agent and object, knower and known, actor and script. To participate requires a pre-conceptual or post-dialectical orientation to reality as "a movement, a happening, a transformation … as events that are constantly transformed." (Oliver & Gershman, 1989) To participate means, as Whitehead would have it, is to be in a relationship of feeling among a society of all other entities, human and nonhuman, biotic and a-biotic, within a nexus of shared history.

Appendix I

The diagram below illustrates the major philosophical streams originating in the pre-dialect "oceanic" era of the past and branching into three distinct dialectical philosophical streams where it situates Wilber in the perspectival (toward the hermeneutic and epistemological), and Bhaskar in the dialectical (toward the empirical and ontological). The third stream represents a transitional form between the soteriological philosophies inherited from Buddhist scholastics, and western process metaphysics evolving toward a true, post-dialectic "onto-logics."[20]

Appendix II

The phrase "direct perception" carries some ontological baggage for the dialectically primed mind, since the question in the background is always "direct perception of *what*" – which leads the dialectically constructed mind to posit an ontological reality that is being perceived. This leads to the false dualism of subjective agent as perceiver and objective (non-agentic) object as perceived. This is the same problem with the semiotic triangle. The term "participation" is more appropriate to a modern gnostic vision, in which all aspects of reality are actively "participating" with all others, such that the phrase "direct perception" actually refers to full participation of all reality in all reality. As such, "knowing" is a kind of participation, but we can and do participate without knowing, which can, from the view of "direct perception" be experienced as an obstruction, whereas from the view of participation, it is not. However, knowing as meta-discourse can parasitize *awareness of participation* by creating a false sense of somehow being "above the soup and out of the fray" as it were.[21]

January 2015 Special Issue Introduction

Issue Editor: Bahman A. K. Shirazi

Once again, we are gratefully delighted to share with the readers of Integral Review another cross-section of scholarly writings based on the Founders Symposium on Integral Consciousness at the California Institute of Integral Studies in this special issue!

The first few articles in this issue represent a cross-section of topics in integral education ranging from integral methodology to pedagogy. We start with *Integral Education in Light of Earthrise* by Craig Chalquist. This article explores the relationship between integral education and the emerging terrestrial consciousness—a consciousness of interdependency, sovereignty, and earthly responsibility. It asserts that integral education is well positioned at this time when urgent environmental catastrophes threaten our planet, to help us recover an integral relation with the universe and our planet Earth, and contribute to restoration of a sense of earthly wonder and reverence.

The next article by CIIS president, Joseph L. Subbiondo, titled *The Dynamic Unity of the Opposites: Haridas Chaudhuri's Integral Method and Higher Education*, highlights CIIS founder's principal methodological approach known as Integral Dialectics and its related principle of the 'dynamic unity of the opposites,' as an essential aspect of his unique model of integral education. Integral dialectics aims at reconciliation of what appears to the mind as polarized conceptual opposites and engages the totality of human experience, educating the whole person beyond the dualistic rational methods of Western education.

My article titled *Integral Epistemology and Integrative Methodology* provides an introduction to integral epistemology and integrative methodology through a discussion of basic ontological principles of integralism and their implications for developing integrative approaches to knowledge. As an application of the integral dialectical approach the current dichotomy between qualitative and quantitative research methods is reconciled by showing that various research methods belong to a wide spectrum of methodologies that correspond to an integral epistemological gradient. Lastly, I discuss 'integral dialectical synthesis,' 'unity-in-diversity,' and 'analytico-synthetic integration' as three basic strategies for integrative research.

The next article is a unique collaborative project by a group of fellows and teachers from the Integral Teaching Fellowship Program at CIIS titled *Positionality as Knowledge: From Pedagogy to Praxis*. In this article, the authors Sara Maria Acevedo, Michael Aho, Eri Cela, Juei-Chen Chao, Isabel Garcia-Gonzales, Alec MacLeod, Claudia Moutray and Christina Olague help the reader better understand the epistemological relevance of positionality in integral education and critical pedagogy, encouraging students and educators to recognize their social positionings and reflect on how the institutionalization of their social identities not only inform the lenses through which they view the classroom, but also influence how they participate in the classroom. By employing an integral learning model, a learning community is transformed into a

SOME RIGHTS RESERVED

dynamic positioning field, in which students and educators interact and co-create knowledge beyond their habitual or institutionally imposed positionings.

The final article in this subset is an example of integral scholarship by a current CIIS student, Robert V. Burke, who explores two personal non-ordinary state spiritual experiences in the context of traditional yogic potentials, also known as siddhis, in his article *Manifest Transpersonal Experiences: Aṇimām and Laghimā Siddhis*. Such experiences which are not likely to be discussed in traditional higher education exemplify the nondual, non-rational and non-ordinary transpersonal states through a specific discussion of how *aṇimām siddhi* of infinitely small somatic perceptions and *laghimā siddhi* of levitation are manifested.

The next two articles are philosophical in their scope. First, Karabi Sen in her article titled *The Restoration of Wholeness* explores one of the key principles of integral philosophy—wholeness. Sen argues that integration is a developmental process which takes place in time and space. The self matures, shines and brings itself to fruition only through trials and tribulation due to loss of wholeness—without which we would not have a vision of what constitutes wholeness; nor would we aspire after its retrieval. Sen asserts that the journey to integration is difficult when we separate ourselves from our fellow humans and other forms of life or see ourselves as different from the soil and air and water that make us. Once we see ourselves in all that surrounds us and recognize them in ourselves uniting is not hard any longer. When we unite with the world we achieve a united, harmonious, whole self within as well.

Individuation, Cosmogenesis and Technology: Sri Aurobindo and Gilbert Simondon by Debashish Banerji is a fascinating exploration of the philosophy of conscious evolution emerging from different cultural backgrounds and historical eras. Banerji argues that the idea of conscious evolution, which has sometimes been seen as a philosophical consequence of Darwin's evolutionary theory in the life sciences, is more importantly related to the enhanced scope of human subjectivity made possible by technology. This essay considers the ideas of two generations of thinkers, focusing on Sri Aurobindo (1872-1950) from the earlier generation, and Gilbert Simondon (1924-1989) from the more recent era, questioning the consequences of contemporary technology in their thoughts, goals and practices. In developing the historical continuity of ideas, it tracks the question of technology from the earlier to the later generation, highlighting the understanding of both its promises and its ills and engaging with it the possibilities of conscious evolution.

Our last article is an integral psychospiritual case history of Etty Hillesum, a Jewish woman whose letters and diaries kept between 1941 and 1943 describe life in Amsterdam during the German occupation. *Unfolding Toward Being: Etty Hillesum and the Evolution of Consciousness* by Barbara Morrill is an account of the unfolding of Etty Hillesum's developing consciousness from an integral individual evolution of consciousness perspective. In the introductory section some parallels and similarities between aspects of transformation of consciousness and personality in integral yoga psychology and the work of A.H. Almaas and Karen Johnson, the developers of the Diamond Approach, is drawn upon to set the stage. Subsequently, based on her diaries, the spiritual and psychological journey of Etty Hillesum is examined in the context of the stages described by the Diamond Approach's method of inquiry.

CIIS owes much gratitude to Integral Review for providing the opportunity for this publication!

Integral Education in Light of Earthrise

Craig Chalquist[1]

Abstract: This article explores the relationship between integral education and the emerging terrestrial consciousness—a consciousness of interdependency, sovereignty, and earthly responsibility. It asserts that integral education is well positioned at this time when urgent environmental catastrophes threaten our planet, to help us recover an integral relation with the universe and our planet Earth, and contribute to restoration of a sense of earthly wonder and reverence.

Keywords: CIIS, Earthrise, Ecology, Ecopsychology, Ecospirituality, Integral Education, Sri Lalita, Tripura Sundari.

In 1912, the supposedly unsinkable RMS *Titanic* sank, ending its career on the bottom of the sea, exactly where the gods of the Greeks had confined the Titans, those gigantic, inflated, world-offending powers whose acts of hubris against the natural order laid them low. Perhaps a useful question to ask as the oceans rise might be: How can integral education as we tend it at the California Institute of Integral Studies (CIIS) equip humanity to evolve beyond unsustainable, unjust, world-wrecking titanism?

"Integral" is a word with many meanings, but they all derive from a Latin word for "complete, whole." Here at CIIS we use it to mean forms of education that bring together wisdom traditions, fields of knowledge, and embodied practices into meaningful new combinations. How we teach here embraces not only the intellectual, but also the experiential and the applied, or to say it in shorthand: not only the mind, but the body and spirit. As a depth psychologist I would add *soul*, not as a metaphysical entity but as the felt sense of what is numinous, surprising, and enchanting. A root of "integral" is *tangere*, which means "to touch."

In 1968, the year CIIS was founded, astronauts from Apollo 8, the exploratory project whose mission patch bore an infinity sign joining the Earth and the Moon, saw our planet rise in beauty over the lunar horizon and were captivated—touched. Although they never fully emerged from their state of awe, they did take some marvelous pictures up there without fully realizing that the images announced a new era.

[1] **Craig Chalquist**, PhD., is the program chair of East-West Psychology at CIIS. Craig focuses his scholarly writing and teaching on depth psychology, ecopsychology, qualitative research, Systems Theory, ecotherapy, and mythology from a psychological perspective. He practices what he refers to as "Deep Education": the kind that invites the human relationship to nature, elements, creatures, and Earth to shift from mere utility to deep appreciation. He also trains psychotherapists in ecotherapy techniques, has presented at Bioneers, and gives local presentations on "Gardening and Mental Health." Craig is on the editorial board of the journal *Ecopsychology* and a member of the International Association for Ecotherapy.

This conjunction of events strikes me as meaningful and anticipatory. A few years before the astronauts beamed the famous Earthrise photograph back home, Rachel Carson (1962) published *Silent Spring* to warn the world of the dangers of unregulated pesticides. As new CIIS students witnessed dialogues between depth psychology, shamanism, Buddhism, and tantra, as Earthrise spanned the gulf of scientific inquiry and soulful response between planets and within the hearts of appreciative spacefarers, as Dr. Martin Luther King lay in peace after giving his life for what he called the Beloved Community, as demonstrators marched for peace and equality in Chicago, Atlantic City, Mali, Mexico City, Paris, and Prague, and as bombs stopped falling in Vietnam, the world watched as a new terrestrial consciousness, a consciousness of interdependency, sovereignty, and earthly responsibility, began to melt away archaic dualisms of nation, gender, religion, and race. "You see the whole Earth," stated Joseph Campbell (1991) in the year of his death, "without any national divisions at all." (p.41). This dawn of Earthrise, and of what Sean Kelly (2010) refers to as the Planetary Era, also heralded the gradual rapprochement of self and world, culture and nature, inner and outer, celestial and terrestrial. As Earth rose up and shone in collective consciousness, humanity beheld a vision it had never seen, not in a million years of evolutionary and preevolutionary time: our homeworld glimpsed as a whole entity. "With our view of Earthrise," Campbell stated in an interview,

> we could see that the Earth and the heavens were no longer divided but that the Earth is in the heavens. There is no division and all the theological notions based on the distinction between the heavens and the Earth collapse with that realization. (Joseph Campbell quoted in Marler, 1987, p. 61)

He also referred, as would the astronauts who came later, to "the opening of the heart and eyes to the wonder of the world we're in” (p. 61).

Why is this sense of deep appreciation and wonder of our planet so important? Read the latest environmental news and you will see the grim results of their lack. We will not protect and cherish what we do not love. The environmental crisis now upon us presents, on many levels, a crisis of the capacity for reverence. My question has evolved somewhat: What can integral education contribute to this sense of earthly wonder and reverence? How (as I ask my students) might we feel truly at home on our homeworld?

Wonder and reverence for the beauty of nature and Earth have never been scarce at CIIS. In 1972, Dr. Haridas Chaudhuri, co-founder of CIIS, gave a speech here in San Francisco—the city, be it noted, where the United Nations Charter was signed—about the work of his teacher Aurobindo Ghosh. In that speech Dr. Chaudhuri spoke of bringing spiritual realization down into physical presence, an action with the potential of transforming our material lives into an expressive image of the Divine. Citing Sri Aurobindo, he described this as "a cosmic evolutionary process" that could lead to "the establishment of mankind's age-long dream of the kingdom of heaven on this planet." These ideals link the personal, the spiritual, the cultural, the cosmological, and the planetary (Chaudhuri, 1972, para. 12).

In 1975, Father Thomas Berry, who loved the natural world and called himself a geologian, held up Sri Aurobindo as an exemplar of meeting contemporary troubles with ancient spiritual practices and insights. Berry wrote, "He decisively answers those who say that Indian spirituality has nothing to contribute to modern humanity and insists that Indian spiritual traditions are fully capable of entering into the modern world of science and historical development."(Quoted in Ohara, 2014, p. 86)

For Aurobindo, as for Berry (2009), "The political and economic, the scientific and technological, the artistic and the literary, the spiritual and the religious are all valid forms of human existence that must be preserved, developed, and integrated with one another." (p. 15). Sri Aurobindo's spiritual partner Mirra Alfassa, usually known as the Mother, was even more emphatic about the earthly base of deep spiritual work. Criticizing practices that take leave of planet and body in search of higher realms, she asked,

> Why should life have begun at all if it is only to be climbed out of? … Evolution is not a tortuous path which brings us back, somewhat battered, to the starting-point. It exists in order to teach the whole of creation the joy of being, the beauty of being, the grandeur of being, the majesty of a sublime life and the perpetual development, perpetually progressive, of this joy, this beauty, this grandeur... It is on earth that we progress. It is on earth that we can accomplish. It is in the body that the Victory is won. (Alfassa, 1977, p. 424)

The land stewardship at Auroville, which she founded, demonstrates the ecological dimension of her vision.

To emphasize the continuing Earth connection at CIIS I would draw your attention to the school's logo of interlocking triangles. These are the yantric emblem of the Indian deity affectionately known as Sri Lalita, "She Who Plays," Tripura Sundari and the Red Goddess. Ancient depictions associate her strongly with aspects of the natural world, from the pot of honey she holds to her lotus, her lion throne, and her arrows made of flowers. Her hair is said to smell like flowers, and in some tales she is herself symbolized by a red flower. She created fire and gods and stars, grew mountains from her breasts, and she wears the sun and moon for earrings. Yet she is also associated with cities and urban places, suggesting that in her eyes, nature and culture need not stand in opposition. She rode around on a chariot built of light.

Although Sri Lalita is as lovely and seductive as an idyllic landscape or a purely flowing river, she can be a demanding deity, for she asks us questions for which we find no ready answers. How shall we tend the natural world from within the urban heart of cities as towers rise all around us? How can we be responsive to Earth's needs from within a square building? How do we teach renewed nature access with so little of it to rely on here?

We take our cue from nature: we make do.

Our faculty include adventurous souls who have performed fieldwork in indigenous communities, taught dance in sacred sites and shrines, and gone outside to counsel the poor. We do art and photography in nature, at home, in the classroom, and in the streets. We have courses in ecopsychology and Earth-rooted spiritual practices and programs in Integral Ecology and Ecology, Spirituality, and Religion. Some of us have worked with Joanna Macy, a true elder and mentor in her a lifetime of dedication to the Great Turning away from an industrial growth model of society toward urgent visions of a life-sustaining civilization. Our feminism courses include ecofeminism. As of last summer CIIS became a signatory of the Earth Charter, an international blueprint for a just, peaceful, and sustainable world community. The East-West Psychology department, has created a Certificate in Ecoresilience Leadership to train participants in how to guide groups of people frightened into helplessness by climate change news move beyond denial and paralysis into reflection and effective action.

One of the oldest dualisms challenged by the image of Earthrise, a dualism as old as writing, places everything pure and green outside in Nature and everything mechanical and degraded in the city, which we leave on excursions or vacations into still-verdant locales. But why not invite the greenery into the city? Our faculty, staff, and students quest for visions in the desert and the jungle, but they also bring back some of what they find out there. At CIIS we even make our own honey. The Red Goddess would like that—just don't tell her we named it after one of her sisters.

I am sometimes asked what relevance our integral learnings and psychospiritual practices still possess now that multiple environmental catastrophes have begun to sweep the entire planet surface. My reply is: "More than ever." In the words of Thomas Berry (1999),

> To recover an integral relation with the universe, planet Earth, and North America needs to be a primary concern for the peoples of this continent. While a new alignment of our government and all our institutions and professions with the continent itself in its deep structure and functioning cannot be achieved immediately, a beginning can be made throughout our educational programs. (Para. 11)

Having briefly mentioned some of our many points of departure in this project of deep homecoming, I would like to suggest that Sri Lalita holds forth a strategic hint about how to proceed in an increasingly imperiled world in which icecaps melt and liberties vanish even faster.

The ancient stories tell us that when the demon Bhandasura was born of the ashes of destroyed love, Sri Lalita and her followers rode to battle with him on elephants, peacocks, horses, eagles, swans, and, in her case, on a chariot pulled by a lion. Music wafted forth from its turning wheels. When she appeared in the field, Bhandasura laughed at her. What was this soft, lovely creature doing here? How could she hope to stand against him, who had hurled even the powerful god-king Indra from his heavenly throne?

Sri Lalita did not deign to fight him on his own violent terms with his own destructive methods. Instead, she unleashed an arrow made of flowers. Its name was Kameshwari, an expression of sacred feminine power. Arcing unstoppably through the sky, it penetrated its target and dropped him with a mountain-shaking concussion. As she stood over her fallen opponent, Sri Lalita knew she could destroy him easily now, but she chose instead to revive him, but not in his ugly form as Bhandasura. No. Rather, she restored him to his original form, that of the divine being he had been before his decline to ashes and darkness: Kamadeva, the god of love and desire.

If you can't beat 'em, transform 'em.

Sri Lalita bears within one of her many names an emphasis on the number three. For example, she holds in her hands the sources of three capacities or powers: will, wisdom, and action. The documentary film *A Fierce Green Fire* showcases all three as the first major documentary on the environmental movement, one of the oldest and most successful movements for cultural transformation. The film takes us through five decades of environmental activism on a global scale. Drawing on interviews, archival footage, and the scientific expertise of biologist E.O. Wilson, among others, the film touches on the early conservation movement, the fight against pollution in the 1970s, the often risky work carried out by Greenpeace to protect endangered sea life, the struggle against rainforest-depleting globalization, and twenty-five years of uphill steps taken to halt the ravages of climate change, recently described by Bay Area activist Rebecca Solnit as a sustained act of unnamed violence.

The film takes its name from a transformational moment in the life of Aldo Leopold. In his book *A Sand County Almanac* Leopold (2001/1949) describes how, having just shot a wolf,

> We reached the old wolf in time to watch a fierce green fire dying in her eyes. I realized then, and have known ever since, that there was something new to me in those eyes—something known only to her and to the mountain. I was young then, and full of trigger-itch; I thought that because fewer wolves meant more deer, that no wolves would mean hunters' paradise. But after seeing the green fire die, I sensed that neither the wolf nor the mountain agreed with such a view. (p.11)

As a result of this encounter Leopold became a lifelong advocate of what he called the land ethic: "The land ethic simply enlarges the boundaries of the community to include soils, waters, plants, and animals, or collectively: the land" (p. 171).

> That land is a community, is the basic concept of ecology, but that land is to be loved and respected is an extension of ethics. A land ethic, then, reflects the existence of an ecological conscience, and this in turn reflects a conviction of individual responsibility for the health of land. We can be ethical only in relation to something we can see, feel, understand, love, or otherwise have faith in. (Leopold, 2001/1949, p. 171)

Thomas Berry (1999) would agree. When he was a boy, his family moved near a creek flowing by a meadow:

> It was an early afternoon in May when I first looked down over the scene and saw the meadow. The field was covered with lilies rising above the thick grass. A magic moment, this experience gave to my life something, I know not what, that seems to explain my life at a more profound level than almost any other experience I can remember (Para. 1).

This early experience, it seems, has become normative for me throughout the range of my thinking. Whatever preserves and enhances this meadow in the natural cycles of its transformation is good; what is opposed to this meadow or negates it is not good. My life orientation is that simple. It is also that pervasive. It applies in economics and political orientation as well as in education and religion and whatever (para. 3).

He adds:

> We might think of a viable future for the planet less as the result of some scientific insight or as dependent on some socio-economic arrangement than as participation in a symphony or as renewed presence to the vast cosmic liturgy. This insight was perhaps something that I vaguely experienced in that first view of the lilies blooming in the meadow across the creek (para. 22).

"Cosmic liturgy" recalls the scientific-poetic teachings of Brian Swimme, of course, who knew Berry and whose demonstrations of the mystery and beauty of the universe not only win awards but invite us to feel at home in the starry cosmos

The reverential tone of Leopold and Berry and Swimme remind me of Alice Walker's. In an essay she wrote:

> What I have noticed in my small world is that if I praise the wild flowers growing on the hill in front of my house, the following year they double in profusion and brilliance. If I admire the squirrel that swings from branch to branch outside my window, pretty soon I have three or four squirrels to admire…And then, too, there are the deer, who know they need never, ever fear me (Walker, 1988, p.189).

All these voices represent a legacy of love for a world in decline, a world that cannot recover without a foundational change in collective consciousness away from numbness and disregard toward a deeper recognition of our innate caring for the things around, below, and above us. As Annie Dillard expressed this caring in her book *Teaching a Stone to Talk:*

> In the deeps are the violence and terror of which psychology has warned us. But if you ride these monsters deeper down, if you drop with them farther over the world's rim, you find what our sciences cannot locate or name, the substrate, the ocean or matrix or ether which buoys the rest, which gives goodness its power for good, and evil its power for evil, the unified field: our complex and inexplicable caring for each other, and for our life together here. (Dillard, 1982, pp. 19-20)

And so we gather to consider reverence for life and planet in the rising light of Earthrise, the anticipatory mythic image, perhaps, of a just, peaceful, and nature-loving civilization to be assembled from the ground up out of many soulful centers, one of which, perhaps, is here.

The Dynamic Unity of the Opposites: Haridas Chaudhuri's Integral Method and Higher Education

Joseph L. Subbiondo[1]

Abstract: This article focuses on Haridas Chaudhuri's methodological principle known as *Integral Dialectics* and its related principle of the *dynamic unity of the opposites*, as an essential aspect of his unique model of integral education. Integral Dialectics is a methodological principle which is informed by the integral ontological principle asserting that human psyche and cosmological principles on the whole are interrelated and interdependent, and that holistic knowledge of reality presupposes a holistic and integrated psyche. Integral dialectics is a process of reconciliation of what appears to the mind as polarized conceptual opposites and engaging the totality of human experience, the whole spectrum of human consciousness, and educating the whole person beyond the dualistic rational methods of Western education.

Key Words: Haridas Chaudhuri; Integral Education; Integral Dialectics; Integral Philosophy.

Soon after Haridas Chaudhuri's death in 1975, members of the Cultural Integration Fellowship, the parent organization of CIIS, along with faculty and staff of the California Institute of Asian Studies (as CIIS was known then) edited a collection of essays that draws upon Dr. Chaudhuri's many recorded lectures. The collection, entitled *The Evolution of Integral Consciousness* (Chaudhuri, 1977), reflects the broad range of Dr, Chaudhuri's scholarship: it includes chapters on several academic disciplines including education, history, philosophy, psychology, and science. I will focus my attention on a chapter entitled "Methodology" because in it, Chaudhuri discusses his unique method and dialectic and how they inform his vision for, and design of an integral education. He explains in detail how the Indic principle of "the dynamic unity of the opposites," a concept contrary to Western logic, is an essential part of his unique model of integral education.

The chapter begins with Chaudhuri's expansive vision of integral education—an education inspired by Sri Aurobindo's integral yoga; an education rooted in the notion of an integral universe; and an education developed without precedent in the United States. Haridas

Chaudhuri's integral education grew out of his deeply held practice of integral Yoga, as he claims:

> Yoga … literally means unity and control. It signifies the union of man with God, of the individual with the universal reality, of each with ALL of existence… But Yoga also means control, that is to say, appropriate self discipline. [Yoga] does not stand for any rigidly fixed rule, to which all should conform. …The important thing is that every individual should have the opportunity of growing from the root of his own being, following the bent of his own nature, along the lines indicated by his own physical make-up towards the full flowering of his individuality as a unique creative centre of the cosmic whole. (Chaudhuri, 1965, pp. 21-22)

Dr. Chaudhuri integrates this framework into his philosophy of education. He states:

> The more we understand the essential structure of the universe as a whole, the more we gain insight into the structure of man. The obverse is also true. The more we understand the essential structure of man, the more we gain insight into the unfathomable mystery of Being. (Chaudhuri, 1977, p.85)

Dr. Chaudhuri maintains that in the complexity of human nature, like in the complexity of the universe, we will discover the "dynamic unity of all opposites" (p. 85). He notes that the "The path leading to this insight [the dynamic unity of the opposites] may be described as integral thinking" (p. 85). For Dr. Chaudhuri, "The method of integral thinking represents a dynamic integration of the scientific, phenomenological and dialectical methods of the West and the self-analytical, psycho-integrative, non-dual value disciplines of the East" (P. 85). In this one comprehensive statement, he provides us with as concise a summary of his concept of integral education as any he or anyone has written.

In Chaudhuri's view, "Our knowledge and civilization began with the unity of all disciplines … and that [original discipline of unity] was Philosophy" (p. 91). He points out that as scholars studied and created an increasingly wider range of knowledge, they greatly expanded the number and role of disciplines and sub-disciplines. He concludes that the growth of the disciplines has made us realize that we need to reduce their number through synthesis. He suggests: "Now again [as in the past] we are feeling the need for harmonizing all the fragments of knowledge into a comprehensive synthesis, which would be a very sophisticated kind of unity" (Chaudhuri, 1977, p. 91).

However, while designing an education that draws many disciplines together and offers a holistic view of knowledge, Chaudhuri recognizes that the disciplines are valuable if they are not excessive in number. He acknowledges that some academic disciplines, for example philosophy, history, and psychology, are needed to for us to have a substantial understanding of the whole of knowledge. He writes:

> All disciplines of human knowledge are in essence organized systems of ideas or verbal propositions. They represent abstractions of thought from the concrete fullness of the real,

> designed to fulfill some definite goal or purpose of life—whether intellectual, ethical, religious or political. (Chaudhuri, 1977, p.87)

Chaudhuri recognizes that higher education has moved beyond the point where one method can be applied effectively to all areas of human experience and to all disciplines, because each area and discipline requires its own method. Yet, he insists that no matter how well advanced an area or a discipline may be, it presents a limited and fragmented view of the whole. He maintains that no ideological scheme or discipline could mine "the multidimensional fullness of the universe" (p. 87). He contends:

> There are some universal truths which from the standpoint of every discipline of knowledge can be conceptualized, can be expressed in terms of that particular discipline. The same truth can be translated into every discipline of knowledge… (Chaudhuri, 1977, pp. 90-91)

Thus, even though the disciplines have been separated, Chaudhuri acknowledges that they continue to remain interrelated. For example, he notes "…in the study of psychology, the behavior pattern of a human being dynamics can hardly be fully understood without reference to the conscious and unconscious motivation dynamics of man acting as an individual or as a group" (Chaudhuri, 1977, p.86).

Chaudhuri advances the idea that "Since a thought system is then essentially a map, to be distinguished from the territory of the real, it is unthinking confusion to equate it with reality itself" (p. 87). Here he draws on the core principle of the General Semantics Movement: "The map is not the territory." In the *Epilogue* to *The Evolution of Integral Consciousness,* Dr, Chaudhuri (1977) cites the work of the founder of this movement, Alfred Korzybski (1879-1950) who in 1933 published a very influential book, *Science and Sanity: An Introduction to Non-Aristotelian Systems and General Semantics* in which, as the title suggests, he challenged Aristotelian logic and the foundations of Western thinking. Given the impact of this book (Korzybski , 1933) on Haridas Chaudhuri's approach to knowledge, I will comment on it.

I was delighted to see this reference because early in my studies of linguistics, I was and continue to be impressed by Korzybski and the General Semanticists. Korzybski was born in Poland, educated at Warsaw University of Technology, and migrated to the US. He argued that we are confined by the structures of our language and thought, and we do not have direct access to reality—even though we often think so. We only have abstractions of reality. Typically, we confuse our perceptions (*the maps*) with reality (*the territories*). Moreover, our misperceptions regarding language and thinking mislead us regarding the nature of facts. In his first book, *Manhood of Humanity* (Korzybski, 1921), he explored his notion of the human being as the "time binder" species capable of passing on knowledge to future generations of the species; and in doing so, changing culture. Korzybski's work became the basis for the General Semantics Movement, and following the publication of *Science and Sanity* (Korzybski, 1933) he lectured widely at universities throughout the US.

Korzybski and the General Semanticists taught a variety of techniques to help people realize how they misunderstand "facts" and confuse their perceptions with reality. For example, he taught a technique he referred to as *indexing* in which we assign each individual a number in order to avoid generalizations about people (e.g. Mary 1, John 2, etc) and *dating* in which we identify each person by a date to remind us that people change from moment to moment. Korzybski was well received by many of Haridas Chaudhuri's contemporaries including Isaac Asimov, Gregory Bateson, William Burroughs, Kenneth Burke, Buckminster Fuller, Samuel I. Hayakawa, Robert A. Heinlein, Alvin Toffler, Alan Watts, and Benjamin Lee Whorf.

Chaudhuri (1977) believed that "the universe is the ground and the comprehensive unity of all thought systems without itself being a determinant system" (P. 87), and that this idea leads to a "non-dogmatic and non-doctrinaire attitude, to a genuine respect for opposite viewpoints and to a synoptic vision of the universe in its integral fullness". He states that a " closed mind is the worse enemy of balanced growth" (p. 88) and that "True respect for others is born of the vision of truth in others" (p. 88).

He notes:

> When we focus our love and devotion on one thing – one particular creed, country or conceptual system – as the only ultimate reality, our psychic energy becomes sharply polarized. Attachment and advocacy are bestowed upon the beloved object, the deity. The impulses of hostility and disgust are forcefully directed against any opposition, the menacing evil. Thus a love/hate syndrome develops within the psyche. It corresponds to the God/devil dichotomy in the outside world. (Chaudhuri, 1977, p. 89)

Chaudhuri connects integral thinking to his notion of the identity of the opposites:

> Integral or non-dichotomous thinking rejects both the metaphysical as well as the theological interpretation of dichotomies of thought in absolute terms. Dualities are neither sharp divisions in reality nor irreconcilable opposites of value and disvalue… [but] in essence complementary half truths clamoring for reconciliation in unifying categories of comprehensive thinking. (Chaudhuri, 1977, p. 90)

Chaudhuri explains that connecting ideas with their opposites is important for advancing education because it brings ideas into sharper focus. He recognizes that the identity of the opposites, contrasts with basic assumptions of Western thinking, and that it is antithetical to Aristotle's Law of the *excluded middle* which holds that the opposites cannot allow for a middle, or any possibilities in-between. Chaudhuri strongly maintains that denying a middle ground between contradictories leads us to many dichotomies. He notes:

> … in Eastern culture, which has been predominately mystical and spiritual, it is just the opposite – the doctrine of the middle path is emphasized. The discovery of that middle is the secret of synthesizing opposites. Everywhere in actual life we find that opposites meet, and there is always a middle ground which it is our task to discover, because that gives us the secret of balanced growth or integrated self-development. Also, this is the secret to attaining an integral vision of the total truth. (Chaudhuri, 1977, p.90)

The term *Dialectic* has its origins in ancient Greek rhetoric, and it traditionally refers to a method of reasoning and/or discussion. In the 18th and 19th centuries, Kant (1724-1804) used the term to refer to discourse dealing with apparent contradictions, Hegel (1770-1831) referred to *thesis* and *antithesis* merging into *synthesis*, and Karl Marx (1818-1883) referred to the contradictions in politics and history due to material needs. Chaudhuri (1977) defines *integral dialectics* as "a methodological postulate of the integral world view. It is also the most essential technique of integral self-actualization or the full flowering of the human potential (p. 92).

Drawing on Hegel's work, Chaudhuri (1977) maintains that "The human mind's quest for truth is the movement of consciousness from the dynamic tension between opposites (thesis and antithesis) toward more and more inclusive synthesis embracing the wholeness of Being" (p. 93). He cites the extensive pioneering work of Hegel and Marx in Western philosophy to develop dialectical idealism and dialectical materialism respectively. However, he concludes that both dialectical methods are limited because they are exclusively grounded in Western rationalism with its bias on dualistic logical thinking.

Chaudhuri (1977) proposes an integral dialectics that includes more than logic as it begins "with the indivisible totality of human experience, with the whole spectrum of human consciousness, of which sensory experience and intuitive apprehension of the whole are two inseparable poles" (pp. 99-100). Alluding to Marx, Chaudhuri (1977), argues that…

> No matter to what extent the economic and political structure of a society be drastically overhauled, until and unless there is a real transformation of inner consciousness – a genuine change of heart, as Gandhi would say, exploitation and injustice can hardly be eliminated from society. (p. 95)

Chaudhuri (1977) insists on a more holistic view that "Human problems are of a psychological, ethical, and intellectual nature as well as economic and political" (P. 95).

He advances that "Integral Dialectics focuses on the most fundamental dualities of life and reality –matter and mind, nature and spirit, world and God, the phenomenal and the transcendental, etc." (p. 95). For him, "The essence of Integral Dialectics consists in reconciling such polarities into the kind of comprehensive unity of which they are seemingly conflicting, but really complementary self-expression" (p. 96). Such ideas are unprecedented in the history of U.S. higher education.

In the final part of the chapter, Chaudhuri offers an illustration of his integral dialectics by focusing on the philosophical search for truth and the spiritual quest of self perfection. In making his case for unifying the opposites, he was very aware of the complexity of the task. It is a very heavy lift in Western higher education; but at the same time, he clearly recognizes that U.S. and European colleges and universities need to integrate ancient Eastern wisdom into their contemporary models of education.

The many advances in knowledge resulting from the empirical method of the 17th century Scientific Movement, the Age of Enlightenment, certainly attests to the value of a dualistic model of education. Nonetheless, the fact that it has dominated higher education to the point that it has discouraged, if not dismissed, the consideration of any alternative model has limited the capacity of Western higher education. I fully agree with Robert Bellah’s (2006) description of the defenders of dualism whom he refers to as *enlightenment fundamentalists*, and his complaint that they have prevented free and open inquiry into the nature of knowledge. Consequently, it has been and continues to be extremely difficult in US higher education for a university to have academic credibility and maintain institutional accreditation while challenging the dualistic educational paradigm of the academy.

We should be grateful to our regional accrediting body, the Western Association of Schools and Colleges (WASC) for accrediting CIIS for the past 45 years despite CIIS’ non-conventional acceptance of non-dualistic ways of knowing. Given the resistance in American higher to non-dualistic studies, it is remarkable that CIIS not only has survived, but that it is thriving with increasing appeal to more and more students. In fact, I am convinced that CIIS succeeds today precisely because it advances a non-dualistic model of education, or what we could refer to as *Post-Enlightenment Higher Education.* CIIS faculty and students consistently indicate that it is our alternative educational model that attracts and retains them. Moreover, our integral model of study and practice as promoted by our faculty, students, and alumni are contributing to an emerging receptivity in the U.S. to *Post-Enlightenment Higher Education.*

Dr. Chaudhuri insightfully saw half a century ago what many are beginning to realize today: namely, that higher education needs to embrace integral thinking and education. He passionately believed that “… only when we shall experience this transition from the dualistic… thinking to the non-dualistic way of seeing everything, can the ideal human society or the global society be founded.” (Chaudhuri, 1977, p.82)

Integrative Research: Integral Epistemology and Integrative Methodology

Bahman A.K. Shirazi[1]

Abstract: This article provides an introduction to integral epistemology and integrative methodology through a discussion of basic ontological principles of integralism and their implications for developing integrative approaches to knowledge. After a review of classification of approaches to research, integration is introduced as a research strategy that can be applied to various modes of scholarship and within specific research methods. It is argued that the current dichotomy between qualitative and quantitative research methods may be reconciled by showing that various research methods belong to a wide spectrum of methodologies that correspond to an integral epistemological gradient. Lastly, three basic strategies for integrative research: Integral Dialectical Synthesis, Unity-in Diversity, and Analytico-Synthetic Integration are discussed.

Key Words: Haridas Chaudhuri, Integral Dialectics, Integral Epistemology, Integration, Integrative Methodology, Research Methodology, Sri Aurobindo.

> The holistic impulse is the integrative urge of our total being in which instinct and intellect, passion and reason, impulse and law, emotions and thought, self and society, psyche and cosmos, intermingle in an all-embracing organic relationship. The great challenge of our time is to restore this organic relationship by sound educational methods.

Introduction

An integral or integrative approach to research methodology is based on an integral epistemology, which is in turn informed by integral ontological assumptions and principles. Integral ontology holds that reality is multidimensional, and thus avoids the extreme positions that hold either matter to be real and spirit an illusory epiphenomenon in the case of materialism, or spirit to be the only legitimate reality and matter an illusion, as the case has been with many spiritual philosophies. In the integral framework of Sri Aurobindo both spirit and matter are considered real (Sri Aurobindo, 1970).

Several ontological and epistemological tenets are foundational to an integrative framework:

[1] **Bahman A.K. Shirazi**, PhD, is archivist and adjunct faculty at the California Institute of Integral Studies (CIIS). For the past three decades he has studied, taught, and worked in a number of academic and administrative roles at CIIS. His main academic focus has been in the areas of integral yoga and psychology in which he has published a number of book chapters and articles and presented at a number of international conferences. He organizes an annual symposium on integral consciousness at CIIS. bshirazi@ciis.edu

SOME RIGHTS RESERVED

- Reality is a multidimensional whole. All diversified appearances are expressions of an underlying unified whole.
- Experience of holistic truths presuppose and result from an integration of all levels of consciousness; i.e., unconscious, subconscious, conscious, and supraconscious.
- Highly integrated consciousness is characterized by transcendence of the dualistic framework characteristic of mentally dominated consciousness.
- At highly integrated levels of consciousness the duality between subject and object of experience disappears.
- Duality reflects the polarized structure of reality; *Dualism*, however, is the natural fallacy of the human mind that results in perception of opposites as essentially independent, rather than complementary aspects of reality.
- Symbolic abstractions (such as images, language and thought etc.) are not capable of representing the whole reality.

In the post-renaissance modern era there has been a firm separation between religion and science in the West. Science is primarily a method of investigation of material phenomena, and its findings are at best hypotheses and theories that have not been empirically rejected based on available evidence (Popper, 1959/2002). In other words, science is a method of knowing, rather than a body of knowledge. However, as many recent thinkers (Tart, 2009; Sheldrake, 2012) have noted, an unofficial fusion of materialism and science has produced a dogmatic belief system known as *scientism* which relies on either a conscious or an unconscious assumption that material reality is the only reality, and that all other phenomena such as emotional, mental, and spiritual phenomena are evolutionary byproducts of matter and the nervous system.

Material monism holds the fundamental assumption that only matter is real. In this view the metaphysical, including spiritual, realities are either deemed to be figments of human imagination, subjective beliefs, or illusions of the mind. These subjective states are believed to be the source of bias or error and every attempt is made to isolate or eliminate them. Objective observations are the building blocks of information that produce scientific facts which must be replicable and thus reliable as the basis of firm scientific knowledge under all circumstances. The so called positivist view which began emerging in the middle of the19th century further sealed the scientific method by rejecting and excluding all metaphysics from science.

Many spiritual systems, in turn, hold that spirit is exclusively real, and matter is either entirely an illusion (e.g. *maya*), or is an extension or modification of spirit into space-time. Those worldviews that hold matter as being the only legitimate reality also subscribe to objective empiricism (knowledge by observation through sense-data) as the appropriate epistemological foundation for knowledge. They hold that objective observations of material phenomena, and testing and verification through empirical means are the appropriate approach to establishing valid knowledge. On the opposite end of the spectrum, subjective, immediate or direct knowledge of reality (knowledge by identity or gnosis) forms the basis for spiritual knowledge.

Integral philosophy holds that both matter and spirit are equally real and that there are multiple ways of knowing corresponding to various gradations of consciousness and reality. Spirit and matter are part of a wider spectrum of consciousness and Being that includes physical, subtle-physical, vital, and mental realms, as well as supramental and psychic consciousness, each with many gradations and nuances (Sri Aurobindo, 1999, pp. 89-247). These teachings on various parts of being and planes of consciousness are summarized by Dalal (2012) in terms of two systems, a concentric and a vertical system. The concentric spheres are comprised of the *Outer Being*, the *Inner Being*, and the *Psychic Being*, each of which has a threefold mental, vital, and physical constitution. The vertical structure ranges from the *Inconscient*, to the S*ubconscient*, and up to the *Superconscient* (which includes: higher mind, illumined mind, intuitive mind, overmind, and supermind).

This complex integral configuration of human consciousness has an epistemological implication; i.e., there are multiple levels of consciousness and thus multiple realities, and multiple ways of knowing. Based on the concentric system of Sri Aurobindo, it is possible to arrive at a simplified epistemological framework we may call an *integral epistemological gradient*. The *Outer Being* refers to our physical body and the five senses which interact with the external material environment. This is the domain of traditional or objective empiricism which is the basis of scientific methodology.

The *Inner Being* is the realm of subjective and subliminal consciousness and is potentially quite vast and multilayered. As consciousness is turned inward we might first encounter a layer that corresponds to what phenomenologists call essential structures of consciousness. Here our main method of knowing is subjective empiricism, or observation of the inner layers of consciousness right below the external forms. Deeper still, there is the realm of subtle physical and subliminal phenomena perceivable only through the subtle senses (e.g. clairvoyance, clairaudience). As we approach the *Psychic Being* we engage with what is known as knowledge by identity or immediate knowledge, also referred to as gnosis in mysticism. Here there are no more forms, gross or subtle, but pure meaning or direct knowing.

Whereas modern science stops at the level of objective empiricism, qualitative methods developed in the latter part of the twentieth century include the surface layer of subjective consciousness, and yoga and mysticism have long advocated gnosis or knowledge by identity. The integral epistemological gradient, in congruence with all-inclusiveness and multidimensionality principles, provides an inclusive framework that validates the relative positionality of all of the above.

The Methodological Spectrum

The impressive panorama of research methods available to researchers today is generally discussed in terms of two major categories: *quantitative* and *qualitative*. These two terms often stand at sharp contrast, or some degree of polarity, with respect to one another. The term *quantitative* readily reflects the nature of measurement strategies employed by such methods. The term *qualitative*, however, implies something more than just a non-quantitative, or less quantitative approach to measurement. It carries with it the disapproving attitude that qualitative researchers often show toward the methodological approaches and epistemological span of the adherents of the "received view" (the traditional positivist scientific epistemology). A similar attitude is held by the majority of statistically oriented, hard scientists towards their qualitatively oriented colleagues.

This paper offers some suggestions that are intended to help reconcile this existing polarity by introducing the *spectrum approach* to research methodology. I will also discuss briefly the nascent field of integrative research methodology. It is my hope that further light may also be shed on some general ways in which research methods are understood and classified.

Classification of Research

Before introducing the *spectrum* approach to research methodology, I will make some preliminary clarifications regarding the ways in which research methods are typically classified. Although there is general clarity regarding the distinction between research methods and research design in most texts, the criteria according to which research methods themselves are classified are to some extent implicit.

In general, research methods may be distinguished as *empirical* and *non-empirical*. Empirical methods employ diverse means of observation and data gathering, descriptions, analyses and interpretations. Natural sciences employ *quantitative* methods as their preferred choice. Human and social sciences make use of *quantitative*, *qualitative* and *mixed methods*, as well as non-empirical methods. The humanities rely for the most part on non-empirical methods such as hermeneutics (text interpretation), literary, or logical analyses.

Another way to classify research is in terms of the number of participants (sometimes referred to as co-researchers or subjects) involved in a specific study. The term *nomothetic* (norm-based) refers to studies that involve a sample of "subjects" often divided into sub-groups as required by a given research design. Average scores computed through statistical procedures are typically the basis on which generalization are made to a larger population using inferential statistical methods. The goal of normative research is to establish descriptive, correlational, or causal relationships that are generalizable to formulate descriptive or explanatory 'laws' within specific theoretical frameworks.

This epistemological ideology is much influenced by the modernist, scientific world view, a tradition that is interested in inferring 'natural' or 'universal' laws (believed to govern the universe, yet ordinarily hidden from the naive observer) by means of generalizations through inductive or hypothetico-deductive procedures. Generalizations are made based on results obtained from samples and by means of statistical inferences. Qualitative epistemologists and methodologists have questioned the appropriateness of this approach to the social sciences in general, and to psychology, in particular.

The *idiographic* method refers to studies that involve only one subject/participant as in single-case studies. An early advocate of this method was Gordon Allport (1962) who drew attention to the individual uniqueness principle and its importance in psychology. Ideographic methods are generally acknowledged as valid methods of study, although their low external validity (power of generalization) is always pointed out as a limitation.

Research may also be classified according to the disciplinary framework or approach to the subject matter at question. *Single-discipline, eclectic, comparative, interdisciplinary,* and *transdisciplinary* methods belong to this system of classification. The eclectic approach draws on various fields or areas of human knowledge. Its goal is to broaden the scope of inquiry beyond pre-established disciplinary limitations. The comparative method involves contrasting two or more perspectives or approaches to a given topic or subject matter. Comparative methods often evaluate underlying assumptions and presuppositions adopted by alternative or diverse means toward the same end. The *interdisciplinary* approach involves attempts to bring together related, yet distinct fields of knowledge. Its goal is to shed light on a specific area or subject matter in further depth, using the knowledge base and methodologies employed by two or more disciplines. Interdisciplinary methods can be instrumental in studies that involve multidimensional subject matter under investigation. For example, the human brain is a highly complex phenomenon the study of which requires in-depth knowledge of anatomy, neurology, molecular biology, psychopharmacology, and biochemistry, to name a few. In some cases all of the disciplines involved use the same basic methods (e.g. quantitative / experimental or quasi-experimental). In other instances, interdisciplinary approaches are not as easy to establish. For example, the study of human menstrual cycle may require collaboration among several disciplines such as gender studies, biology, cultural anthropology, developmental psychology, and endocrinology. Here, it is not easy to readily reconcile methods adopted by these individual disciplines in isolation.

Sometimes multidisciplinary approaches result in the creation of a new discipline altogether, such as psychoneuroimmunology, which results as the confluence of psychology, neurology and immunology, not just toward addressing a certain research problem, but as an entirely new discipline. *Transdisciplinarity* is a mode of scholarship that crosses or transcends disciplinary boundaries to create a holistic approach. It utilizes concepts or methods that were originally developed by one discipline, but are used by others.

Research methods may also be classified in terms of the strategic rationale or intended epistemological goal. It is in this sense that integrative methods are best understood. Research strategies include analytic, synthetic and integrative approaches. The above information is summarized in Table 1.

Table 1: Classification of Research Methods

Classification Criteria (levels of inquiry)	**Category**	**Category**	**Category**
Ontological/ Epistemological	**Empirical**: relies on observation. Data may be qualitative or quantitative, from field or laboratory. Methods: Experimental, Quasi-Experimental Descriptive (non-experimental)	**Non-Empirical**: Text or other media based. Examples: Historical/archival Hermeneutic (text/content analysis) Secondary use of empirical data	
Epistemological/ Methodological/ Source of data	**Qualitative** Rarely uses numbers as sources of data or for analysis of data. Data may be empirical	**Quantitative** Uses operationalized variables and scales of measurement (nominal/ ordinal/ interval/ratio)	**Mixed methods** Employs a combination of qualitative and quantitative approaches or sources of data.

	(based on observation) or non-empirical (text-based) and is primarily descriptive.	to convert concepts to numbers to perform mathematical/ statistical analyses of data.	
Number of participants	**Idiographic**: focuses on a single individual profile and emphasizes uniqueness. Data could be qualitative (descriptive) or quantitative (descriptive statistics/ demographics).	**Nomothetic** (normative approach): uses inferential statistical methods (sampling and generalization).	
Mode of Scholarship	**Single discipline based** Methods are specific to disciplinary boundaries.	**Eclectic**: non-methodical use of knowledge or information beyond one's area of specialization. **Comparative**: use of two or more disciplines to address the research problems via compare/contrast method.	**Inter/multi-disciplinary**: two or more disciplines/ often involves methodological fusion and may lead to creation of new disciplines. **Transdisciplinarity** is a mode of scholarship that crosses disciplinary boundaries to create a holistic approach to knowledge.
Process/Strategy	**Analytic**: breaks down wholes to study components.	**Synthetic**: synthesizes components to arrive at wholes.	**Integrative**: seeks integration of human knowledge. May use analytic, synthetic, analytico-synthetic, or dialectical approaches during phases of research while embracing various modes of scholarship.

It is important to keep in mind the difference between mode of scholarship and research strategy when it comes to understanding what integrative research implies. An integrative strategy can be employed in any mode of scholarship.

Integrative Methodologies

Haridas Chaudhuri articulated the basic principles of integrative methodologies in his article titled *Integral Methodology*, published posthumously as a chapter in *Evolution of Integral Consciousness* (Chaudhuri, 1977). A key requirement for integral methodology is adaptability and responsiveness to evolutionary demands. The present section is titled 'integrative methodologies' as it would be inconceivable to postulate a single methodological framework that is capable of fulfilling this basic requirement. According to Chaudhuri (1977): "Integral thinking recognizes that one uniform methodology cannot be blindly applied to all areas of human experience and to all disciplines of knowledge" (p. 85).

However, certain broad guidelines could be useful for practical applications. Marx (1978, pp. 78-81) suggested the following summary of epistemological principles that convey the basic postulates of integral epistemology as envisioned by Haridas Chaudhuri:

- Truth is more than conceptual.
- The basic structure of reality is that of unity-in-diversity: it is nondual and has a polarized structure, and therefore is a unity of opposites.
- The basic nature of reality appears to be comprised of multi-leveled continuums and can be perceived from a multiplicity of perspectives.
- An evolution of integral consciousness is taking place on an individual and collective level.

A basic function of an integrative method is to reconcile apparently conflicting expressions and dichotomies**.** To this end, integral methodology proposes and utilizes the doctrine of the identity of opposites. Socrates called this doctrine the law of the golden mean; the Buddha taught it as the doctrine of the middle-path. In the Taoist tradition opposites are considered to be complementary, not contradictory to one another. In short, truth is to be found half way between the two extremes.

One of the general goals of integral epistemology would be to reconcile the dichotomy between the quantitative and qualitative approaches. Although the terms empirical and quantitative research are closely associated, they are not synonymous. In fact, almost all empirical/quantitative studies make use of both quantitative and qualitative steps in their procedures. A typical quantitative study starts with certain qualitative concepts that are then operationalized and converted into concrete and measurable terms called variables or factors. These operationalized terms are measured using one or more of several scales of measurement such as nominal, ordinal, interval, and ratio scales and their associated statistical tests. Nominal and ordinal scales are less quantitative where numbers designate symbols or categories and require non-parametric statistical tests; whereas, interval and ratio scales use numbers arithmetically and require parametric statistical procedures. Most importantly, when the statistical analyses are performed, the results that are typically stated in numerical terms must subsequently be interpreted in qualitative terms and eventually explicated in the theoretical framework of the study, or the background literature.

Various research designs differ in the degree to which they involve qualitative and quantitative phase or procedures. A first step in the reconciliation of qualitative and quantitative methods involves deconstructing the qualitative-quantitative dichotomy and presenting the diverse range of research methods in terms of a spectrum. Such a spectrum will have at one extreme end highly quantitative methods involving parametric statistics and the use of the ratio and interval scales of measurement. It is important to remember here that even such methods involve certain qualitative steps. All observations start with meaningful terms that are operationalized for measurement purposes. Numerical analyses are only an intermediate step in the overall process and are merely an aid to logical thinking and analysis. Results of even the most quantitative studies must be interpreted and explicated in terms of meaningful language of everyday life.

Parametric > Non-Parametric > Mixed Methods > Ethnographic > Hermeneutic > Heuristic

Quantitative >> **<<Qualitative**

Moving along the spectrum, the next group of methods are those employing non-parametric designs and nominal and ordinal measurement scales. In such studies numbers are not strictly arithmetic and function as an aid in the process of analysis. Qualitative steps in such studies are required for final explications into a language that is non-quantitative.

This group is followed by mixed quantitative/qualitative approaches which employ a combination of sources of data, research methods, or both. Qualitative methods that involve some degree of quantification follow next. Examples are content analysis using computerized or other coding systems, or certain ethnographic methods that make use of numbers or categories. At the other end of the spectrum are the "soft methods" such as the heuristic, the phenomenological and other descriptive methods that make little or no use of numbers or categories and are instead interested in underlying essences or structures of knowledge.

On another level, while embracing the full spectrum of traditional research methods, an integrative framework may include eclectic, comparative, or interdisciplinary modes of scholarship as part of the overall design of a given study. For example, a certain study may utilize the integrative approach as its strategic rationale, and yet employ an interdisciplinary mode of scholarship. On the other hand, a traditional investigation may be designed to incorporate an integrative framework. For example, a phenomenological investigation may follow the traditional steps and reveal underlying essences as phenomenological studies do typically, and take further steps to integrate these essences; i.e., reconcile any possible dichotomous essences that may reveal themselves in the intermediate stages of the study.

The following are some of the guidelines that Haridas Chaudhuri (1974) suggested for building-in an integrative rationale into a traditional study:

- Integrative approaches involve theses that are established by either empirico-rational, or critico-dialectic methods.
- Theses are not merely rhetorical expressions of opinion, but are developed logically through balanced examination of opposite viewpoints.
- Theses should be broad-based upon empirical and phenomenologic grounds, relying on accumulated relevant data.
- Theses should contain a critical element; a critique of one's fundamental concepts and a priori assumptions. Theses should also contain a dialectical element; a balanced examination of opposite viewpoints, bringing out both positive and negative [proactive and reactive] features with an intention to arrive at comprehensive syntheses.

- An attitude of non-dogmatic inquiry is imperative in integrative research. Care should be taken to avoid searching for reasons, or empirical data to support foregone conclusions.

Research Designs for Integrative Research

On the epistemological level, integrative methods attempt to arrive at holistic knowledge. Integral methodologies could utilize quantitative, qualitative or mixed methods in the overall design of a study. The mode of scholarship of an integrative approach could range from disciplinary to cross/multi/trans-disciplinary. It is important to emphasize that integration pertains to research strategy, rather than mode of scholarship or a methodological choice.

Three general designs are suggested here for utilization in integrative studies. These are: *Integral dialectical synthesis, unity-in-diversity,* and *analytico-synthetic integration.*

Integral Dialectical Synthesis

Also known as *integral dialectics* (Chaudhuri, 1976), dialectical synthesis is a method of reconciling apparently dichotomous concepts or themes to arrive at higher orders of reality through a dialectical process similar to Hegelian dialectical method. However, integral dialectics is not merely an abstract process and involves intuitive, experiential, somatic and practical understanding as well. This design is generally useful when the intention of the researcher is to reconcile dichotomous concepts and arrive at syntheses on a more holistic level of understanding.

One way to achieve this goal is to engage in dialectical reasoning, as in the case of the traditional Hegelian dialectical method. Another approach may involve the examination of extreme viewpoints regarding a particular subject matter, and the establishment of a spectrum of perspectives or the middle ground between the two extremes. A third approach involves reconciliation of opposites by finding view points or perspectives from which it could be shown that the opposites are in fact complementary.

Unity-in Diversity

Another general integrative design involves the demonstration of the underlying unity of a diverse set of theories, world views, or perspectives. This method involves an in-depth investigation of the research question within each world view or perspective to reveal the underlying structures or the essential assumptions of the question as the initial step. The next step involves a comparative component that demonstrates the similarity or identity of the underlying essences discovered independently. For example, one may examine several different world views such as Eastern or indigenous traditions and unveil implicit or explicit ecological principles embedded in these traditions. Then by pulling together these essential principles, one could develop an integral ecological model.

Analytico-Synthetic Integration

The goal of this procedure is to create parsimonious knowledge by, first, analyzing a large number of concepts, themes, or theories about a certain topic into their main constituent factors, and then re-synthesizing these factors into simplified models that not only reflect the common original themes, but reflect new knowledge as well. For example in a previous study, the present author surveyed four Eastern spiritual traditions as well as several Western schools of psychology on the topic of ‘self’. It turned out that in many traditions the self is understood at three principal spheres (egocentric, psychocentric, and cosmocentric) and this suggested that self in an integral psychological framework may be understood on the basis of the interaction of these three spheres of selfhood (Shirazi, 1994).

The method of analytico-synthetic integration includes two dimensions: conceptual and pragmatic. Conceptually, analytico-synthetic integration restates the principal characteristics of an integral approach; however, it further emphasizes the analytical component. The term synthesis denotes construction and suggests the necessity for some sort of structure. In the dialectical process, for example, a synthesis is constructed from the interplay of the thesis and antithesis. The resultant synthesis in turn becomes a new thesis, laying the foundation for another antithesis.

The word analysis refers to de-structuring or breaking down into components. This process is as essential to the process of integration as is synthesis. Almost endless examples of de-structuring or decomposition in the natural processes might be given; in fact, release of energy is possible only through de-structuring into components that regroup at a lower level of energy, thus releasing some surplus energy. On the other hand, synthesis requires additional energy. It is assumed here that analysis and synthesis are not diametrically opposed or antithetical to one another; rather, they are complementary opposites that are essentially inseparable. As such they are the polar modes of integration, thus allowing simultaneous unification and diversification, as well as creation of new forms in natural processes.

In logic, the deductive principle is an example of the analytic process, while the inductive principle represents synthesis. It is known in logic that a deductive operation, as in a syllogism, does not yield new knowledge; i.e., the conclusion is already implied in the major premise. However, it is possible through induction to arrive at a conclusion that cannot be inferred from any of the premises in isolation. In Aristotelian logic, though often not mentioned, the deductive and inductive processes were considered as two half-circles. Although deduction does not yield new knowledge, it helps unveil premises that can be utilized in inductive reasoning to arrive at new premises. The two half-circles as a whole comprise the full circle of logic.

Although there are numerous ways to design integrative research methods and algorithms, all integrative methodologies strive to arrive at parsimonious, multidimensional, non-dual, and holistic knowledge. Integral epistemology may employ divergent and convergent thinking, inductive and deductive reasoning, rational or intuitive understanding as means toward attaining its goal, the integration of human knowledge. In doing so, it makes use of new and creative or already established ways of conducting research and inquiry, while remaining evolutionary, non-dogmatic, open and self-transcending.

Positionality as Knowledge: From Pedagogy to Praxis

Sara Maria Acevedo, Michael Aho, Eri Cela, Juei-Chen Chao,
Isabel Garcia-Gonzales, Alec MacLeod, Claudia Moutray, Christina Olague[1]

Abstract: In this article, the authors will draw from their work in the Integral Teaching Fellowship Program at CIIS, and from their interactive session in the 2014 CIIS Founders Symposium on Integral Consciousness to better understand the epistemological relevance of positionality in integral education and critical pedagogy. A critical approach to pedagogy (drawing from theorists such as Paulo Freire and bell hooks) encourages students and educators alike to recognize their social positionings and reflect on how the institutionalization of their social identities (such as the expert, the genius, the marginalized, the disabled) not only inform the lenses through which they view the classroom, but also influence how they participate in the classroom. By employing an integral learning model (variety of modalities), a learning community is transformed into a dynamic positioning field, in which students and educators interact and co-create knowledge beyond their habitual or institutionally imposed positionings. Supported by our own experiences as integral educators in training, we conclude that developing critical reflection, including previously subjugated perspectives, and gaining the ability to reposition oneself maximizes learning opportunities.

Keywords: Critical pedagogy, integral education, positionality, positioning.

A Note on the Authors' Positionalities

We feel it is consistent with the values of integral education and responsible in light of our subject for us to articulate our own positionalities as authors. Collectively we are a collaborative group of eight emerging from the inaugural semester of the Integral Teaching Fellowship Program at the California Institute of Integral Studies. With an emphasis on critical pedagogy, integral education, and liberatory teaching methods, the program aims to prepare graduate students to teach in the college classroom using innovative approaches to teaching and learning. Positionings within the group are complex. Six of us were fellows and two are the faculty members facilitating the program. Four of the fellows are doctoral students, one an MA student and one an MFA student. The faculty members both have MFA degrees. The authors are listed alphabetically not hierarchically reflecting our understanding that knowledge is co-created and socially constructed.

Earlier work together in the Integral Teaching Fellowship Program, and on the presentation at the 2014 CIIS Founders Symposium on Integral Consciousness that this article is based upon, had left a legacy of hierarchies, alliances, and tensions among us, which came to the surface early on in our collaboration, and which we have had to explicitly navigate during the process of writing this article. Writing collaboratively with even one other person can be a challenge, let alone fitting a close publication deadline into the busy schedules of seven other co-authors. We used personal and group check-ins, which had been a feature of the Fellowship, to stay in

relation and to negotiate the hurts, conflicts, and tensions which arose. In our work together, as in the classroom, our positionings were not only present, but critically influenced our work. In this spirit, we will start this article by sharing a little about ourselves.

Individually we come from a wide range of positionalities:

Sara Maria Acevedo is a South American woman, she identifies as an immigrant “who passes.” She is a disability studies scholar and a cultural anthropologist focusing on social change. Her interests in scholarship range from feminist theory, to critical geography, to postmodern philosophy.

Michael Aho is a Finnish American straight white male, who was raised by working class grandparents, who works as a manager at a graduate school.

Eri Cela is doctoral student and a somatic psychotherapist, who identifies as an Albanian immigrant in the US, a transdisciplinarian, and culturally hybrid.

Juei-Chen Chao is an Asian woman who grew up with Chinese Culture in Taiwan and migrated to the West in the US to receive higher education in her late 30s. She considers herself as a person of “in-between” because after years of immersing in the American culture, she is no longer fitting in the typical Chinese-Taiwanese culture nor becoming American. As a scholar in training, she intends to bridge differences between cultures and attempts to promote equality and diversity by raising awareness of institutionalized racism in her work.

Isabel Garcia-Gonzales is a first generation Filipina American, woman of color, mother, writer, educator, and administrative faculty member in an undergraduate program.

Alec MacLeod is an older university professor who identifies as a heterosexual white male born in the US of largely Anglo Saxon descent. He lives in Oakland with his multi-racial family. He is a faculty member in an undergraduate program.

Claudia Moutray is an Italian American woman who is a feminist with a conservative background that steered her down a liberal path that she continues to walk. She is a PhD student studying Women’s Spirituality, in her other life she is a swim team coach working with kids.

Christina Olague identifies as Chicana. She was raised until the age of 15 on a farm laborer camp and this experience influenced and helped to shape her interest in public policy and social justice issues. She served for 7 years on the Planning Commission of the City and County of San Francisco and 1 year on the Board of Supervisors. Raised Catholic, she has spent much of her life exploring different spiritual practices that include Northern European mysticism and Bon Buddhist practices. Currently she is a graduate student in counseling psychology.

Our collaboration has been a laboratory for learning about the challenges of not only appropriately valuing and incorporating this extensive resource of positionalities, but also of negotiating across a range of cultural differences and personal styles in the midst of complex personal and collective histories.

We will draw from our individual and collective experiences working on an interactive session for the Symposium at CIIS to ground our inquiry into the epistemological relevance of positionality in critical pedagogy and integral education. We will also present and reflect upon the content of the symposium, as well as the planning process itself—the challenging and fruitful work of co-creating knowledge. Finally, we acknowledge that the process of writing this article, as a collaborative group of authors, each with individual positionalities and shifting positions within the group, has also informed not only what we present here, but also what we do not present. In this article, as in the classroom, some positions are explicit, some are assumed, many are invisible and unknown, but all are impactful, even if their presence is not acknowledged.

Integral Education/Critical Pedagogy

The theoretical backbone of integral teaching and learning is rooted in the coming together of critical and integral approaches to education. These two distinct and often overlapping meta-approaches have developed in part as alternatives to conventional systems of education. The conventional educational models have been critiqued for practices that reduce and de-contextualize knowledge (Morin, 2001), preserve and reinforce hierarchical and dominant social orders (Freire, 1996; Giroux, 2007), and disenfranchise the knower from the production of knowledge (Freire, 1998; Shor, 1992; hooks, 1994). The industrialization of education (Giroux, 2007), organized around highly specialized and compartmentalized disciplines, produces knowledge that is disjointed and increasingly difficult to contextualize (Morin, 2001). The de-contextualization of knowledge is extended by removing the learner from the production of knowledge. Learning practices are reduced to memorization of information, acquisition of existing problem solving procedures, and to the reproduction of it all in the exact form it was served to the students (Montuori, 2006), in other words, students are reduced to the role of course takers (Lovitts, 2005). In this assembly-line approach to education (hooks, 1994), the students' lived experiences, identities, and their social milieus play little to no epistemological relevance in the production of knowledge.

In contrast, critical and integral approaches to education produce knowledge that contextualizes and connects (Morin, 2001). Knowledge is situated in the knower, socially constructed realities, and in the process involved in knowledge production. Integral education recognizes the multidimensionality of human beings and social systems (Chaudhuri, 1977) as well as the complexity in which the parts are woven together (Morin, 2001). Critical pedagogical practices challenge regressive and oppressive social orders, and encourage embodied learning, critical thinking, participation, and dialogue (Shor, 1992; hooks, 1994, 2010).

In integral education, both the learning community and its individual members are understood as complex unities. Therefore, an integral approach to education can be conceptualized as a process that invites and incorporates the lived histories of students and educators while at the same time mediating the multidimensionality of the academic setting and pedagogical discourse. An epistemological assumption of critical and integral approaches to education is that the learner's subjectivity and social positionings play an essential role in the practice of inquiry and knowledge production. The intersection of the identities and experiences produced outside the academic context with those produced in the pedagogical praxis add to the complexity of an integral learning community.

As previously stated, we authors first came together as six graduate fellows and two faculty members of a teaching fellowship program that focuses on integral education, critical pedagogy, and liberatory teaching methods. As part of the requirements of the program, we engaged in a body of literature chosen by the faculty members to develop a shared theoretical foundation for the teaching fellowship experience. Of particular relevance to our discussion here is the reading selection "How Does Your Positionality Bias Your Epistemology?" by David Takacs (2003). In it, Takacs asserted that we educators must ask the title question of ourselves and must support students to ask it of themselves. In other words, "How does who you are shape what you know about the world?" Takacs further explained, "By respecting the unique life experiences that each student brings into the classroom…we empower all students as knowledge makers. We allow each student to assert individualized knowledge that contributes to a collective understanding" (p. 28).

Takacs' assertion that positionality can play a central role in the co-creation of knowledge in the classroom has relevance to Freire's critical pedagogy; students who bring their life experiences and individualized knowledge are not "empty vessels" waiting to be filled by their professors. This allows for the democratic, participatory education that critical pedagogy aims to create. Further, Takacs' insistence that positionalities be brought into the educational process speaks to Chaudhuri's (1989) work on integral education, "which is based upon the concept of the total man and education which is based upon the total human situation, the global situation" (p. 78).

Interestingly, Takacs did not provide an explicit definition of positionality, but provided some examples, such as "ESL student," "young Mexican woman," "army wife facing financial hardship", "white students," among others. Later in this article, we will delve deeper into positionality definitions and theoretical frameworks, but it is important to start here, where we authors started, in our initial collective inquiry into the epistemological relevance of positionality in critical pedagogy and integral education. Perhaps because Takacs did not define positionality for us, our group engaged deeply in our own co-creation of knowledge to better understand and collectively define what we mean by this term. When we were invited to facilitate an interactive session in the Symposium, we knew we wanted to engage this concept of positionality and its relevance to us as integral educators interested in critical pedagogy, but we had yet to define it.

The space left by the missing definition opened up an opportunity for our group to undergo this process of bringing individualized knowledge and perspectives to create a more meaningful collective understanding. It is also important to note that the involvement in the interactive session was strictly voluntary and outside of the scope of the fellowship program. This shift from the structure of the fellowship program to an outside, volunteer collaboration shifted our internal group positions and relationships. No longer were the two faculty members the facilitators while the six fellows were the participants. While within the fellowship program the faculty members attempted to create a more horizontal learning environment (and thus model a critical approach to pedagogy) by rejecting an expert-centered model of education, now in this new formation, our roles were as eight collaborators and colleagues. This will be important in our later discussion of positionality and positioning. For now, we will only note that our group dynamic shifted, allowing for more fluidity among the participants and the roles we played in our group.

We then began the important and challenging work of collaboratively defining our terms and designing our session. Through periodic meetings and email threads that were often long, sometimes confusing or frustrating, but fruitful, we set about our collective inquiry, posing questions, adding our perspectives, affirming and challenging one another.

Theoretical Frameworks on Positionality

In the review of the literature for this article we came across two distinct but overlapping theoretical frameworks on the concept subject of position. The first, positionality theory grew from postmodern feminist theory (e.g., Harding, 1991, Alcoff, 1988, Collins, 1986). The second, positioning theory emerged from social psychology (e.g., Davies & Harré, 1990, Harré & Van Langenhove, 1991). Both theories attempt to critique the essentialist construction of subjectivity and the deterministic view of social participation. Specifically, contributors of positionality theory challenged the essentialist views of identity as fixed, on-going, and rooted in dominant individual and group characteristics (Kezar & Lester, 2010). They claimed that individuals occupy multiple identities, fluid and dialogical in nature, contextually situated, and continuously amended and reproduced (Alcoff, 1988). The positions from where we make meaning of—as well as engage with—the world are informed by our identities and lived experiences. Applied to our inquiry at hand, the traditionalist would view the student's (or the educator's) identities as independent of the learning environment and constant across contexts. In contrast, positionality theory would suggest that student's identities vary across contexts and inform as well as are informed by the individuals' positions in the learning environment. As such, "positionality theory emphasizes the position of or situatedness of identity" (Kezar & Lester, 2010, p. 166).

Positioning theory emerged in part as an alternative to role theory in an attempt to better account for the complexity of human participation in social settings. Davies and Harré (1990) critiqued the dramaturgical model of social psychology in which "people are construed as actors with lines already written and their roles determined by the particular play they find themselves in" (p. 52). Positioning does not reject social roles altogether, in fact, on one end our positions are informed by the duties and expectations particular to the roles and social discourses we inhabit. On the other end, positioning allows for the subjective histories of individuals—identities, personal attributes, experiences, as well as preconceived narratives and understandings of our social locations—to play a critical function in the production of interpersonal behavior (Harre´, R., Moghaddam, F., Cairnie, T., Rothbart, & Sabat, S., 2009). In other words, positioning theory suggests that we are not simply actors of predetermined scripts, but also agents and authors in our social participation.

Other Models of Positioning

When we think about our "position" in the world, and more specifically about our position in society, we reflect upon the different roles that occupy us in our lives. In other words, when we inquire into the different ways in which we participate in our various communities: in our family, in our neighborhood, in our work, in our school/classroom, in our informal gatherings and in our formal gatherings alike, we come to the realization that we are in fact multifaceted individuals; we adopt different stances as we navigate different communities of interaction.

Our position in the world, according to the above definition of positionality, is radically shaped by our interactions (or, intersubjectvity). Disciplines in the social sciences, more specifically Sociology and Anthropology, have a tendency to describe human beings as "inherently social" – and this is to a large extent accurate (and debatable in other contexts). We agree that the social and cultural spaces we navigate are shared; that the lives that we lead are at once individual and collective, and that the shaping of our social world/s happens in collaboration with others (whether such collaboration is willful or enforced). In short, social relations shape the way in which we understand ourselves as individuals and, from that understanding, how we perceive and interact with others.

Virtually, no human interaction occurs outside of a shared social context. Meaning-making is one of the most fundamental social processes impacting our communal lives; as an embodied social phenomenon, it affects our very bodies as well as the perceived "reality" of the different human groups marked oppressively by "undesirable" attributes (e.g., poor, Latino/a, woman, disabled, immigrant, and fanatic). French semiotician and philosopher Barthes (1978) identifies language as an institution of power. Speech, he argues, serves as a key instrument in social stratification processes in as much as "once uttered, even in the subject's deepest privacy, language enters the service of power" (as cited in Kearney & Rainwater, 1996, p. 366).

Other social theorists and philosophers such as Foucault (2005) concurred with Bathes: "in every society the production of discourse is at once controlled, selected, organized and redistributed according to a certain number of procedures…" (p. 216). Additionally, in *The Birth of Bipolotics: Lectures au Collège de France*, Foucault (2008) argued that individuals are historically subjected to different forms of social inclusion and exclusion and are meticulously boxed into different categories and subcategories of being via discourse. He termed this set of procedures 'biopolitics' (or the administrative management of life), and he insisted that conceptual arrangements perpetuate operations of inclusion and exclusion through the reproduction of hierarchies of privilege and marginalization. The latter, in turn, shapes people's experiences and positions in the world.

Conceptual stratification is often articulated around culturally assigned attributes such as gender, race, class, ability, sexuality, nationality, ethnicity, political affinity, and religious/spiritual practice. These attributes are animated and brought into play in our interpersonal relations – in our relationship with our family, with our professors/students, with our employers/employees, and with people in the service industry; in the more macro-structural arrangements occurring in social institutions – our relationship with the law, and with the larger economic and political systems; and in the more overarching social sphere.

Because one of our tasks as integral educators is to explore and uncover shared social processes affecting the position of knowledge producers (especially those marked oppressively by race, class, gender, ability etc.), we wish to inquire into these processes from the "inside."

We do so, to investigate into alternative pedagogical practices emerging out of more traditional contexts in education. Integral education is not necessarily modeled after dissident practices within traditional models of education, however we believe that an exploration of existing methodologies in traditional education can help to ground our understanding and recognize the generative value of alternative practices in the classroom. One of our goals is to facilitate co-creative learning spaces, beyond the traditional university format, in a way as to re-imagine and integrate traditionally marginalized epistemologies in research design, curriculum, and teaching methods.

To this end, we follow on Collins footsteps to include an expansive notion of the "outsider within" status. On the function of this literary trope, Collins (1986) wrote: "this 'outsider within' status has provided a special standpoint on self, family, and society for Afro-American women [and other oppressed groups]" (p. 14). Although Collins' claims are specific to the context of black feminist thought and its significance in "generating a distinctive standpoint on existing sociological paradigms" we briefly investigate into the implications of the "stranger" in traditional academic settings (p. 14). To introduce Collins' ideas into the larger context of liberatory education, we touch on the theme of reflexivity in feminist research. We incorporate a handful of Chiseri-Strater's ideas from her 1996 piece: *Turning in Upon Ourselves: Positionality, Subjectivity, and Reflexivity in Case Study and Ethnographic Research*. A thematic approach to Chiseri-Strater's various roles/positions in the academy helps us to situate the topic of positionality in the context of integral education. To further illustrate this point, we look at the author's integrative and interdisciplinary approach to research and education. Her role as a non-fiction writing and composition instructor enables her to establish significant connections between product (the finalized ethnography) and process (the ethnographer's stance-position-location as well as the influence of subjective-contextual factors such as personal life story and experiences during the data collection phase). Chiefly, there are elements in Chiseri-Strater's own situatedness (situation/awareness) as an instructor that emerge, out of experiential practice, as a teaching tool. In turn, her position as an instructor enables the author to speak critically to her own research methods.

The decision to include this piece as a part of our conceptual framework emerged out of a collective interest in exploring different approaches to positionality theory and praxis in cross-educational contexts. We are particularly interested in the ways in which Chiseri-Strater's most compelling arguments and experiences translate into our view of integral education – especially as they prioritize non-traditional approaches to pedagogy (methodological disclosure) and alternative methodologies in ethnographic research (critical ethnography). As she put it, "my gender and training as a writing teacher positioned me to resist the non-interactive pedagogies—like antagonistic debate and strict lecture format—of other disciplines" (Chiseri-Strater, 1996, p. 122). She also shared that "the ethnographic researcher has to enlist the subjects of study as partners, as posers of questions, as people who can see and change their own experiences through interaction with 'outside' but politically interested teacher-researchers" (p. 123). This last point is of particular relevance to the kind of educational experience that we understand to be fully interactive, participatory, and therefore transformational.

Chiseri-Strater's findings on gender differentials, expertise, and belonging speak extensively to the way socially assigned categories are not only embodied, but also performed in our day-to-day lives. Her remarks on the implications of biosocial elements, which are accepted as universal realities, but which are constructed, inform our own thought process and further solidify our critical stand as integral educators. We believe that there are real (embodied) implications of social stratification processes. These processes mark bodies as targets of exclusion, thereby preventing them from fully participating of their immediate social and cultural words. We recognize that educational settings contribute to the process of social stratification, as they often times serve to "filter" through practices of knowledge-production. Historically, academic settings have been traditionally articulated around the creation and legitimization of "true" knowledge (following on the scientific method). As a result, many non-Western (ethno-communities) and Western communities of knowledge have been "denied entry" into the world of rational meaning-making. Colonialism in academia has and continues to marginalize particular groups and communities from contributing to the "collective" epistemological archive. These issues then, are not merely educational, but have a huge imprint in the way we conceive of education as a political matter affecting the lives of living-breathing human beings.

Because we believe in and practice an approach to education based on critical pedagogy and liberatory methods – giving special consideration to the work of intellectuals such as hooks, Lorde, and Freire – we see Chiseri-Strater's non-traditional insights into education and literacy research through a shared lens. Some of her observations align with our own thought/writing process on this topic. One example of this synchronicity can be found in our understanding of education as a co-creative process, as opposed to the "banking system" model that Freire describes. In other words, we prioritize a framework in which different approaches to learning and different styles of teaching are integrated. Such methodologies are purposely situated in the context of integral education as "positioning" strategies; this concept will be further elaborated upon in a later section.

We have established above that a key point in Chiseri-Strater's piece is articulated around the impact of cultural attributes (such as race, class, or gender) on the overall ethnographic process. More specifically, she examines the role of gender in shaping theoretical, methodological, and rhetorical approaches to literacy. The emphasis is placed on research strategy and includes the author's own experiences as a woman in research practice. She does so by retrospectively situating herself with respect to her informants, her context of study, and her initial choices in research design. While carrying out research on the processes of literacy and composition in courses outside her discipline (more specifically in Art History), Chiseri-Strater remarked that, "while my role as a student allowed me to rapport with my informants, my status as a graduate student in composition marked me powerless from some of the professors who saw composition as a marginalized discipline" (p. 124). Similarly, her ethnographic notes on a Political Science class, whose professor she identifies as male, revealed that his spatial positioning in the classroom came across as rather territorial, and sometimes even unwelcoming. Lastly, the author's (disclosed) field notes on a composition and rhetoric class, a field that she identifies as her own, reveal instances of sexism on the part of one of the male students, as well as emerging 'gender battles' among women and male informants.

Chiseri-Strater contributes important content to ongoing disciplinary dialogues around the issue of so-called objective and detached viewpoints (or, the view from nowhere). In addition, she opens up a space for co-reflection (one that includes the readership) in which the language of positionality (which shapes data collection, theory construction, methodological understanding to narrative voice) is understood as both rhetorical and "inherently connected with how the researcher is situated in the field, not just on the page" (p. 120). Second, and by implication, she endorses an approach to ethnographic fieldwork in which specific choices in research design are a priori evaluated in tandem with the ethnographer's given attributes (race, nationality, and gender). As she noted, "providing methodological insights unavailable in the historical movements or legacies within the fields of composition and rhetoric where data is presented without the researcher's intellectual journey […] demonstrates how the researcher negotiates personal and cultural preconceptions that shape scholarship" (p. 115).

Somatic and Spatial Positioning

In this piece, we have focused primarily on two types of positionalities, biographical positionalities and discursive positionings. Biographical positionings include demographic representations, such as age, gender, class, race… and some social roles like parent, educator, student, musician. Discursive positionings address how we position self and other in discourse: what kind of positionings are available within a discourse/context, how are they ascribed or 'taken on', who has the power to ascribe a position, how are positionalities challenged, and new positionalities created through discourse.

In addition to these we would like to emphasize two other components of positioning, what we call: (1) somatic positioning; and (2) spatial positioning. Somatic positionings can be conceived as bodily organizations through which we embody and enact our personal and sociocultural identities. We participate in multiple communities and contexts that support or inhibit ranges of bodily practices (Grand, 2012). Building on Bakhtin's concept of chronotope, Grand suggested that every cultural tradition or community has a particular repertoire of embodied practices, or as he calls it, somatic genre, where individuals must draw from (as well as contribute to) in the course of their participation. Conversations in our own group of Integral Teaching Fellows are a good example of negotiating and practicing somatic positioning. We deliberated on how to shape and use our bodies—how much to speak and when to speak, what to wear, where to sit, and how to carry ourselves—to fit the image and role of an Integral Teaching Fellow.

The production of social space involves spatial representations (how a space is imagined) and spatial practices (practices through which the space is lived) (Lefebvre, 1991). Our spatial positionings depend on the available spatial representations and spatial practices. One of the authors recalls that during his education in Albania "good" students typically occupied the front rows, whereas the back rows were a destination for "weak" students. Although certainly not an official rule, the spatial positioning based on academic performance was a common and generally accepted practice. That type of spatial organization created a binary identity production in the classroom as well as shaped pedagogical practices. As it has been stated already, positionings are not deterministic. In exercising agency, be that through improvisation or deliberately impacting the course of action (Holland, D. C., Skinner, D., Lachicotte, W., & Cain, C., 1998) we can create new possibilities of being and acting in the world. In the context of an integral learning community, the ideas of somatic and spatial positionings enable us to identify somatic organizations and embodied practices that are liberatory and support learning and classroom participation.

How are social discourse and our subjective worlds related to positionality? Bakhtin's (1981) concept of chronotope (time-space) is useful here. Bakhtin theorized that different literary genres organize time and space in distinct formations that in return provide genres their particular characters and narratives. Similarly, our social interactions and lived histories are situated in different time-space configurations, each with a particular discourse and repertoire of representations. Leander (2004) proposed that certain types of positionings evoke particular chronotopes, and by doing so they call on the attributes, ideologies, practices, cultural narratives, and social identifications specific to each time-space configuration. For example, taking on the position of an educator in the classroom evokes privileges of power, however, the qualities and practices will differ if the educator is positioned in a traditional pedagogical context versus a liberatory pedagogical context, the first being more authoritarian and the second more horizontal. Another example (one which we elaborate later in the article), sharing personal stories of our names can evoke a series of time-space constructions, ranging from familial, to institutional, to ideological, to transnational. For our purpose, chronotopes can be theorized as containing personal and shared psychological, cultural, and social resources, and positioning as the practice by which these resources are utilized to make meaning, construct relationships, and shape action (Holland & Leander, 2004).

Positionality in a Learning Community

An integral approach to education invites the personal histories and imaginations of the students and educators in the process of knowledge making. The narrative worlds of the participants come in contact with classroom activities. Leander (2004) offered a useful distinction of time-space configuration to explain such contact zone of activity. Leander makes the distinction between an interactional chronotope (the immediate time-space of the interactants) and a represented chronotope (the imagined and the historical worlds of the participants). He went on to say, “when narrative scenes are marshaled in the interactive work of positioning, these narrative scenes carry with them forms of time-space that offer unique possibilities for identity and agency” (p. 189). Leander’s idea of positioning resonates with Alcoff’s (1988) concept of positionality. She wrote:

> [T]he position that women find themselves in can be actively utilized (rather than transcended) as a location for the construction of meaning, a place from where meaning is constructed, rather than simply the place where a meaning can be discovered (the meaning of femaleness). The concept of woman as positionality shows how women use their positional perspective as a place from which values are interpreted and constructed rather than as a locus of an already determined set of values. (p. 434)

When coupled with awareness, critical thinking, and reflective practices, the activity of positioning can be more self-directed, strategically applied, and transformative.

We ground this theoretical discussion on the practice of positioning in an example from our own work. In a classroom exercise facilitated by one of the teaching fellows, students were asked to explore the concept of ‘borders’ and ‘belonging’. This exercise was linked to another learning activity in which students organized in five small groups of three to four each, based on a shared cultural community in which all the group members felt they were participants. Students were encouraged to investigate the concept of culture particular of their groups over the course of the semester. In this exercise, deep into the semester, students were asked to physically position themselves as well as the representations of their cultural communities in the shared classroom space using colored ribbons to mark personal and group borders. Students were encouraged to evoke the characteristics of their group cultures, to call on reading assignments, and to be attuned to their personal, interpersonal, and intergroup experiences as they negotiated their locations and boundaries in the classroom space. What transpired was the authoring of a dynamic and contentious time-space formation. Students reported that their decision making process and the production of locations and borders were informed by their cultural narratives as well as by the interaction between individuals and groups. Some students reported that their newly authored positions shed new light on their explorative cultures and their participation in the learning community (e.g., a student linked her peripheral position in the exercise with the feeling of not being present in the classroom). In this exercise, the intersection of multiple layers of represented chronotopes (students' backgrounds of their group cultures) with the interactional chronotope (classroom participation) served as a medium through which students interpreted the concepts of 'borders' and 'belonging'. The practice of positioning was employed in the production of knowledge.

Challenges in Incorporating Positionality in Pedagogy

We identify two particular challenges in the integration of positionality in pedagogical practices. The first challenge is related to the increase of the learner's role in the process of knowledge production. Excessive emphasis on the function of the student's positionalities in the learning process can cultivate what Montuori (2006) has called a narcissistic approach to education. Narcissistic learning systematically privileges the learner's subjectivities, experiences and various self-positionings as sources of knowledge over academic standards or dialogical methods, an orientation that can lead to anti-intellectual stances and unchallenged self-positionings. The integration of student positionalities in the learning process needs to be accompanied by critical thinking practices (Brookfield, 1987) that encourage self-reflection, critical subjectivity, and examination of the student's situatedness in learning and scholarly communities (Takacs, 2002, 2003).

The second challenge of integrating positionality in pedagogical practices has to do with the increase in complexity of the learning community. By inviting positioning practices, a learning community becomes more pluralistic, multidimensional, and subject to new relationships and forms of functioning. As such, it must learn to embrace and cope with change. The success of a complex learning community is dependent on, among other things, the application of strategy, tolerance for the unknown, and the solidarity between its members (Morin, 2008; Schrader, 2004).

The Relevance of Theory to Practice

Neither positionality theory nor positioning theory originate in the field of education. While, as we have shown, both have been borrowed from other disciplines (adapted and, at times, conflated) for that purpose, no stable definition of "positionality" has emerged in the discourse. Like Takacs, many authors dodge the question of definition altogether while others reduced it to such traits as "race, gender, class, sexual orientation, ableness" (Taylor, Tisdell, & Hanley, 2000). Despite this ambiguity, the value of an anti-essentialist category of being that describes positionalities and positions is evident and the term "positionality" continues to capture it for us. For the purposes of our Symposium session and this paper the term positionality has three factors: *identity*, *role*, and *power*. Identities and social categories (such as race, age, etc.) are multiple and intersecting formed by lifetimes of experience. Roles are always context specific and are either formal (student, teacher, etc.) or informal (expert, etc.) The dynamics of power and privilege are at play in terms of both recognized social categories and roles specific to the situation. Thus considering positionality in the educational framework provides an opportunity both for creating less hierarchical relationships and a greater sense of what each participant can contribute.

Our Interactive Session: Positionality as Knowledge: Taking the Pedagogue off the Pedestal

The interactive session, "Positionality as Knowledge: Taking The Pedagogue Off The Pedestal," was structured around two exercises which all participants and facilitators were asked to join, two didactic presentations, and a substantial opportunity for participants to reflect on the exercises, the subject of positionality, and their learning. In advance, we identified three learning outcomes that we hoped to achieve:

1) Development of an understanding of "positionality."
2) Deepening of our understanding of our own positionalities.
3) Exploration of what it would mean to create a learning environment that values each voice in the classroom.

True to the values of critical pedagogy we arranged the seating in a circle. To reduce the concentration of power in the circle, facilitators (also the authors of this paper) scattered their seating rather than sitting together. The purpose here is to signal to participants that we anticipate relationships in this context to be relatively horizontal rather than hierarchical.

The opening, given by one of the facilitators, was a brief overview of the subject of critical pedagogy and an explanation of the purpose of the workshop. The concept of positionality was briefly introduced along with the strategies we would be employing in the session to understand it further. The facilitators introduced themselves individually as well as collectively, positioning themselves both in their roles for the session and in their roles and ranks in the institution.

This was followed by a general group exercise in which all were invited to participate. In advance, participants were informed that the purposes of the exercise were twofold: to introduce all participants, bringing each voice into the room and to begin the process of understanding one's own positionality. The exercise involved sharing not just one's name, but also stories associated with one's name. This was modeled by one of the facilitators. In the group we had origin stories ("I was named after…"), a story of the meaning of the name, what someone feels that a particular nickname says about themselves, and the histories of names changed (through marriage, personal transformation, or migration). Things were revealed or implied about the participants that are seldom discussed with near-strangers: family history, cultural situatedness, immigrant status, class, etc. This required some risk taking on the part of participants and created a small sense of trust, if not intimacy. Participants learned something about each person's positionality.

With this experience as a foundation two facilitators provided a more theoretical foundation of what positionality is and how an understanding of the concept and one's own positionality can be applied in the classroom. Our purpose was to deepen our participants' understanding of the concept of positionality and to situate it in relationship with learning.

Personal Reflections on the Practice of Positionality in Research

Below are the personal reflections of two of the co-authors, who shared their own understanding of positionality at the symposium workshop:

> It is not easy for me to describe my positionality in brief. As a person of color who grew up in the Chinese culture in Taiwan and migrated to the western culture of America, I have found my positionality is complex and in flux, constantly changing and moving, depending on which position I would like to take at the moment. I grew up in a traditional Chinese culture where obedience to authority and consideration of the goals of the group were considered the most valuable quality for being a student. In the classroom, there was no room for individual opinions; critical thinking and taking personal stands was not encouraged or allowed. However, as an Asian living and receiving higher education in the US, I was forced to learn to think and speak like a westerner, and sometimes I have to abandon or disregard the Taiwanese-Chinese side of me in order to fit in to this American education system to survive.
>
> After learning and exploring my own positionality, I realize that mine is multidimensional and has different layers. I can either think and/or speak from a point of view of being a minority from the East who is marginalized and experiences the institutionalized racism of the American culture, or I can also think and/or speak from my higher educational background of the West, being assertive to discuss issues with my intellectual and rational mind. By being aware of this lived experience of "in-between", it makes me more cross-culturally sensitive. I have found that I have no choice but to be open-minded to whatever I see, hear, learn and experience both positively and negatively, because I started to understand that there is no single truth for anything in the world. When I accept the multi-facets of the truth, my view has widened, and empathy has naturally matured and deepened. Most importantly, I have become appreciative of my unique experience of learning as a source of knowledge and a contribution to community.

***

> Let me begin with my position—my standpoint: I am a forty-year-old white woman who calls herself a feminist. I grew up in Oklahoma, the daughter of middle-class parents, and surrounded by conservative fundamentalists, which I call some of my dearest friends. I am a liberal-thinking Italian-American woman who is assertive when I believe an injustice against people and nonhuman animals has occurred. Growing up in Oklahoma offered me a chance to live outside my comfort zone, and because of that I had to learn how to get

along and rely on those who thought differently than I do. I moved from Oklahoma to San Francisco because I wanted to be in a bubble of like-minded thought, however I am vigilant about keeping one foot outside of this bubble. I believe that it is necessary for my own wholeness of being to have friends and family who differ from me politically, spiritually, and religiously. Of course there is much more to who I am, but this is the foundational lens in which I view the world, and this lens colors how I approach the work I do.

When I pick up a paper or begin to read a book the first question I ask is who the author is and what is their position. It is necessary to know this because it allows me to see how the research that I am reading is held. If I pick up an article about the causes of gun violence in teenagers and discover the author is a card carrying member of the NRA, I may find what I read to favor guns not being the cause of the surge in school shootings. In any article or book it would be hard to find an author who possess the power of neutrality; this is why positionality within a book or paper is so important. I need to understand the author's position so I can create my own theories and questions.

When someone reads my work I believe they need to know I use a feminist methodological standpoint, which incorporates my own experiences into the subject being explored. The use of a person's standpoint can offer the reader an alignment with the story being told. To explain this methodology further I look to the book, "Feminist Research in the Sociology of Religion" by Jones (2002), she wrote:

> One uses standpoint theory when one reflexively analyzes one's own inquiry or another's experience by taking into account the dimensions of gender, race, and power. The use of standpoint theory demonstrates how these social variables inform all aspects of the research project, including the selection of research topics and the cognitive framework within which a research problem is interpreted. Using a feminist standpoint, researchers inquire into the subjective experience of groups often overlooked in traditional analysis, and, in the process, uncover a multiplicity of subjective truths. (p. 78)

I interpret this to mean that all my social variables are influencing how I examine and write about a subject. I believe it is impossible to not be biased when researching something I feel compelled to write about. Using the feminist research methodology, I am allowed to state clearly who I am and where I stand within the topic, which gives the reader valuable knowledge. In the essay, "Writing Feminist Research" by sociologist Charmaz (2012), she stated, "Authors who reveal their starting points and standpoints—and concerns and commitments—permit readers to assess both their approach and the quality of their content" (p. 477). By the author revealing their position it creates space for collaboration between themselves and the reader. I stop seeing the author as an expert and more as someone sharing information that I then get to add on to with my own thoughts and questions. Positionality starts by describing who you are and that in turn affects how you see the world.

Using my standpoint—my position, I show the reader who I am and why my work is important, the reader is seeing the whole lens in how the material is presented, not just

> from an expert centered perspective. The reader can then create their own theories and use what I am giving them as a starting off point for their own possible research. Stating my standpoint humanizes me as the researcher and tells the reader that there are other angles in which to gain knowledge about the subject I am writing about—not just mine. Knowing the researchers background, I am privy to untold biases that may appear and I am then free to agree or disagree with their approach to the subject.

After two of the facilitators shared their personal understanding of positionality, we then moved into the next full participation exercise, our variation of the classic anti-oppression activity typically termed the Power Shuffle. In this exercise typically facilitators ask group members who fit certain descriptive categories or criteria to cross to the opposite side of the room, away from the full group, then stop, and turn to face the group they left behind. The two parts of the group are given a few seconds to observe one another silently and to notice their feelings. The facilitators then instruct those who have crossed the room to return to their original place with the full group. (Simms, Vasquez, & Sherover, 1992)

We adapted the structure to our needs in a variety of ways. Rather than form a line and step over and back, we elected to form a circle and as each category was described, those who identified with it stepped into the circle. Rather than step out of the group, participants stepped into the middle and made eye contact with each other. The instructions were: 'step into the middle if you identified with a phrase, notice who is with you (in the middle) and who is not, notice how it feels to be in the center of the circle, and then step back to their original place.' Having a circle rather than a line was intended to create a greater feeling of connection.

The original exercise had 41 categories, and we knew we did not have time for all them, plus we wanted to illustrate positionality in an educational setting rather than exclusively highlight power and privilege. So we started out by asking each of the seven co-facilitators to choose ten categories. Then the two co-facilitators of this exercise met to discuss which we wanted to include. We made sure to include at least two from everyone's list, and either combined or modified those that were very similar until we had 21 remaining, to allow plenty of time for discussion and debriefing.

Our own positions and that of our co-presenters no doubt had an impact on our decisions of what to include or discard. For example, we were both from working class families, so we changed the original category "you were raised poor," to "you were raised working class" and then added "you were raised with economic privilege" to have more of a balance. Another similar category we later added was "you have educational privilege" to which, not surprisingly, every single person stepped into the center of the room.

Sometimes we combined multiple categories into a more inclusive and broader category, for example "you identify as a person of color" rather than including the original eight specific racial or ethnic identifications. Then we made the category broader, changing multiple age based categories into a single "you feel like you don't have a voice because of your age." Also, we changed some of the language to be gender neutral, for example "you have been discriminated against because of your gender" rather than using language such as "you earned less than a man for doing equal work" or "you have ever been afraid of a man's anger." We left out those questions which we worried could be too emotionality triggering in such a short exercise, such as those regarding sexual violence or physical abuse.

We started out the exercise asking for confidentiality and emphasizing that participation was voluntary. We made sure to build in plenty of time for the discussion questions afterwards and for group sharing as part of the closing. This was intentional, as a central part of integral pedagogy is the notion that students are not blank slates and that key aspects of the learning come from the participants themselves, rather than exclusively the facilitators. Allowing extra time for discussion was also important because the circle exercise was conducted in silence.

Having engaged the two exercises, and heard the mini-lectures and sharing on our subject, we provided a series of reflective questions for the group to engage. “What was your experience of this exercise? Did anything surprise you? What would it mean to view the diversity of life experience in the room as educational assets? What voices are still missing or that you would like to include?” We started with these open-ended questions, and made sure that everyone had a chance to share if they chose to. The discussion was lively and suggested that the concepts were understood.

We closed with one of the facilitators sharing a quote from a 1996 interview of Freire (LiteracyDotOrg, 2009):

> If you asked me, Paul, what is in being in the world that calls your own attention to you? I would say to you that I am a curious being. I have been a curious being, but in a certain moment of the process of being curious, in order to understand the others, I discover that I have to create in myself, a certain virtue without which is it is difficult for me to understand others. The virtue of tolerance. It is through the exercise of tolerance that I discovered the rich possibility of doing things and learning different things with different people. Being tolerant is not a question of being naive. On the contrary, it is a duty to be tolerant, an ethical duty, a historical duty, a political duty, but it does not demand that I lose my personality.

Summary/Closing

For us the concept of positionality is important in understanding the role of experience in the learning process. Positionality acknowledges complex differentials of power and privilege while simultaneously identifying the value of multiple ways of knowing and being that arise from our multiple identities. The goal of revealing individual and relative positionality is to de-center dominant ways of thinking and expose multiple ways of thinking as diverse assets for self-knowing and collective-knowing.

In our workshop we both shared this concept and engaged in the process for all participants to share their complex positionalities. The process was interactive and participatory in structure. We did not follow a standard lecture model; there was not one “expert” on stage and participants were not a passive audience. Participants and facilitators both spoke deeply and personally. We learned from the stories everyone shared, informed as they were by their unique perspectives.

We are not suggesting that participants walked away from our presentation with a sophisticated understanding of positionality, much less its pedagogical value. Nevertheless, we feel confident that by using personal disclosure, participatory exercises, group discussion, and action methods of teaching, participants were able to experience some of the complexity and importance of positionality in the context of integral education.

As we close, we feel that it is important to collectively reflect about our process of coming together as a team to produce this article; this is our summation: Before even considering the task of writing up the Symposium session, we had said goodbye at the end of the Teaching Fellowship. It seemed we all ended on a high-note. It was a busy semester and each of us relied on the others to make it through. It felt like each of gave a *resounding sigh of relief*, yet when the opportunity to further develop our symposium work came up, each of us *jumped* at the chance and agreed to do it.

However, in collaborating again it felt like we were trying to *put the band back together* and recreate magic that was once there. Scheduling problems, interpersonal and intellectual tensions, and deadline pressures caused conflicts. Also, there was a shift in all our positions — no longer were we Fellows and Faculty, now we were co-authors, and this was a role we had yet to explore with one another. What carried us through the rough patches was respect and trust, excitement in creating something publishable, growing through the challenges in working through tensions and shifting positions, and a commitment to be present. And once again, there is a collective *sigh of satisfaction* as we reach completion.

Manifest Transpersonal Experiences:
Aṇimām and *Laghimā Siddhis*

Robert V. Burke[1]

Abstract: This article recalls with vivid awareness the Alex Gray like vision of infinitely small pulsating structures within my own body, and of bodily sensations of levitation I recalled when I read in Michael Murphy's *Future of the Body* the references to Haridas Chaudhuri's unpublished *Yogic Potentials or Siddhis in Hindu-Buddhist Parapsychology*. Along with Murphy's section of *Extraordinary Somatic Awareness Mediated by Internal Clairvoyance*, and within the framework of Ramamurti S. Mishra's *Textbook of Yoga Psychology* that provides context for Patanjali's Yoga Sutras, one sees as Chaudhuri explicates, how *aṇimām siddhi* of infinitely small somatic perception, and how *laghimā siddhi* of levitation are manifested. This artcile provides the notions, context and details of how such yogic potentials operate as transpersonal experiences of the body, mind and psyche.

Keywords*:* chittam, cryptesthesia, clairvoyance, extrasomatic, levitation, parapsychology, psi-gamma, psi-kappa, psychokinesis, sankhya yoga, siddhis, telekinesis, telergy, yoga sutras, yogic contemplation.

Introduction

Based on several extraordinary experiences, Murphy (1992) confirms in *Future of the Body* what I intuited: "that body awareness has extrasomatic as well as purely physical components" (p. 91). I have had several other experiences, but elaborate on the following two, *aṇimām siddhi* and *laghimā siddhi*, because they have had a most profound and transformative impact on my psyche. Haridas Chaudhuri in his unpublished paper: *Yogic Potentials or Siddhis in Hindu-Buddhist Parapsychology* defines siddhis as:

> Supernatural powers inherent in the human psyche... They are extraordinary aspects of the human potential. Perceived as revelations of ultimate truth or reality, they are termed Vibhuties (that are manifestation of Divine powers). Perceived as fully actualized abilities or dynamic capacities, they are known in their totality as Aiśvarya, i.e. spiritual wealth. (Chaudhuri, n.d., p.1)

---

[1] **Robert Burke** is a doctoral student in the East-West Psychology program at CIIS with special interest in the Transcendent Function of Jung's Individuation process and yoga psychology, as well as Sanskrit studies in order to source Yoga texts in the original, and to better understand the relationship between Eastern and Western approaches to Psychology. Robert's spiritual background includes Christian Monastic disciplines with the Trinitarian Brothers in Baltimore, Maryland, and Salamanca, Spain combined with yogic practices at the Yoga Society of San Francisco, founded by Dr. Ramamurti S. Mishra. These studies and practices have profoundly informed his understanding of Siddhis and their role in healing and spiritual awakening.

SOME RIGHTS RESERVED

I have had direct experience of two of these *siddhis* that I discuss and examine below. Briefly, in the presence of my Guru, Sri Brahmananda Sarasvati, I experienced myself as a field of energy wherein I perceived every aspect of my body at the atomic level. Precisely, I experienced the pre-quantum vibrating strings level of my existence. I experienced the second while attending Mass as a Trinitarian Friar where I was overcome by powerful sensations of levitation. My monastic training prepared me for a mature encounter with these paranormal experiences so that I neither got lost in them, nor did I lose sight of the Self that was the focus of my seeking. In my monastic studies I was cautioned not to place emphasis on siddhis. Like my Spiritual Master, Fr. Damon, Huston Smith gives similar advice that I discuss later. I begin with an examination of the first experience.

Eastern Perspective: *Aṇimām Siddhi*

After reading Murphy’s explication of *anudrishti siddhi, antara drishti siddhi,* and *aṇimām siddhi,* I referred to his reference to sutra 26 in chapter III, the *Vibhūti Pādah* in Ramamurti S. Mishra’s (1963) *Textbook of Yoga Psychology* where he makes commentary on Patanjali's *Yoga Sutras*. Mishra’s commentaries that follow also refer to the following siddhis, or paranormal experiences that Murphy (1992, P. 91) defines:

1. *Anudrishti siddhi*—a term derived from *anu*, atom, and *drishti*, insight—refers to a yogic apprehension of small, hidden, or remote things, including somatic structures.
2. *Antara drishti siddhi* is said to produce an X-ray look into our bodily parts.
3. *Animam siddhi*, one of the eight famous powers referred to in several yoga sutras, also involves such capacity.

These terms apply to an experience I had in 1992 at a *satsaṅg* and meditation led by Dr. Mishra, then known by his *sannyās,* or monastic name, Sri Brahmananda Sarasvati, of what Murphy (1992, p. 91) categorizes as an *Extraordinary Somatic Awareness Mediated by Internal Clairvoyance: aṇimām siddhi.*

Haridas Chaudhuri's (n.d.) catalog of siddhis brought the three *siddhis* mentioned above to Murphy's attention. According to Murphy’s (1992) footnote he states "Chaudhuri believed that the *aṇimām siddhi* has various aspects, among them internal clairvoyance by which we can perceive our body's cells, molecules, and atomic patterns” (p. 91). Murphy (1992) further elaborates:

> All our capacities, whether normal or metanormal, somatic or extrasomatic, are subject to the limitations and distortions produced by our inherited and socially conditioned nature. And it follows, then, that some internally clairvoyant perceptions would be more accurate than others, less filtered by half-conscious or unconscious psychological processes, and could be improved by transformative discipline, as Sutra 26 of Book Three in Patanjali’s *Yoga Sutras* suggests. Some, or perhaps all, of us might perceive our own body parts through occasional psi, but through a glass darkly, while with practice we might see them more clearly. (p. 92)

In the *Frequently Used Terms* section, Murphy (1992) defines *psi* as:

> A term proposed by B.P. Wiesner and R.H. Thouless, which can be used as either a noun or adjective, to signify paranormal processes and causation. *Psi-gamma* stands for paranormal cognition, *psi-kappa* for paranormal action. *Expressive psi*, a term used by David Griffin is synonymous with psi-kappa, *receptive psi* with psi-gamma. The term *psi* is meant to suggest that various paranormal phenomena are aspects of a single process, which in its active or expressive (psi-kappa) mode is called psychokinesis, telekinesis, or telergy, and in its receptive or cognitive (psi-gamma) mode is called telepathy, clairvoyance, or extrasensory perception (ESP). (pg. 588-589)

At a *satsaṅg* with Dr. Mishra, I had an immediate and total, sensory and mental awareness of the *kāraṇa śarīra* or causal body, and of the *sūkṣma śarīra* or subtle body. Muni (1994) delineates the three *śarīra* bodies into five major *kośa* sheaths that cover the psyche or *ātman*. According to Grimes (1996) one definition of *Ātman* is "The Reality which is the substrate of the individual and identical with the Absolute (Self), according to Advaita Vedanta" (p. 68). Of these five I became intensely aware of two: the "*prāṇamaya kośa,* sheath of vital airs" (Muni, 1994, p. 196) and the *ānandamaya kośa*, or "sheath of bliss; first sheath or covering of the Ātman (individual soul) in Vedantic metaphysics; causal body" (Muni, 1994, p. 188). I was totally aware, saw, felt and perceived every atom of my body. This, I now relate to as a personal experience of *aṇimām siddhi.*

Siddhis are powerful and there is danger we may misperceive or misunderstand the experience, this is why Murphy refers to sutra 26 of the *Vibhūti Pāda* as a means of improving the unconscious psychological process of *aṇimām siddhi.* Because of its importance I am including Mishra's (1963) full commentary:

> *Pravrittyāloka-nyasāt sukshma-vyavahita-viprakrishta-jnānam*
>
> By *samyama (the practices and three higher states of yogic contemplation: dharana, dhyana, samadhi)* on the shining and radiating, effulgent light (I:30) one manifests intuitive knowledge of the subtle, the veiled, and the remote. The inner light, the effulgent light has been explained (I:36). It is the light of *sattva* (harmonious) substance, the principle of consciousness, which is clear, shining, radiating, and all-penetrating. When the light is perceived by a yogin, he sees things, which are very subtle and minute, such as elements and atoms. He sees things, which are veiled and concealed. He sees things, which are very remote, things, which are happening in a distant place. By performing *samyama* on this light, inner consciousness is revealed. It is beyond time and space and is all-inclusive. Hence a yogin obtains cryptesthesia. (p. 257)

George (1995) defines cryptesthesia as:

> … literally, (a) 'hidden sensation.' Cryptaesthesia refers to information gathered by the senses that enters conscious awareness by some other form.
>
> The waking awareness generates a narrative based on the sensory input it receives. Input deemed irrelevant is frequently ignored or stored for later within the mind. Sometimes, however, the mind recognizes the need for that information, typically for the survival of

> the individual. In order to bring that information to the forefront of consciousness, the mind will transmit that material through sensory hallucinations (e.g. tactile, visual, aural) in an attempt to redirect and refocus the efforts of the individual. (pg. 57-58)

My experience of the *aṇimām siddhi* was not due to any yogic effort on my part. I was simply meditating, with approximately 80 students, in the presence of Sri Brahmananda Sarasvati. For me the experience was gratuitous, perhaps due to my attention on the Guru, but I do not recall any effort whatsoever. I was just sitting quietly. During the experience of *aṇimām siddhi,* when I checked in with myself, to affirm I was still in-the-body, I opened my eyes and noticed auras around other meditators, who I knew beyond a doubt, were having the same experience I was having. Actually the feeling of pulsations and vibrations around them were resonating with my own. I was feeling this gentle awareness of resonance and was absorbed in intense pulsations and vibrations, to the point of visualizing every atomic detail of my being; it was much more pronounced than awareness of the auras.

This was one of the most powerful transformative experiences in my life. It left me understanding without a doubt, that accounts of the essence and radiance of the Self emanating from other spiritual masters such as the Buddha and the Christ are true and verifiable in the presence of contemporary masters. This experience marks the culmination of the initial stage of my seeking. It affirms the reality of what I was seeking, and that the sought for was in me and I was in it too; however, I also understood that I still had and have more work ahead of me. Now, I see with greater clarity: the work that is happening by and thru me. I can feel it and confirm it by its gentle overwhelming sense of peace, tranquility, silence and love. At times though, I feel, there is nothing left to do. However, this feeling does not impede my participation in life.

Mindstuff is used synonymously as *cittam* by Mishra (1963), as a partial model of psyche based on the *Saṅkhyā darśan:*

> The total individual personality consists of three major systems. These are called *manah*, mind consciousness; *ahamkara*, ego consciousness; and *buddhi,* superconsciousness. The three systems form a unified and harmonious organization technically termed in Yoga, *chittam*. *Chittam* means the psychic mechanism which manifests *Chiti*, Consciousness. *Chittam* is the seat of consciousness. Consciousness is manifested in accordance with *chittam*. The whole world is *chittam* and the world is perceived according to *chittam*. From childhood to old age, *chittam* changes, so our experiences regarding the world also changes. Man is as his *chittam* is. This is the secret of all secrets. (p. 114)

Muni (1994) refers to what Mishra terms chittam as *antaḥ karaṇa*, the “Internal Instrument of cognition composed of Chitta consciousness, Buddhi intellect, Ahankara ego, and Manas mind; *the core of an individual’s personality, the psyche”* (p. 188, *emphasis mine*).

In the Vibhūti Pāda, Chapter III, Sutra 26 above, Mishra (1963) refers to sutra 30, concerning purification and removal of obstacles occuring in the unconscious psychological processes of *aṇimām siddhi:*

> *I:30 Vyadhi-styana-samshaya-pramada-alasya-avirati-bhranti-darshana - alabdha-bumikatva-anavasthitatvani chitta viksepas-te-antarayah.*
>
> These are nine obstacles, distraction of mindstuff. These appear with fluctuations of mindstuff. A breach in concentration would result in retrogression even from that stage. An effort should be made therefore in such a way that when a yogin has reached samadhi, highest concentration, mindstuff should be stabilized there.
>
> Concentration is a process of purification. It cleanses body and mind. During this cleansing process physical diseases, psychosomatic diseases, and mental diseases may appear if they are hidden in the unconscious or subconscious state of chittam. Concentration does not create mental or physical disease but if disease is latent and or dormant, it will be discarded by supra-electronic, tanmatric, concentration. One should not worry if one receives signs of disease because it is passing out of body and mind. If in the process of cleaning house one should discover a snake, one should not worry but should dispose of the snake and make the house clean and peaceful. Otherwise, if it were to remain undiscovered, sometime later it might attack one. If any disease symptoms show, one should not worry but should overcome disease and be rid of it forever.
>
> Not all obstacles come simultaneously. Any of them may come according to one's mental and physical constitution. They will never come if they are not dormant in one. Practice of meditation does not produce any disease. On the contrary, it destroys diseases. (pg. 146 – 147)

After his review of obstacles above, Mishra (1963) states in sutra I. 36 that “ the mind becomes calm, serene, and free from sorrow by meditating on the effulgent light at the third eye center, and it experiences the explosion of the light of consciousness” (p. 396). Mishra (1963) further elaborates in his detailed commentary on the all penetrating effulgent light that is the radiating source of the *aṇimām siddhi:*

> *I:36 Vishoka va jyotishmatee*
>
> By meditation on the transcendental and effulgent light of Purusha, Brahman, which is beyond all sorrow, self-confidence is positively produced, and mind becomes firmly grounded in Reality.
>
> By meditation on the effulgent light of the Supreme, chittam goes into higher changes. This personality change brings stability of mind and absolute confidence in Self.
>
> When a yogin fixes his attention on the ajna chakram, center of the head, thalamic region, or on sahasraram, seventh chakra, comprising the entire cortex, an effulgent light originates. Gradually it becomes resplendent and radiating, filling every part of the universe like akasha, ether. Skillfully holding chittam on this effulgent light, one has extraordinary change in mindstuff. It is transformed into that effulgent light which shines like the sun. The sattva quality of mind stuff is purified. It comes to a state of balance in

> Cosmic Consciousness with feeling of Cosmic Personality and becomes like a motionless ocean.
> Pondering the immanent, transcendent, and subtle Self one comes into direct realization of this light with the same surety one feels about oneself when saying, "I am." This transcendent and effulgent state of chittam is of two kinds:
>
> Vishoka Visayavatee, enlightening all the products of objective nature, prakriti.
>
> Vishoka Jyotismatee asmita matra, feeling of cosmic personality and enlightening Purusa by means of which the mindstuff of a yogin gains a state of stability and self-confidence.
>
> This effulgent light cannot be perceived by beginners. Hence they are advised to imagine this light either in the heart or the center of the head.
>
> Imagination can be a creative or destructive force. Imagination which is creative force is helpful in any branch of knowledge. So beginners should imagine that effulgent light in the heart or head until they perceive it naturally. (pg. 152–153)

Western Perspective: Levitation

Levitation is also known to yogis as *laghimā siddhi* that Grimes (1996) describes as “one of the eight powers which enables one to rise up in the air (on the rays of the sun)” (p. 173). The following is a personal account of such an experience:

During the novitiate we learned techniques of meditation, and how to meditate with an open and healthy attitude—Meditation without pretense or expectations. Once, as we gathered around the altar during mass, I began to levitate; no one noticed. I begged God, ‘Please, not here; you’ll embarrass me in front of all my friends.’ Reflecting on the experience, I actually did not *see* my feet lift up off the ground, but ascribed to the experience a sense of *kundalini* rising up the spine. Also, novices were admonished not to pay too much attention to sensory manifestations of meditation including visions and other extraordinary phenomenon (siddhis). We acknowledged them, but did not dwell on them. The manifestations are not the goal, we had been told that they can detract us from our goal of unity with the divine.

Houston Smith (2003) confirms this in a dialog with Mishlove:

> Mishlove: *So would you say there are some religious traditions that encourage the development and the cultivation of the psychic side of human beings more than others?*
>
> Smith: It’s interesting. I’ll put it the other way, slightly differently. That is to say that most of them believe that these powers are there and that they do increase as spiritual advancement occurs. However, they also warn against it, and say if you make this the goal, why, you’re settling for too little. And also there are some dangers; for one thing, this is treacherous water where one is not totally benign, but also there’s a strong temptation, as these siddhis, as the Indians call them—

> Mishlove: *Powers*.
> Smith: Powers, yes. As powers become available to you, people's heads get turned, and they become egotistic in their abilities. And so in derive, that way it can be counterproductive to the spiritual quest. So the greatest teachers are quite unanimous in saying they come but pay no attention to them.
>
> Mishlove: *But aren't there traditions— the shamanistic tradition, the Tantric tradition— which really emphasize these powers?*
>
> Smith: That is certainly so. Now, I guess I tipped my hand a little bit in excluding them from the most profound spiritual masters.
>
> Mishlove: *Perhaps you do have some preferences.*
>
> Smith: Shamanism is immensely fascinating, and extremely important in the history of religion. But sanctity one does not associate with shamans. They have immense power, and it can be misused as well as used. I think on balance it's been used. So I value them, but they're neither— what shall I say?—saints nor philosophers.
>
> Mishlove: *Well, perhaps we might liken the psychic abilities in this sense to musical ability, or to any other natural talent that could be used in different ways. And some religions cultivate music, I suppose, more than others.*
>
> Smith: That's right, that's right. Most shamans are very much linked with the people, in helping them with practical problems of life. But the aspect of religion that has to do with virtues and compassion and loving-kindness, now, this kind of thing is when I speak of profundity, getting into those waters. The shamans, that's not their forte. They have a different role. (pp. 219 – 220)

I am grateful for the specific readings assigned in Murphy's work because it has capped off my understanding of direct experiences of the Self that included phenomenological responses. While I find such experiences comforting and assuring, I do not seek them. I maintain a steady practice of performing the Vedic Fire weekly at Brahmananda Ashram in San Francisco, and bring the teachings of Nisargadatta Maharaj, Ramana Maharshi and other Advaitins and nondualist masters to those who attend. It is the power and grace of this millennia old ritual of Lord Agni's that attracts seekers, and Guruji said that when one reads from a Master's work, this Master's presence is "required." To me it is like the encounter of the kerygma, the Self in the logos. This encounter is the terminating juncture of relative consciousness and cosmic consciousness. It is encountered in deep silence wherein one experiences wholeness and peace. This is my experience. My practice of *Ātma Vicāra,* feeling and being the 'I am' in every moment is the active meditation I carry throughout my waking state. Any deviation and I am instantly reminded to return and abide in the Self.

The Restoration of Wholeness

Karabi Sen[1]

Abstract: Wholeness is an innate state, a quality which is lost with our exposure to the world. Our life is spent in efforts to restore the state of wholeness in us. The world takes from us our tranquility and balance. Yet it is only from this giving of us that we can recover our lost self. That which takes also gives.

Integration is a process which takes place in time and space. It is a developmental experience that admits of degrees, failures and regenerations. The integral self is not a finished perfect product. The self is born in nature and to nature. As such, it can mature, shine and bring itself to fruition only through trials and tribulations. Without the loss of wholeness we would never even have a vision of what constitutes wholeness; nor would we aspire after its retrieval. Creation is an evolutionary process which travels a path with many perils and also rewards. The journey to integration is difficult when we separate ourselves from our fellow humans and other forms of life or see ourselves as different from the soil and air and water that make us.

Once we see ourselves in all that surrounds us and recognize them in ourselves uniting is not hard any longer. When we unite with the world we achieve a united, harmonious, whole self within as well.

Key Words: Integral Philosophy**,** Integration**,** Wholeness

Introduction

Integralism, as I see it, is a restoration of wholeness. It is a process, never a finished product. At birth, our wholeness is shattered. Yet the inner being retains its vision of wholeness, a sense of completion and peace that comes with it. Then begins the arduous journey that we call life, which is an unceasing attempt to restore to itself the wholeness that is lost.

To be born is to be exposed; exposed to the elements, exposed to rejection, to abandonment, to needs that must be attended to. Thus it is that the baby howls when it exits the mother's womb. The world invades it. The parents rush to give it what it is crying for, to restore to it the divine peace of satisfaction. They rock it to sleep, give it the nectar of milk that will quieten it, are overjoyed to see that innocent smile on its sweet face for the first time. They believe they have given the baby back its wholeness.

Two things have happened when this has taken place. True, the baby has been made to feel at peace with itself. Its face is blissful. But in the process of restoring the baby's wholeness, the

parents have had to undergo the loss of their wholeness. Sleepless nights, unending feeding and changing of diapers, hardly any time to cook or grab a meal or take a shower, the piling up of dishes in the sink and filth on the floor, the fear of getting late at work, tension between husband and wife have taken a toll on father and mother. They are distraught. They have taken a chunk out of themselves and given it to the baby in order to arrive there where the baby has been restored to wholeness.

The disintegrated parents know that the baby's contentment is only temporary. They know that this search for wholeness will be a life-long process. Each time their child experiences loss of wholeness their own being will be struck and mutilated. Yet they know that wholeness can still be sought and restored back. They also know that they themselves will never be whole until their child is whole. So they develop strategies to repair the self, of those they love and their own selves. Those who do not have a strategy are wiped out by the strict Darwinian principle of struggle for existence and the survival of the fittest.

Integralism is such a strategy. It tries to ensure the preservation of the species. The system we are born with and into, our physical, mental and social apparatus and the environment in which they function, work as wholes do. A whole is made up of parts that must work in codependence to keep the whole in a viable and optimal condition. Any severing of the whole into disconnected parts will at once make it less survivable. In a competitive nature, the disabled system will succumb to further disintegration and dysfunction unless healing has restored it to the state of wholeness. A dismembered leg does not serve the purpose of running, walking or helping us to stand any more. If we replace it with an artificial leg, some wholeness is restored to the body, but if there is a need to run, the one with the artificial leg is more likely to meet an unkindly fate. Unless of course, there is help from a soul that recognizes the hapless one as a kin, perceives the basic bond between lives, and gives the disabled member assistance.

This sense of oneself as a unified whole made up of several members who belong together, the urgency to preserve it as such, the felt loyalty and the obligation to maintain the unit, observable even amongst roaches and ants, is programmed into our system. The gestures it generates are social behaviors which are geared towards preservation. Additionally, the eco-systems which constitute our environment in nature also function as wholes. Loss of balance in the environmental order makes our survival a questionable issue. Floods and cyclones are phenomena we must learn to work around until nature around us has regained a new transformed wholeness. As nature transforms, the beings it sustains undergo transformation. An awareness of the essential connectivity of all things that are, however rudimentary, is conducive to survival. It gives birth to traits like endurance, patience, hope, helpfulness. All of these qualities tend to promote continuation, regeneration and emergence of newer mutually supportive integral wholes. To abandon the sense of wholeness is to perish. Turmoil and disruption are meaningful only if they are seen as tools to bring in greater harmony. In the end, the team spirit assures a healthy and prosperous existence. It is common knowledge that self-expansion starts to occur from very early stages in our life.

We identify ourselves with our body, our room environment, our family, our schools, our towns, nations, the world and even the rest of the animate and inanimate world. We build bonds with the animals and have them as pets. We form associations with our homes, cars, furniture, books, kitchenware, clothes etc. They can grow to be like companions to us. We leave, but they stay on. We see a relative permanence in them. Slowly this process of self-expansion can envelope the whole world. We can be trained to see the rest of humankind as our brothers and sisters, be hurt by their suffering, outraged by their dehumanization, to take pride in their accomplishments. When many or most of us have achieved this stage, it is reasonable to hope that world peace is not far away. The aspiration to unite and be whole once again can be nurtured to attain this stage.

The aspiration to unify presupposes the preexistence of wholeness and peace. Strife and unrest signal a loss to us. Hence it is that we see the creator, who precedes creation, as whole, peaceful. The process of creation disrupts the peace but at the same time unleashes the pursuit of recovery of wholeness and peace. Many religions play with the idea of the original One becoming two and then engaging in the game of multiplication as being of the essence of Nature.

This has been applied not just towards earthly forms, but towards divinity as well, as in the Hindu concept of *ardhanaariswar* according to which the one spirit divided itself into male and female deities and together they form a whole. They always coexist. The whole continues to be a value even though the bifurcation is considered a necessary step for multiplication. In spite of variety adding spice to creation, the memory of the original unity remains a constant. Indeed we are born with the capacity to perceive objects as wholes. The skill gets better and better as we grow. When we see a face, we do not see the eyes, nose, the ears, the head separately, but the whole face. The gestalt is embedded in our perceptive process. When our power to hold on to the whole is lost we lapse into a pathological condition and await healing.

On a larger scale, wholeness is achieved when we are able to see ourselves in others and the others in us. We are one with the waters, the hills, the meadows, the birds and all other creatures when we see them in ourselves, when we realize our environment nourishes us and is as precious as family. We are also able to see ourselves in them when we see them subject to the same laws of nature as we are: coming into being, growing and eroding, transforming into many shapes and existents. When we reflect on that, we are protective of nature. When we are able to see ourselves in all that is, there is no escape from feeling friendship and compassion for all. This inspires us to give of us to them in the same way that parents deplete themselves to fill the child’s cup. There is a cost involved. Sacrifices have to be made. But in the end, restoring the whole in others always makes us whole again.

It is from this perspective that it is possible to say that no life has ever been given in vain and no injustice has ever been borne fruitlessly. It is in this sense that we can believe that Christ died on the cross an unfair death so that we could be in heaven. It is in this sense that Mahadeva is Nilkantha or blue in throat as he drank all poison so humankind could be spared its pangs. It is in this sense that the Lord Buddha was reborn numerous times so he could save suffering lives.

Wholeness cannot be bottled up but must be shared and the process of sharing involves giving, losing, creating and regaining of further wholeness, further spreading of well-being. Does this rise and fall of wellness take away from the value of the integral state of mind? The lack of finality is a negativity only if we see the unchangeable as the supreme value. The eternal, the permanent has always had an attraction for us. But the permanent in itself really has no value. What would come of us if war, hatred, misperceptions were to become permanent?

Without change there would be no reform, no progress. Unity, wholeness, an integral self are unstable quantities, rendered so by the inherent weight of their qualities in interaction with each other. The mantra of integralism has a dynamic quality within it. It is never petrified. Even after the flesh and bone that housed the integral spirit find eternal Nirvana in the death of its earthly vessel, their words continue to generate new actions, create new turmoil and churn the elements of creation in the path of producing more integral selves.

Pain is real. Disorder is real. To deny that is to dishonor those who have experienced it. But the bleakness of failure can be transformed into a positive when we are able to see through the eyes of the pained and speak through the mouths of the tortured and promise betterment of conditions. Suffering can only be a means to an end, never an end in itself. To the extent that we function as but parts of a whole we will suffer and create more suffering. It is possible, however, to rise above the partitioned self. It requires work and often assistance and support from stronger selves. The Bhagavad Geeta's yogic self which remains imperturbable in weal and woe alike is of no value unless it can be put to use to raise more of its kind. If the yogic self is locked up in isolation to maintain its serenity, then its value is limited to itself. Either it must come out of its shell to actively distribute itself amongst others in need of it or it must allow others to come to it to draw from its radiating peace. Either way, the yogic self will have to lose some to give some and add to the value of life.

Philosophers Aurobindo Ghosh and Haridas Chaudhuri had made this issue to be a central part of their integral philosophies. Both philosophers had stressed that being contained within it becoming as an inherent mode. What is, tends to become all that it could be. The drive to self-realization pushes being forward and makes it seek to manifest all the possibilities its being harbors within itself. The coming into being of all existents appears like a manifestation of a great spirit moving forward to birth its infinite possibilities in infinite shapes and forms. At no stage can we say that the emergence of new possibilities has died, that fountainhead of newer vistas has exhausted itself. Thus there is always hope for the future to open up fresh paths, newer landscapes. We may usher into ourselves the wholeness that we sought to embrace but we do not get to make it a permanent resting place. We draw upon it, make it a part of our being and then move on to put our strength to work where it is needed. Transcending conflict and attaining wholeness is something we carry with us for future applications. As Chaudhuri aptly pointed out, transcendence itself must be transcended and the process of self-expansion is boundless.

The more we expand ourselves, the greater is the happiness as the hatred and hostility diminish in the same proportion as the increase in the feeling of affinity and compassion. With each step of self-expansion our being is transformed as it has merged with a new being. Only the principle of inclusion can stop collision in a world that is en route to endless multiplication. The expanding whole, if it is based on perceived kinship, sooner or later generates mutual friendship and allows existents to coexist within the new system. The expanding whole provides a more spacious platform to the beings concerned to consider all the players involved in the field and allow for exchange of their perceptions of ways to be in order to create an environment that is safer, more harmonious. Aurobindo Ghosh's Purna (Integral) Yoga had this rare vision as its soul: that after I am a whole within, united in my body, mind and spirit, I remain in it and absorb it in myself and then descend again into the moving stream of Nature with my heightened strength to contribute as needed. United within and united without, integral within and integrated with the fellow existents is the core of Aurobindo and Chaudhuri's theory and practice of integral philosophy.

In this context it is important to remember three dimensions of all becoming:

Firstly, all change happens in the medium of time. The maturation of a seed to spring forth newness out of itself can only occur in time. Time is programmed into the being of all animate and inanimate objects, so much so that a seed can germinate even in the absence of several other environmental conditions necessary for a normal planting, as in beans and bulbs sending off shoots in early spring even as they sit on our kitchen shelves, drawers and even refrigerators, just because it was that particular time of the year. In inanimate nature, passage of time is recorded in events that take place cyclically, events that must occur simply because a certain period of time has gone by leading to certain formations or positions of earthly and other celestial bodies. Space and Time are partners entangled in the game of all becoming.

Secondly, since all change happens in time, degrees and steps are important marks in all becoming. Changes happen slowly, sometimes imperceptibly. This is of the essence of evolution. Even the cases we designate as emergents and mutants, their appearance may appear to be sudden leaps into creation, as unpredictable, as chance, but in reality they have causes of their own that lead to them. Their suddenness and unpredictability is a name for our own ignorance tied to our contemporary times and the specific spaces we inhabit. With the crossing of our specific time-space boundaries, we gain access to newer positions which grant us access to newer visions which in turn make possible newer understandings. If an expanding whole seems to be falling apart and the systems contained within it appear to be irreconcilable, may be in time they will slowly, by degrees, evolve a system which will allow for their integration, creating a habitat where several systems can function together. The possibilities are endless and so is the scope for hope. An individual's job is to keep hope alive and actively participate in the process of making the world a better place to be.

Thirdly, what are we to make of the merciless law of nature that life can survive only on life? Even if we turn to vegetarianism, we are plucking leaves and fruits off of living plants and depriving the young ones of cows and goats of their rights to mother's milk. Even the dry leaves on the ground serve some purpose in nature other than those of the human beings. How are we to defend the taking of antibiotics and the use of bleach to kill in our war on the deadly viruses? Are there some units that we cannot include in our self-expansion process? Here again, I think we ought to apply the principles of time and degrees. In each such crisis, we can hope that in future, either our own system or that of the hostile system will evolve features and forms that will render us less and less hostile to each other, that we will grow immune to the adverse effects we have on each other. After all, who can set the limits to the possibilities?

A study of integral yoga must take note of the significant difference between the yoga of Patanjali (Bryant, 2009) and that of Aurobindo (1999, 2005) and Chaudhuri (1965, 1977). In the Yoga Sutras Patanjali had defined yoga as *citta vritt nirodha* (sutra 1.2), which roughly translates as the stopping of the natural propensities of the mind or building a dam to withstand the advance of the mind's natural inclinations. This prescription shows *vritti* in a negative light whereas linguistically and historically it is not so. Vritti has a secular and a positive connotation. It means the natural qualities or character of any being, those which enable the object to survive. The vritti of a being is its dharma, that which sustains the being or the pursuit of which makes the being survivable, makes it feel fulfilled. It is somewhat similar to what Plato understood by the concept of "function", that species specific function by performing which alone a member of that species could be contented and happy.

Like barking in the case of a dog. Vritti thus has a positive import. Vritti is also understood to mean livelihood which is essential for survival. A monthly pension is also designated a vritti. *Chhatravritti* means scholarship, that which enables a student to survive and excel. The mantra for worship of the mother goddess specifically says: *Ya Devi sarvabhuteshu vritti rupen samsthita namastasyai namastasyai namastasyai namo namoh* (Our salutations to the Devi who is instilled in each creature as its way to live, Devi Mahatmya, Chandi, Devimantra (stotra 21). Vritti is what mother nature has equipped us with for survival in the struggle for existence. To exercise *nirodha* or preventive control against vritti would be to cripple the being. It would be an act of aggression against mother nature. Derivatively, *Vrita* is understood to mean someone who has been accepted as an honorable person. Vriti means *varana* or welcoming. It further means that which surrounds a being to protect it, like a fence or the outer skin of a flower. Vritta means circular or a mandala. *Vrittastha* means *prakitistha* or encircled, safely lodged in one's own nature and normal, natural. To be drunk or be grief-stricken would be to be *aprakitistha* or not acting normally as the person has been confused or dislodged from the natural self.

Thus Patanjali's definition of yoga as *cittavrittiniorodha* takes the shunning of nature as its point of its departure. Yoga is seen as a relentless and uninterrupted long practice that cultivates *vairagya* (detachment) and *vitrishna* (cessation of longing, recoil, a natural abhorrence or loathing) towards our natural propensities. Vairagya or dispassion/detachment is defined as *drishta* (seen)-*anushravika* (heard) *vishaya* (objects) *vitrishnasya* (repugnance) *vashikara* (taming, subduing) *samjna* (definition) *vairagyam* (dispassion, detachment) (sutra 1.15). It aims at rooting out the nature-given nature and replacing it with a being that we have made to be our second nature. We are ordered to stay in this new self, be grounded in it. From Vritti (nature) via *abhyasa* (practice of) *vairagyam* (detachment) to *savija samadhi* (meditative stage still pregnant with seeds or samskaras or imprints of nature) to *nirvicara* (void of discrimination, non-dual, devoid of multiplicity or diversity, sterile oneness) *adhyatma* (spirituality) *prasadah* (taste of divinity) is the route of Patanjali's yoga (Sutra1.47). For him, truth and wisdom lie only here: *Ritam* (truth) *bhara* (filled) *tatra* (there) *prajna* (wisdom) (Sutra 1.48).

By contrast, integral yoga seeks not to eliminate nature from its path of integration. It is inclusive of the earthly and the sensory world that is Nature, of *Maya* (illusion) and *Leela* (play) as divine forces at play in creation. It thinks of conflict, pain and turmoil as essential ingredients in the process of transformation of being. It is not a journey towards a non-dual, distinction-less self-sameness but it is set upon achieving unity in the middle of diversity. It finds wholeness to be the original, natural state of being and aims at restoring the balance whenever it is off. It treats turbulence as a natural, necessary condition of the process of self-development and hence it treats every conflict, every error with care, compassion and reverence as a stage in the self-manifestation of the spirit of Nature. It is more in tune with the twenty eight stotras of the Devi Mantra in Devi Mahatmya which enumerate all of the following (stotras 7 to 26) as a seat of the Devi:

Table 1: Twenty Eight Stotras of the Devi Mantra

cetana or consciousness	*buddhi* or the intellect	*nidra* or sleep/rest
kshudha or hunger	*chhaya* or shade	*shakti* or strength
trishna or thirst, craving	*khshanti* or forgiveness	*jati* or multiple species
lajja or modesty	*shanti* or peace	*shraddha* or reverence
kanti or form	*Lakshmi* or grace, prosperity, wealth	*vritti* or livelihood, dharma
smriti or past impressions, memory	*daya* or compassion	*tushti* or contentment
matri or the mother	*bhranti* or error, confusion, lost, disoriented	

In the end the mantra celebrates the Devi as residing in all of our senses (*indriyanam adhisthatri*) in the form of ever-present consciousness (*citirupen*). The Devi Mantra is recited in the Durga Puja which is an inseparable part of the Bengali Hindu tradition. Both Aurobindo and Chaudhuri were sons of Bengal. No wonder they carried within the core of their being the reverence for Nature.

Searching the roots of the word ‘integral’ takes us back to the sheepherder days of Europe and the times of the emergence of the tango dance. The opposite of integrate is often said to be segregate, which means to set apart from the flock. Sheep are gregarious animals; they tend to live in flocks, which are integrated wholes. Greg (stem of Latin grex) means flock. So when a sheep is lost, it is segregated, torn apart from its flock. The sheepherder tries to reunite it to its flock. It was whole to begin with, then it loses its wholeness and the task ahead is to restore it to its wholeness.

A study of the history of tango reveals some thought processes that can be of interest to students of integral philosophy (Denniston, 2007). In Spanish *tener* and *tengo* mean to have and to hold in one’s hands, the Latin being *teneo*. *Tangere* means to touch.“*Noli me tangere*”, meaning “Touch me not”, are the famous words ascribed to Jesus as being said by him to Mary Magdalene when she recognized him after resurrection and proceeded to touch him. Many have felt that there is something forbidding about touching. Touching may be seen as violating privacy, as going against conservation and preservation, as a denial of one’s basic right to be left alone. The phrase ‘*Noli Me Tangere’* subsequently was borrowed by the notable Filipino nationalist author Jose Rizal as the title of his novel *Noli Me Tangere* (Rizal, 2006) in which he protested the Spanish colonization of his country. A colonizing people take away from the purity and wholeness of the original state of the country and its inhabitants when they establish their own invasive settlements. Rizal got his inspiration for writing the book from Harriet Stowe’s novel Uncle Tom’s Cabin which illustrated how the white colonizers stripped the African slaves of their natural state of wholeness.

Tango as a form of dance involves partners holding hands and holding each other in close proximity. There is something about touching that has been held to be impure in many cultures. In India one had to take a bath if one inadvertently touched a person of a lower caste. Hence the term "untouchable". The fear of impurity traveling via touch was so much that one had to wash oneself even if the shadow of an untouchable was traversed. This fear is reflected in words like "contagious" ("*tag*" meaning to touch" in Latin") which indicate that some germs spread through touch so precautions against such diseases include avoidance of touch. It is pertinent here to mention that Noli Me Tangere was also used to refer to cancer of the eyelid to state that the eye is not for touching. Jose Rizal was an opthalmologist who was aware of this disease of the eye and the phrase Noli Me Tangere must have come readily to him. Even today, eye ailments and drugs use "Do not touch me" as a catchy phrase for their advertisements.

The idea that touching was morally impure had thrived in Europe until as late as the early and mid-nineteenth centuries. Prior to the introduction of the tango, dance in Europe was mainly contra-danza, in which partners stood facing each other, making lineal movements and only occasionally touching each other's hands. It was similar to English country-dancing. There were circular forms of dancing as well which too involved no touching. The introduction of Walz was the first advance made towards dancing that involved close holding of partners. It was around 1850 that that the Opera of Paris first introduced Waltz as a risky venture but it turned out to be successful. Waltz was followed by Polka. The European elite was gradually relenting upon its idea that social touching while dancing was not morally condemnable. During the introduction of the tango in Argentina around 1880, men often had to dance with men to avoid social stigma or the unavailability of socially acceptable women in Argentina at the time. Such male and male partnership had nothing to do with homosexuality. It was the avoidance of morally impure and socially unsanctioned behavior by men and women towards each other. Tango involving men and women as partners was danced mostly in brothels in the early days. By 1930, however, tango had gained respectability and the rich Argentinians had introduced it to Europe as an acceptable and enjoyable dance.

Why was touching considered to be not desirable? It was not simply because touching could spread germs. It was also because touching could "take away" from things as well as "give" to things. If we touch a delicate flower or a lettuce leaf frequently, it will noticeably wilt. If we hold a baby for long periods of time it may interfere with the baby's free growth. Perhaps our body heat takes something away in such cases. Perhaps it is like sleeping on a sofa where the free movement of one arm is impeded and the body does not feel fully rested after the sleep. Touch does take away from wholeness in some cases and in such instances wholeness is seen as the natural condition. But touch also gives. It gives comfort, it nourishes. It expresses caring. Yes, it can arouse improper sexual arousal in men and women, but where sexual closeness is desired by the partners, touch can be deemed divine. Thus touch has restorative and creative qualities as well. If what was whole has been made to be less than whole, touch can restore it back to wholeness. Thus it can act as an essential ingredient in the process of integration, in the creation and preservation of integral lives.

The word 'integrate', though used as the opposite of 'segregate', unlike the latter, does not have its roots in "greg", which means group or flock. It is broken down to in (in the sense of no, non)-tegr(touch)-ate(to cause). It means to cause not to touch. That would be a way to preserve the natural state of wholeness of the object concerned.

Tangere, *teg*, *tegere*, *tag*, *tect*, *tact*, *texi* are related words that can mean touch, feel, hold, try, reach, handle, evaluate, estimate, measure etc. in different contexts (Morwood, 1998). They refer explicitly or implicitly to the skin. The Sanskrit word for skin is *twak*, showing how ancient the concern is about touch. It is curious to note that teg and tect can also mean protective cover, like a shell enclosing a nut to keep it whole or a shell protecting a tortoise. A million other instances can be found in nature of how covers are intended to protect the pristine quality of things. Hence to pro-tect is to work for the preservation of the cover enveloping the original wholeness of things and to de-tect is to take away the cover and expose it to the outside world.

The prefix "in" too can have not just a forbidding import but may also mean to preserve something in its essential state. It has an inclusive and an exclusive sense. Hence in-tegr-ate can also mean to cause something to remain protected in its original state of wholeness. Do not touch or play with the cover for it sheaths the essential quality of the object, that which makes it viable, its sacred soul, that is. In this context Bahman Shirazi's words appear very relevant. In his article *Integral Education: Founding Vision and Principles* (Shirazi, 2011), he remarks that balance and harmony are the ultimate laws of life. The observation can be made into a very pursuable goal in life if we remember that only harmony can bring balance in any given situation. However, it is also worth its while to remember that while harmony is an important goal to pursue, balance, on occasions may not be so. In matters of love and compassion, we can on occasion witness grand extravaganza. Aurobindo Ghosh spoke of Leela or playfulness as the source of the bursting forth of all creation. Leela, the divine's pleasure, the delight the divine takes, in endlessly expressing itself in multitudinous forms is also termed *Ichchha* or the creator's pleasure. It applies also to the child's play, the sheer delight a child takes in playfully releasing its energy and create objects of fantasy out of it limitless imagination. Hence the word *Leela-khela*; Hence also the name *Ichchhamayee Tara* for the Goddess and the name *Ichhamati* for the ever-flowing river at the border of West Bengal and East Bengal (Bangladesh). Its dharma is to flow on and on and make its path and bring life to the elements that form its bank. It knows not what it does, cares not what pitfalls may arise on its path. Absorbed in its creativity it continues to flow. Perhaps this is what Aurobindo meant when he thought of the Infinite losing itself in the finite, leaving itself concealed in the finite that it generates out of itself. Perhaps it is not appropriate to call the created finite. For each finite conceals within itself the imprint of the infinite which gives it its original wholeness the loss or impairment of which stirs in it the unrest causing it to launch upon the journey to restore its wholeness to itself. Shirazi also states that people have an innate potential for wholeness and an urge to attain it. He maintains that all human beings have a right to be whole because wholeness is at the core of all human beings and that therefore healing can occur only if wholeness has been restored to someone suffering. I could not agree more with these forceful assertions. Only, I would like to extend the area of these affirmations from the human realm to all that is, to being as such. *Sat* or simple being transforms into *chit* or consciousness which in turn rises to the experience of *ananda* or joyfulness.

To believe in integralism is to be dynamic. It is not to be locked away in an eternal state of stagnation. It is to believe that wholeness is a natural state of all that is, that which makes being, be at its best. However, it also looks upon losing of wholeness in the process of creation and life playing itself out as equally natural. It further believes that the restoration of wholeness is dharma for disintegration is the darkest hour and must be turned around to be productive of new integration. This is of the essence of Faith and Hope. This is made possible by the sharing of wholeness by those who have attained it, by self-erosion, by self-exposure, by giving of oneself at the cost of losing oneself. This is what Charity is. Fortunately, such self-giving not only restores wholeness to others, but also leads to regaining it for oneself.

Individuation, Cosmogenesis and Technology: Sri Aurobindo And Gilbert Simondon

Debashish Banerji[1]

Abstract: The turn of the 19th/20th centuries saw a number of philosophers of conscious evolution emerging from different cultural backgrounds. This paper argues that this phenomenon, which has sometimes been seen as a philosophical consequence of Darwin's evolutionary theory in the life sciences, is more importantly related to the enhanced scope of human subjectivity made possible by technology at this time. Yet technology remains the "unthought within the thought" of its times, an ambiguous presence, derided for its alienating effects and praised for its enhancement of human capacities and comforts. A later generation of thinkers, belonging to the post World War II era renews the thought of conscious evolution, now in engagement with new technologies of a planet spanning scope. This essay considers the ideas of these two generations of thinkers, focusing on Sri Aurobindo (1872-1950) from the earlier generation and Gilbert Simondon (1924-1989) from the more recent era, questioning the consequences of contemporary technology in their thoughts, goals and practices. In developing the historical continuity of ideas, it tracks the question of technology from the earlier to the later generation, highlighting the understanding of both its promise and its ills and engaging with it the possibilities of conscious evolution.

Key Words: Conscious Evolution, Cosmogenesis, Cosmogenetic Individuation**,** Gilbert Simondon, Henri Bergson, Marshall McLuhan, Sri Aurobindo, Technology, Teilhard de Chardin.

Cosmogenetic Individuation

The turn of the 19th/20th centuries saw an implementation of what has been called the Second Industrial Revolution marked by universal electrification, mass production and the birth of the world market. This brought the post-Enlightenment episteme into the properly modern phase of its actualization, the practical horizon of a global humanity. For the first time in human history the assumption of a species identity for all humans and the yoking of all humanity in a common global life made itself a ubiquitous anthropological possibility. The ontological consequences of

such an epistemic change were dimly grasped by the leading thinkers of the time, in their varied ramifications. These included ideas which projected a global expansion of human subjectivity, read retrospectively back to cosmogenetic processes.

It should be noted that Enlightenment philosophies had already arrived at a formalization of an evolutionary ideology in Hegel’s philosophy of history, which saw an involved rationality in Matter and a cosmic Time Spirit (*zeitgeist*) working out its experiments in synthesizing opposites towards the emergence of the Logos as free thought in social and political life (Hegel, 1975). It is important to note that creature agency is undervalued in this process, the progressive experiments of the *zeitgeist* leave their results culturally fossilized moving on to other "races" (an east-to-west drift) and human subjectivity remains bounded within predetermined limits.

Nietzsche's refusal of ideological truths on the grounds of their being historically contingent and politically established and his exaltation of human agency as an effect of a cosmogenetic will to power was largely a reaction to Hegel's deterministic evolutionism. The new evolutionary philosophies which arose through the last decades of the 19th century and over the first half of the 20th century were closer, in this regard to Nietzsche in positing immanent forms of evolution in which creature/human agency played a key part and human subjectivity underwent radical change/expansion. It should also be noted that such philosophies arose in the wake of Darwinian evolution, but whereas the latter was restricted to morphological change based on anatomico-functional adaptations in which agency or consciousness played no part, the new philosophies recognized changes in consciousness underlying evolutionary processes and resulting from immanent ideas actualized through acts of will.

Three such thinkers of this period are the two Frenchmen, Henri Bergson (1859-1941) and Pierre Teilhard de Chardin (1881-1955) and the Indian, Sri Aurobindo (1872-1950). In looking for a common key to describe the works of these thinkers, I would use the phrase "cosmogenetic individuation." "Cosmogenesis" is a term used by Teilhard (1959) to refer to a process of increasing complexity, self-organization and self-awareness of the cosmos. "Individuation" seems more common it its usage but deceptive due to its varied connotations and inflections. Presently, this term is more usually associated with C. G. Jung (1971), a psychological emergence of singular personhood out of the amorphous Unconscious and its movement towards universalization. Though such a process could have practical similarities with individuation as theorized by more recent philosophers like Gilbert Simondon (1924-1989) (Simondon, 2005; Scott: 2014) and Gilles Deleuze (1925-1995) (Deleuze, 1995), these latter include an ontological foundation to individuation which is absent in Jung. Bergson (1988) uses the term to refer to creative differentiation of instances, and Teilhard and Sri Aurobindo, though they don't explicitly use the term, refer to ontogenetic processes akin to individuation. Teilhard (1959), for example, writes of hominization, personalization, anthropogenesis and christogenesis, as roughly synonymous terms to a becoming-individual of the cosmos, while a similar evolution towards universalization of the person-element (*purusha*) in the cosmos is envisaged by Sri Aurobindo (2005, pp. 922-952) in what he calls psychisization.

Metaphysics of Conscious Evolution

In Teilhard (1959) and Sri Aurobindo (2005) a cosmic/transcendental principle (*noosphere* or Supermind respectively) is immanent in all entities in the cosmos, and seeks to individuate itself through them. In the case of Bergson (1988), a creative immanent consciousness in the cosmos and all its creatures, the *élan vital*, multiplies diversity and pushes towards an increasing complexity that can be intuited and be the source of knowledge and action in each of its creatures according to their orientation and capacity. However, though such an ontogenetic foundation evades the hubris of anthropocentrism, it empowers the individual, variously locating the evolutionary will as creature agency.

This is where these thinkers differ from philosophers of deterministic history, such as Hegel, for whom cosmogenetic agency, even when immanent, can be said to be located in a transcendence within the immanence. In these thinkers, one finds both these dimensions of transcendence and immanence assuming active potency, along a gradient in which Teilhard can be seen as slanted closer to the transcendence and Bergson towards the immanence. Thus all these thinkers can be thought of as panentheistic in various ways. Of the three, Sri Aurobindo, while acknowledging an immune transcendence, yet posits two other forms of self-perception of this transcendence, an objectified self-perception (Matter as cosmic immanence of the Subject); and a self-multiplied prospection as every individual possibility within this immanence, or in other words, the complete immanence of conscious Being (Brahman) in every particle of the material cosmos, thus representing individual agency in conjunction with cosmic agency (Sri Aurobindo, 2005, pp. 309-335). While individual agency has been secondary to cosmic agency ("Nature") prior to the appearance of the human, individualized consciousness in the human represents a new level of independence from cosmic agency and thus able to determine its own destiny superseding Nature's will (Sri Aurobindo, 2005, pp. 856-879).

Sri Aurobindo's theological metaphysics has profound correspondences with Teilhard's Christology, founded on an exile and redemption mythos. In Teilhard's mystical Christology, the "redemption" is not "completed" by the historical personage of Christ, but this historical event becomes a symbolic promise for its multiplied realization in human individuals leading to a cosmic "return" through Christogenesis in the individualized collective realization of the "Omega Point” (Teilhard de Chardin, 2001). The separation from Origin implied in a mythos of exile is also present in Sri Aurobindo, though, founded in the Vedic theme of Sacrifice as expressed in the Purusha Sukta, such a separation is not an "act of Evil" burdened on the human and thus requiring redemption, but rather an "act of God" on the body of God, and thus a self-sacrifice, leading to an ontology of Separation in which, nevertheless, the One becomes self-multiplied as monadic immanence (Sri Aurobindo, 1999, p.106; Alfassa, 1977/2004, p.74). Similarly, instead of "redemption" then, the evolutionary drift of such a cosmic condition would be a recovery of cosmic and transcendental Oneness through identification of each individual with the fullness of Purusha, reconstituting its sacrificed Body in a collective manifestation which Sri Aurobindo referred to as a "divine life" on earth (Sri Aurobindo, 2005, pp. 1051-1108).

However, as mentioned in the previous paragraph, individual agency coexists with cosmic agency in Sri Aurobindo's metaphysics. This implies a theology in which the Vedic Sacrifice of Purusha is accompanied (in fact, preceded) by the Sacrifice of Prakriti, creating the substantial and operational cosmic condition of Inconscience in which the fragmented dismemberment of Purusha may seed itself (Sri Aurobindo, 2012, p.17). This cosmic latency of Consciousness self-constrained as Inconscience becomes the basis for the evolution of Nature. According to Sri Aurobindo, all evolution is accomplished through the double process of memorial aspiration (ascent of consciousness) and responsive Grace (descent of consciousness) (Sri Aurobindo, 2012, p.3; Sri Aurobindo, 2005, pp.730-753). The stirrings of the memory of Consciousness within the Inconscient turn into an ascending aspiration which invokes the "descent" of successive gradations of Consciousness, each with its characteristic properties marking its difference in kind. Such a successive gradation of Consciousness in Nature (Prakriti) based in the Inconscience of Matter affords increasing possibilities of freedom and self-manifestation (*swayambhu*) to the individualized immanence of Purusha in each of its dispersed units. Thus the evolution of Prakriti affords the evolution of Purusha (Sri Aurobindo, 2005, pp. 272-274).

Evolution and Psychological Praxis of Sri Aurobindo

The Purusha is present in the particulate appearance of Matter as physical or material purusha; in discrete Life forms as vital purusha and with the appearance of Mind, as mental purusha. Each of these successive forms of purusha is more "awake" than its predecessor, better able to experience its freedom and sovereignty from its constraining bounds of prakriti. In the human, the co-existence of physical, vital and mental prakriti implies the triple presence of physical, vital and mental purushas, a compound existence in which the freedom of the intelligence (*buddhi*) from the rest of the human constitution enables a higher degree of potential freedom of the mental purusha amounting to the possibility of a transcendence of Nature (Sri Aurobindo, 2005, pp. 856-879). Such a possibility of purusha's freedom in one of the constituents of prakriti results in what may be called an anthropogenesis, a new form of ontogenesis (it should be noted that ontogenesis and anthropogenesis are terms more common to Teilhard than Sri Aurobindo; nevertheless, I have used these terms since I feel them to be appropriate). This anthropogenesis is the birth of personhood, described by Sri Aurobindo in terms of the appearance of a new and more centralized dimension of immanent purusha in the human, capable of integrating the physical, vital and mental purushas and called by him "psychic being" or "soul personality". At this point, Purusha's evolution is capable of taking an independent turn, no longer dependent on the evolution of Prakriti but able to transcend, master and transform Prakriti (Sri Aurobindo, 2005) .

Being free of the burden of guilt, Sri Aurobindo's evolutionary monadology may be seen as an individualized "adventure of consciousness and joy," and in this respect closer to Bergson's (and Nietzsche's) personal exercise of a cosmic creativity (*élan vital*). It is also in this respect, that such an exercise of personal creative will has been theorized by Sri Aurobindo as a praxis discursively continuous with long traditions of Indian yoga (Sri Aurobindo, 1999, pp. 41-52). Thus, of these three thinkers, Sri Aurobindo provides the most developed methodology for a cosmic and transcendental expansion of (post)human personhood, based in the capacities of the source of individuation, the psychic being, to integrate the personality, identify itself with cosmic being (Overmind) and finally transcend cosmic existence in an identity with a transcendental source, the Supermind (Sri Aurobindo, 2005, pp. 922-952). Sri Aurobindo refers to this process as "the triple transformation". Yet, as one can see from the above, such a process is intensely psychological, a "practical psychology" (Sri Aurobindo, 1999, p. 44) as Sri Aurobindo terms it, which seems to minimize or invalidate any concern for social or cultural conditions.

Such an appearance, however, is misleading and arises due to the disciplinary specialization of discourse as an epistemic aspect of modernity. We have noted how Sri Aurobindo's metaphysics involves relationally, the evolution of universal conditions (prakriti) and individuation of consciousness (purusha). This relationality does not disappear with the emergence of the human. If the practical psychology of the triple transformation is concerned primarily with ontic evolution of the Purusha as outlined in Sri Aurobindo's philosophical *(The Life Divine*, Sri Aurobindo, 2005) and "yogic" *(The Synthesis of Yoga*, Sri Aurobindo, 1999) works, Sri Aurobindo's social and political texts delineate the continuing evolution of prakriti at the level of human society, moving towards global conditions of human unity, a trajectory fraught not merely with promise but danger, needing political and ethical negotiation through its relationship with human agency (Sri Aurobindo, 1997). But the implications of such ethical and political agency are easily lost sight of, due to the above-mentioned separation of his social and psychological texts and the privileging of the latter over the former.

Social Praxis and Technology

This continuing evolution of prakriti at the level of human society and civilization in its varied relations with human choices (evolution of purusha) can be elaborated into a critique of modernity, something Sri Aurobindo himself undertakes to some extent in his social and political texts (Sri Aurobindo, 1997, pp. 15-221). He presages a phase of globalization led by capital, and outlines the dangers of "economic barbarism" and fascist politics (pp. 44-54; pp. 73-81). He predicts the eventuality of a world government and analyzes the struggles of individual and subcultural agency in the face of homogenizing or hegemonizing tendencies (pp. 279-578). He stages the opposition of superpower politics and federalist participation (pp. 505-547). He sees the importance of promoting the forces of fraternity and internationalism over the ideological investments of state controlled planning or aggressive nativism or religious fundamentalism (pp. 548-570). At the microsocial level of the individual and the community, he promotes increasing autonomy with direct individual participation in shaping the communitarian life moving in the direction of a spiritual anarchy. Yet, as I discuss in the next paragraph, the ubiquitous mediation of technology as the sign of contemporaneity, emerging after his time, is not independently addressed by Sri Aurobindo.

While a comparative study of these three thinkers would be very interesting (and has been attempted in part by several scholars) what concerns me in this essay is the contemporary relevance of the paradigm or episteme that finds form in these thinkers. In this regard it is the unthought within the thought, the obvious medium of existence that often makes possible the perception of an idea but remains invisible or imperceptible, and concretizes itself over time demanding a new engagement. Such is the place of technology in the articulation of these thinkers. One may say that the question of human subjectivity and its transformations (the "who") accompanies the thought of post-Enlightenment modernity from its inception as part of its anthropological project. But it is tied to the question of the transformation of the world (the "what") as it arises from its knowledge (science).

This project of world transformation is attributed to the application of science; i.e. technology—and thus the appearance of new assessments of the relation of human subjectivity to the cosmos with the advent of new technologies is almost to be expected. Yet the possibilities opened up by the new technologies on human consciousness are elided in the new philosophies of conscious evolution and/or the evolution of consciousness. To be fair to these philosophers, it isn't as if they ignore the advances of science and technology. Along with other humanistic thinkers of this period, they hold an ambiguous view of technology, part critique of its alienating and destructive effects from/on nature and part admiration for its productive and world-uniting possibilities. But technology does not receive a systematic treatment in relation to the possibilities of human consciousness from any of these thinkers.

Heidegger and the Question Concerning Technology

Indeed, it is only after the passing of this generation of thinkers and more properly from the 1960s that technology becomes increasingly addressed with reference to consciousness, due to its ontological ubiquity. Perhaps the first serious and systematic consideration of this kind was Martin Heidegger's essay "The Question Concerning Technology" published in 1954 (Heidegger, 1982). In this essay, Heidegger seeks out the "essence of technology" and finds it not in technology itself but in the kind of revealing it makes possible. Heidegger relates technology, in its essence to fabrication, a "making" which is "indebted" to four kinds of "causes"—the earth as a provider of raw materials, a form of self-disclosure and gifting in relationship to the human (material cause); the history of cultural forms, related to the function it serves (formal cause); the larger contextual goal or terminal function within which the fabricated object serves its function, ultimately a sacralizing or sacrificing to a transcendent realm or order (final cause); and the human fashioner who addresses all these causes and shapes the functional object (efficient cause) (Heidegger, 1982, p. 6).

Attention to all these causes or "obligations"/"debts" makes the work of technology (*techne*) equivalent to a work of art, or invoking Heidegger's Greek term, *poeisis* (Heidegger, 1982, pp. 8, 34). Modern technology, Heidegger avers, does not respect the material cause or final cause. It challenges and sets itself upon the earth and it ignores the sacralizing function of aspiring for the Transcendent (pp. 9-10). Heidegger uses two terms, "enframing" (*gestell*) and "standing reserve" (*bestand*) to describe the alienating and violent form of disclosure involved in modern technology (Heidegger, 1982, pp. 11-13), marked by information exploitation, ordering all subjects and objects in the cosmos as static resources always available to be put to one's bidding.

This alienation from the temporality or seasonality of the earth and its power to disclose the self-manifestation of Being; as well as its rupture from the sacred sphere is the chronic malaise of our times, the epistemic violence of modern technology. Enframing thus refers to an attempt at a spatial reduction of cosmic contents, a mode of existence in which all things are objectified as resource, shorn of the mystery of temporal disclosure. Standing reserve is another way of addressing the status of beings or subjects thus reduced, objectified, commodified and exploited. As a mode of existence therefore, modern technology is seen by Heidegger as modernity's episteme, utilizing the methodology and systemic objectifying descriptology of science to "gather" reality into a single flattened frame so as to order its contents at will (Heidegger, 1982, p.17).

Such an ontological critique of technology puts us in view at once of both the globalization and alienation of our times. An abstract absolute description of the world usurps the place of the world. Modern and contemporary continental philosophy leans heavily on this insight of Heidegger. It becomes the basis for Habermas' "colonization of the lifeworld" (Habermas 1984), and of Jean Baudrillard's "virtual reality" (Baudrillard, 1994). Looked at in terms closer to us, in the key of contemporary technology which Heidegger was not privy to, one could say that what Heidegger describes here is a mode of existence where reality is perceived as an omni-database with all entities classified and organized in terms of their relations and properties, waiting to be "harvested," "utilized" or "exploited" by whoever had power to access this construct. Undoubtedly, such a view seems bleak, holding little comfort or positive potential for human subjectivity.

In relation to the philosophers of conscious evolution I started with, if human subjects are brought without exception under a regime of objectification and potential exploitation, they have little wriggle room to expand subjectively and the promise of an integration and cosmisization of the human subject would seem an impossibility. Of course, such an ontology would also be uneven affording degrees of freedom and privilege in access and exploitation of the "standing reserve." But under an universal ontology, even such subject positions of privilege in power and capital would be constrained to the maintenance of the ontological order. Heidegger's appeal is a return to *poeisis*, respect for the four causes or debts that human beings find themselves embedded in all their fabrications *(homo faber)* or technological undertakings *(techne)*. This would need a "wresting" of agency from the established order of our times and the re-establishment of a more "authentic" mode of existence in the individual and the collective, the creation of a new "I" and "we" that resists the automatic gravitation of slippage into the "they" (Heidegger, 1962, p. 415).

Apart from this foregrounding of technology as the epistemic ontology of our times, in situating beings existentially within a temporal horizon constituted by the self-disclosure of Being, Heidegger created a language that folded interiority in historicity, thus articulating simultaneously the realities of individual and society. The wresting of *poeisis* from an objectified *techne* is a praxis historically embedded within the modern horizon of Being. Such a praxis can be related to the practical psychology of yoga, a revolutionary transformation of subjective consciousness making possible a new horizon of Being's self-disclosure. This overcoming of the disciplinary specialization and separation of psychological and sociological studies marked a departure from the considerations of an earlier generation, like that of the philosophers of creative evolution we have considered, such as Sri Aurobindo, whose works had been produced in disciplinary isolation, as mentioned above, much to their detriment. Continental philosophers, such as Michel Foucault, Jacques Derrida, Pierre Bourdieu and Gilles Deleuze, who have followed in the wake of Heidegger, have continued an articulation that undercuts such disciplinary boundaries.

Heidegger's originality and break with the past may also be seen in his rejection of metaphysical idealism in favor of an ontology grounded in phenomenology. This turn in Heidegger may more properly be credited to his teacher, Edmund Husserl, the father of modern phenomenology, who felt that the modern domination of epistemology by science could no longer be overlooked by philosophy, which needed, in response to refuse metaphysical speculation but also to eschew science's privileged objectification. Heidegger takes one step further in overcoming the subject-object dualism through his ontology and thus inaugurates a trend in which the critique of and break with metaphysics is treated as final.

Thinkers such as Foucault and Derrida, following in the wake of Heidegger and largely in continuation of his work, have shied away not only from metaphysics but also from ontology as a result, more concerned to situate ontology in historical and political determination. Among this generation of important late 20th century continental thinkers, only Gilles Deleuze, influenced strongly by Bergson, has continued to address metaphysics and ontology, but from a vantage of empiricism and ontogenesis. As a result, Deleuze can be constellated in important ways with our philosophers of evolution. However, I am not including a consideration of his ideas here, except where relevant, because though he has commented on technology in our times, this is not one of his primary concerns. On the other hand, he was profoundly influenced by a contemporary of his, Gilbert Simondon, who engaged deeply with the question of technology, and in this essay I wish to relate the ideas of conscious evolution to Simondon's thinking on ontogenesis and technology.

McLuhan: Media Technology and Consciousness

However, before that, in thinking of a later generation who have engaged the ideas of the philosophers of conscious evolution with the ubiquity and ontology of modern technology, one must consider the Canadian philosopher of media technology, Marshall McLuhan (1911-1980). Both McLuhan and Simondon may be seen to have direct links to the philosophers of conscious evolution—McLuhan to Teilhard de Chardin and Simondon to Bergson. Though McLuhan did not directly reference Teilhard, the cultural critic Tom Wolfe (2011) has pointed to the pervasive influence and substructural presence of Teilhard's ideas in McLuhan's insights on media. McLuhan is responsible for a large number of neologisms that have become current in contemporary popular culture, three of his most well-known phrases being "global village," the distinction between "hot and cool media (McLuhan, 1964, p. 22)" and "the medium is the message ," later further finessed as the book title *The Medium is the Massage* (McLuhan & Fiore, Q, 1967).

Regarding technology both as an exteriorization and amputation of human organs and capacities, such as the nervous system or the memory (McLuhan, 1964, p. 11), McLuhan articulated many of the ideas that have led to contemporary posthumanist thought. In seeing new technologies as amputations of human capacity, he was echoing Plato's concerns with "writing" as a technology leading to the attenuation and eventual loss of human memory (*Phaedrus*), but this was counterbalanced, for McLuhan, by the global expansion of collective consciousness made possible by technologies of communication, transportation and exchange. Yet, though the gains of collective consciousness were promising, the natural attenuation of individual capacities and the subjection of the individual to mass determinants were problematic consequences of technology that McLuhan was much concerned about all his life.

He saw and wrote of the subject altering powers of media arising from new equations and engagements of the human sensory system (McLuhan, 1962, p. 41), and reinflected this idea more powerfully in terms of ontological subjection in the tweaked variant "the medium is the massage." One can easily see the extended mileage of this idea in contemporary posthumanist thought, as in Katherine Hayles' books *How we Became Posthuman* (Hayles, 1999) or *My Mother was a Computer* (Hayles, 2005). McLuhan was developing his ideas in a world dominated by television, and died in 1980, prior to the emergence of the desktop computer and long before the appearance of the World Wide Web. Yet, his pronouncements predict a world characterized by these developments in the 1960s. He discussed the ontological changes related to transitions of dominant media from print through film and television to multimedia and interdependent computing, coining the phrase "global village" to describe the last phase. In his text *The Gutenberg Galaxy: The Making of Typographic Man*, (McLuhan, 1962) he describes the promises and dangers of such a society:

> Instead of tending towards a vast Alexandrian library the world has become a computer, an electronic brain, exactly as an infantile piece of science fiction. And as our senses have gone outside us, Big Brother goes inside. So, unless aware of this dynamic, we shall at once move into a phase of panic terrors, exactly befitting a small world of tribal drums, total interdependence, and superimposed co-existence. [...] Terror is the normal state of any oral society, for in it everything affects everything all the time. [...] In our long striving to recover for the Western world a unity of sensibility and of thought and feeling we have no more been prepared to accept the tribal consequences of such unity than we were ready for the fragmentation of the human psyche by print culture. (p. 32)

One can see here the recovery of a collective human unity, now extended to a global dimension, out of the fragmentation implied in the complexification of tribal culture with the ascendance of civilization, marked as per McLuhan by print media and its subjective correlate of individualism. But at the same time it is a return of subjective inundation by mass behaviors and instincts (tribal drums), lowest common denominators of consciousness (terrors) and surveillance and control by corporate or ideological authority (Big Brother). Behind this global culture one may intuit the cosmogenesis of Teilhard, a materialization of a cosmic consciousness or noosphere mediated by technology. Yet, for Teilhard, such a collective dimension could only be a stage in anthropogenesis, a precursor to christogenesis, or the generation of a cosmic and transcendental individual in each person. McLuhan could perceive the dangers and difficulties towards this eventuation, its easy derailment under the powers of subjection conditioning individuals more ubiquitously than ever before.

In response, he sought ways to maximize creative expression under these circumstances, indicating conditions and practices enabling agency, engagement and the autonomy and expansion of subjectivity. It is in such a context that, in his text *Understanding Media* (McLuhan, 1964, p.22), he distinguished between "hot and cool media," media which enabled consumption and disabled participation (hot) as against those that were intrinsically interactive (cool). Interestingly, he classes movies as being hot and television as cool, due to the latter needing more mental and emotional interactive response than the former. Today, such a distinction seems odd in the context of television, to which we more commonly attribute the function of producing "couch potatos." However, the distinction could be seen as valuable in general for our consideration. McLuhan was not blind to the relative scale of these terms and displays his prescience once again when he compares television and multimedia computing:

> The next medium, whatever it is—it may be the extension of consciousness—will include television as its content, not as its environment, and will transform television into an art form. A computer as a research and communication instrument could enhance retrieval, obsolesce mass library organization, retrieve the individual's encyclopedic function and flip into a private line to speedily tailored data of a saleable kind. (McLuhan, 1995, p.221)

When compared to Heidegger, we see that McLuhan does not subscribe to the former's unrelieved pessimism, though he is not naive about the detrimental effects of conditioning and state or corporate control implied by contemporary technology. Instead he opens the possibility of achieving a Teilhardian vision of collective noogenesis through new technologies. This promissory note extended by McLuhan has informed a number of contemporary techno-optimists, who feel that the World Wide Web in conjunction with other global telecommunication technologies, has inaugurated a new utopian age for humankind. In Gilbert Simondon, we will see another late 20th century contemporary of McLuhan who holds out similar horizons for the human future, albeit with greater nuance and further reach. The question of human subjectivity inaugurated by Heidegger in terms of modern ontology remains, however. To what extent are human beings available to realize such a promise, or are they all the better transformed into fodder bereft of agency within enormous global systems of surveillance, classification, control and use, conditioned to believe that they are happy and free through technologies of persuasion and invisibility, as predicted by Gilles Deleuze (1992) in his *Postscript on the Societies* of *Control*?

Simondon’s Ontogenetic Metaphysics

Gilbert Simondon (1924-1989) is undoubtedly the most sophisticated of the late 20th century philosophers of technology, who have continued in the wake of the early 20th century philosophers of evolution. As mentioned before, he was influenced by Bergson, whose idea of creative evolution and inventive fertility of becoming receives an updated treatment contemporary with a constellation of more recent concepts associated with modern science such as immanence, emergence, systems theory, chaos theory, information theory, cybernetics and self-reguling systems (Barthélémy 2005). This is not to say that Simondon drew from these concepts, rather he represents a milieu of thought in which such concepts were emerging and have since become current. As per my characterization towards the beginning of this article, the central idea in Simondon's oeuvre could be delineated as "cosmogenetic individuation." In keeping with the post-Husserlian dictum in philosophy to keep away from idealistic metaphysics, Simondon does not develop an elaborate theory grounding becoming in a transcendent principle or choice, as does Teilhard or Sri Aurobindo. Rather, he positions the structures of becoming within becoming itself, proceeding empirically to verify and describe his ontogenetic processes. In this however, he is not too far from Sri Aurobindo, whose metaphysics is based in a praxis of transformation which can be equally made an empirical basis for participation in a "cosmogenetic individuation."

Simondon's process metaphysics deals with a pure immanence of becoming. In his thought, a stable unitary Being would remain transcendent and be incapable of manifestation. On the other hand, a purely unstable being would lead to a chaotic manifestation. Instead he posits a "metastable" Being, "more than a unity and an identity," in other words marked by a radical excess, which can double itself through a phase-shift (referred to by Simondon as "disparation") and thus generate gradients of exchange between two heterogeneous series, which are problematic fields of becoming (Simondon, 1989/2007). Each solution to such a problem would be a singular individuation, that would remain in metastable equilibrium with the larger field or problematic (the milieu) and the totality of the metastable being (preindividual being). Though relatively stable at the point of individuation, each individuated being and its milieu would remain capable of further individuation due to its continued metastability in relation to preindividual being.

Such further individuations may push an individuated being into another order of solutions belonging to a different problematic gradient, expressing new properties and degrees of freedom and agency. The information exchange along each gradient of becoming would be modulated by the properties of the medium of exchange, thus determining commonalities, degrees of variance and boundaries of each order of individuation. Simondon referred to these information transfers leading to resolution and individuation as "transduction." Thus individuation remained an "open" and ever-unfinished process, representing a negentropic tendency of Being generating ever higher orders of cosmogenetic individual and collective becoming.

Orders of Individuation: Simondon and Sri Aurobindo

Simondon identifies three such orders of individuation, the physical, the vital and the psychic. Physical individuation pertains to entities of material nature, vital individuation refers to the order of living beings and psychic individuation is of mental subjects (human beings). As discussed each of these individuations occurs at the levels of the individual and the milieu. One may bring to mind here the evolution of purusha and prakriti along the modalities of physical, vital and mental consciousness in Sri Aurobindo. The evolution of prakriti along each of these levels can be related to the individuation of the milieu, while the evolution of purusha corresponds to the individuation of the individual. One may also note that Sri Aurobindo includes the evolution of the psychic being, which expands into the triple transformation and leads to the cosmogenesis and beyond of the individual.

While Simondon's "psychic individuation" is not elaborated to this degree, it is articulated further in terms of "collective individuation" or "transindividuation," a universalized collective socius enabling an open-ended diverse individuation in individual and collective. Collective individuation, in the case of Sri Aurobindo, forms the milieu of the "divine life." Theorized by him more in terms of a universal philosophical anthropology in his philosophical and psychological texts, in his social and political texts and in practice in the habitus of his ashram in Pondicherry, the relationship between the psychic and the collective developments included a cultural dimension pertaining to global or planetary unity. In 1968, after Sri Aurobindo's passing, his spiritual partner and collaborator, Mirra Alfassa aka The Mother, founded the city of Auroville, as a "planetary city" and a "site of material and spiritual researches for a living embodiment of an actual human unity." She also coined the term "collective yoga" to refer to the relational extension of the individual yoga at the collective level, open to a planetary culture. In 1973, the year of her passing, the Mother gave a New Year message which tied the goal of psychic evolution to a collective yoga at the planetary level: "When you are conscious of the whole world at the same time, then you can become conscious of the Divine" (Alfassa, 1973, Para 1).

Transindividuation and Collective Yoga

What is meant by being conscious of the whole world at the same time? It seems to me the preparation of a psychic subjectivity identified with the subjective life of the world and its preindividual excess. How can one prepare oneself to be conscious of the whole world at the same time? For the followers of Sri Aurobindo's yoga, who have privileged his yoga texts, this might mean the expansion of individual consciousness through meditation and union with a cosmic consciousness. But those who read his social texts or who have been privy to the Mother's texts on collective yoga or her words related to Auroville may say, through the evolution of prakriti and psychic engagement with the cultural history of the world. For Simondon, this would be the preparation for the planetary transindividual:

> All individual ensembles have thus a sort of non-structured ground from which a new individuation can be produced. The psycho-social is the transindividual: it is this reality that the individuated being transports with itself, this load of being for future individuations. (Simondon, 1989/2007, p.193)

Such a preparation would bring to light the history of technology for Simondon. If the major part of Simondon's doctoral thesis at the Sorbonne was titled "Psychic and Collective Individuation," his minor paper, which got published first both in the French original and the English translation, and for which he is better known is "The Mode of Existence of Technical Objects." Following the anthropologist Leroi-Gourham, Simondon sees the human being as co-constituted by technology. Human extension into the preindividual excess and his transindividuation are facilitated by technology. But as a mode of existence, technical objects, though conceptually and functionally bound to human becoming, also represent an order of independent individuation. The evolution of lineages of technical objects, Simondon shows, follows like other forms of individuation, a transductive process leading to an efficient stabilization of elements, that has its own life outside of individual inventors, manufacturers or commercial interests. Simondon sees the individuation of technical objects following three orders related to three historical phases of human individuation—the premodern agrarian phase marked by artisanal manual tools, the modern industrial phase marked by thermodynamic engine driven machines and the postmodern and postindustrial phase marked by information processing.

If the human relationship with technology during the preindustrial phase was one which involved physical skill and implied a harmonious relationship between human, technical object and nature; the modern industrial phase has been one of increasing alienation between these three. Modern industrial machines have an enormous footprint, consume huge quantities of natural resources, disturbing the earth's ecological balance and depleting her reserves; mass produce enormous quantities of finished products, for which large industries of persuasion must be formed so as to manufacture desire for consumption; and excrete tremendous quantities of waste which must be disposed, poisoning the earth and the habitats of the underprivileged. To produce, operate and maintain these machines, human beings must subject their bodies to the movements, speeds, temperatures, pressures and other unnatural properties of large-scale thermodynamic machines and their ensembles.

Simondon sees these conditions of human-machine interaction as an unpleasant phase in their mutual transduction, resulting in the alienation that humanists have attributed to the machine. However, even in the 1960s, Simondon foresaw the overpassing of this phase and its replacement by a new postindustrial phase of information processing, where the individuation of microprocessor based information processing machines and computers would tend towards physical miniaturization and wireless communication, becoming networked ensembles that would provide universal access to all of the earth, all sources of knowledge and all material and cultural handling capacities through versatile terminals. Indeed, like McLuhan, Simondon was seeing these visions of the future in the 1960s. Freed from subjection to industrial complexes, human beings would be able to interact creatively with nature and world through a mostly invisible layer of the being of technology individuated collectively in relation with human transindividuation.

Utopia or Dystopia?

Is this the inexorable future utopia towards which global humanity is moving today with its p2p smart phones and other networked digital prosthetics and bionics? Is the experience of "being conscious of the whole world at the same time," announced by the Mother as the distant goal of an arduous spiritual development just a form of cheap purchase universally bestowed upon humanity through the transindividuation of technology? Was Heidegger's ontological subjection by the new mode of Being's disclosure through technology, seen as modernity's episteme, but a mistaken identification of a passing phase for the noons of the future?

Simondon's brilliance has been acknowledged by many major thinkers of his and our times. One of his greatest contemporaries, who reviewed his thesis with unreserved praise and borrowed heavily from him in his own work, was Gilles Deleuze; and one of the great philosophers of our times, who continues to be indebted to him and thinks using his concepts of psychic and collective individuation, is Bernard Stiegler. Writing in the 1980s, Deleuze (1992), in his *Postscript to Societies of Control*, warns about the mutations of capital from the industrial to the postindustrial age. If the ubiquitous presence of the machine extended an era of biopolitics related to the disciplining of human bodies in keeping with the needs of industry in the age of thermodynamic machines, our age of information processing sees a new kind of subjection. The miniaturization and invisibility of the machine hides its versatile and flexible control over human lives. The enhanced flexibility of work and movement, increased plethora of choices and extended reach over time and space present a commodified freedom and happiness, within which capital controls human lives, denying true creative engagement with preindividual being, which would make possible new individuations. Similarly, in our own times, Bernard Stigler has warned about real-time corporate and governmental profiling and targeting, fragmentation of subjectivity through chronic technologies of attention capture and the remaking of public memories through mnemo-technics.

What Simondon saw as the promise of a new utopian phase of human-machine transduction/transindividuation leading to an individual and collective cosmogenesis is not a given that will arise automatically through the press of new buttons. Looking at the yoga of Sri Aurobindo, the arduous subjective disciplines necessary for "the triple transformation" needs a milieu dedicated to inner development for its habitus, something less and less possible in our present age globally networked for corporate interests of production, seduction and consumption. Yet, Simondon's vision is not without its possibilities; but what it would need is the development of subjective technologies to free the consciousness of conditioning and render it creative to transindividuate using technology.

Similarly Sri Aurobindo's expansion of consciousness can perhaps be better achieved in creative engagement with a global culture made available through transduction with ubiquitous information machines. New milieus for transindividuation, new forms of McLuhan's "global village" dedicated to perpetual cosmogenetic individuation may be possible through an enhanced subjective discipline of psychic and cosmic individuation moving towards the self-making of new subjects "conscious of the whole world at the same time" in engagement with co-individuating ensembles of information networks and machines. This is the promise of the future but it needs human agency and a subjectivity that can measure itself against the objective materialization of the cosmos in the form of real-time information networks controlled by capital.

Unfolding Toward Being: Etty Hillesum and the Evolution of Consciousness

Barbara Morrill[1]

Abstract: The 'unfolding' of Etty Hillesum's developing consciousness is considered from an integral and 'evolution of consciousness' perspective. In the introductory section some parallels and similarities between aspects of transformation of consciousness and personality in integral yoga psychology and the work of A.H. Almaas and Karen Johnson, the developers of the Diamond Approach, is drawn upon to set the stage. This path combines Eastern teachings and practices with the concepts of Western depth psychology and sees development as occurring in spiraling and overlapping stages. Etty's spiritual and psychological journey is examined in the context of these stages. Her evolutionary process is informed by the Diamond Approach's method of inquiry, which is similar to Etty's process of "*hineinhorchen"* or "hearkening" to herself. This exploration will offer a contemporary yet ancient perspective that tracks Etty Hillesum's own radical evolution of consciousness that we glimpse in a mere 'moment' in time, that is, indeed, timeless.

Keywords: A.H. Almaas, Diamond Approach, Etty Hillesum, Evolution of Consciousness, Haridas Chaudhuri, Integral Yoga, Karen Johnson, Psychospiritual Transformation, Sri Aurobindo.

Introduction

I want to unfold
Let no place in me hold itself closed,
for where I am closed, I am false.
I want to stay clear in your sight.
—Rainer Maria Rilke (1996, P. 67)

The intention of this study is to locate the 'unfolding' of Etty Hillesum's—a young Jewish woman who died at Auschwitz, leaving behind a journal—developing consciousness in the field

---

[1] **Barbara Morrill**, PhD, is core faculty and Chair of the Integral Counseling Psychology Program at CIIS. She is a Clinical Psychologist licensed in CA, and has been in private practice for 20 years. Barbara has spent much of her life exploring women's social, psychological, and spiritual development, with an emphasis on intergenerational trauma. Her study of Etty Hillesum began in 2000, culminating with a presentation at the 2008 International Transpersonal Congress, New Delhi, India, entitled *Being in the Face of Annihilation: Transformation Through Writing as Inquiry in the lives of two Dutch Women During the Holocaust: Etty Hillesum (1914-1943) and Jetteke Frijda (1925-present)*.Her continued study has been about the Evolution of Consciousness as well as spiritual practice/community with The Diamond Approach with A.H. Almaas and Karen Johnson. She presented on *Unfolding Toward Being; Etty Hillesum and the Evolution of Consciousness* in January, 2014 at the Second International Congress of the Etty Hillesum Research Center at Ghent University in Belgium.

of study called the evolution of consciousness. In the introductory section, I will draw on some parallels and similarities between aspects of transformation of consciousness and personality in integral yoga and psychology and the work of A.H. Almaas to set the stage. It should be noted here that these two bodies of psychospiritual knowledge and practice have different historical roots and there are specific differences in the details of the processes of transformation between them that would warrant a separate exploration altogether. What is of relevance to this study is the key emphasis put on the role of the soul in the overall context of transformation of consciousness and personality that is not explicit in other integral models of evolution of consciousness such as those of Jean Gebser (1949/1985) and Ken Wilber (1977, 2000). I will then engage Almaas' Diamond Approach to explore in detail Etty's processes of unfoldment and transformation.

According to Haridas Chaudhuri (1965), the founder of the California Institute of Integral Studies, and student of Sri Aurobindo, the integral perspective of being consists of three factors: (1) union with the nondual ground of existence, (2) development of the deepest human potentials, and (3) participation with the evolutionary force of Being. The integral perspective involves the different levels of body, heart, mind and spirit (Sri Aurobindo, 2007, 1990), and for this paper's exploration it will be important to add the cultural and historical context as well. Etty's spiritual and psychological journey is examined in the context of these stages. Her evolutionary process is informed by the Diamond Approach's method of inquiry, which is similar to Etty's process of '*hineinhorchen*' or hearkening to herself. This exploration will offer a contemporary yet ancient perspective that tracks Etty Hillesum's own radical evolution of consciousness that we glimpse in a mere 'moment' in time, that is, indeed, timeless.

In the Diamond Approach, *essence* is central to the process of the soul's inner journey to development and liberation. From the perspective of the relationship of the soul to essential presence, the inner journey of realization can be divided into two major parts: the '*journey of ascent'* and the '*journey of descent'*. The journey of ascent has three phases: the journey to presence; the journey with presence; and the journey in or as presence (Almaas, 2002, p. 44). Almaas likens the journeys to climbing a ladder. In the journey of descent, the soul climbs back down the same ladder that it climbed on its way up to reality or true nature, but this time the soul integrates the various dimensions she has passed through in her ascent. In the ascent the soul moves inward, while in the descent is moving outward where it retains its conscious awareness within manifestation (Almaas, 2004). In this regard, The Diamond Approach is similar to processes of Psychic and Spiritual Transformation in integral yoga which comprise two aspects of the Triple Transformation process in integral yoga.

In his metaphysical magnum opus, *The Life Divine*, Sri Aurobindo (1971, pp. 889-918) discusses the Triple Transformation in the following way:

> there must first be the psychic change, the conversion of our whole present nature into a soul-instrumentation; on that or along with that there must be the spiritual change, the descent of a higher Light, Knowledge, Power, Force, Bliss, Purity into the whole being, even into the lowest recesses of the life and body, even into the darkness of our subconscience; last, there must supervene the supramental transmutation,—there must take

> place as the crowning movement the ascent into the supermind and the transforming descent of the supramental Consciousness into our entire being and nature. (p. 891)

The soul plays a central role in the transformation of consciousness in Integral yoga and psychology. Besides Atman, the transcendent aspect of the soul which is part of the eternal spirit, or Brahman, there are two more components that are key to understanding the soul in creation. One of these, *Jivatman*, is better known in the traditional Indian spiritual teachings and yoga psychology. It is the unique line of individual connection to Atman. In other words, Atman which is eternal beyond time and space, becomes individually manifested in existence as Jivatman. Another aspect of the soul is the Psychic Being which descends into the material plane and is the agency of evolution of consciousness in matter. Working behind the scenes, both Jivatman and the Psychic Being are responsible for maintaining the individual existence of the human being.

According to Neeltje Huppes (2005):

> The soul is our individual self, each soul is unique yet eternal. The psychic being is the *evolving* soul, which grows around the soul. In other words, the psychic is evolutionary, it goes through a development, it grows. This development starts from a psychic presence or a small entity. This presence is granted to all human beings, it is there in each of us. This entity can develop into an individualized Psychic Being by its action on our surface nature; changing it from ordinary nature to divine nature. Through self-observation and an aspiration for a life, first influenced, later guided by divine consciousness, a human being can enhance this process. (Para. 23)

According to Sri Aurobindo (1971):

> At the beginning the soul in Nature, the psychic entity, whose unfolding is the first step towards a spiritual change, is an entirely veiled part of us, although it is that by which we exist and persist as individual beings in Nature. The other parts of our natural composition are not only mutable but perishable; but the psychic entity in us persists and is fundamentally the same always: it contains all essential possibilities of our manifestation but is not constituted by them; it is not limited by what it manifests, not contained by the incomplete forms of the manifestation, not tarnished by the imperfections and impurities, the defects and depravations of the surface being. It is an ever-pure flame of the divinity in things and nothing that comes to it, nothing that enters into our experience can pollute its purity or extinguish the flame. (p.922)

According to the Mother:

> The soul and the Psychic Being are not exactly the same thing, although in essence they are the same. The soul is the divine spark that dwells at the center of each being; it is identical with its Divine Origin; it is the divine in human beings. The Psychic Being is formed progressively around this divine center, the soul, in the course of innumerable lives in the terrestrial evolution, until the time comes when the psychic being fully formed and wholly awakened, becomes the conscious sheath of the soul around which it is formed.

> And thus identified with the Divine, it becomes a refined instrument in the world. (Alfassa, 1972, p. 247)

The Psychic Being is also referred to as the psychic personality or evolving soul, which "passes through a slow development and formation" (Sri Aurobindo, 1971, p. 894). The soul contacts the surface personality through the mind as an intermediary, or through the heart which is in close contact with the emotional being in us.

> [I]t is consequently through the emotions that it can act best at the beginning with its native power, with its living force of concrete experience. It is through a love and adoration of the All-beautiful and All blissful, the All-Good, the True, the spiritual Reality of love, that the approach is made; the aesthetic and emotional parts join together to offer the soul, the life, the whole nature to that which they worship. (Sri Aurobindo, 1971, p. 936)

This process which is known as *psychic transformation* is described by Sri Aurobindo as cracking of the outer nature and breaking down of the walls of inner separation. The

> … inner light gets through, the inner fire burns in the heart, the substance of the nature and the stuff of consciousness refine to a greater subtlety and purity, and the deeper psychic experiences, those which are not solely of an inner mental or inner vital character, become possible in this subtler, purer, finer substance; the soul begins to unveil itself, the psychic personality reaches its full stature. (p. 907)

The process of psychic transformation is typically the first stage of the process. It is similar to Almaas' journey of ascent in the sense that our egoic consciousness reaches 'up' to soul consciousness. The three phases of ascent: the journey to presence; the journey with presence; and the journey in or as presence may be considered as phases of the process of Psychic Transformation in Integral Yoga. Here it is the soul that reaches to the surface consciousness (cracking the outer nature), in the journey to presence. The unveiling of the soul is analogous to journey with presence, and the psychic personality reaching its "full stature" constitutes journey in or as presence.

Almaas' "journey of descent" is parallel to Aurobindo's second type of transformation—the *Spiritual Transformation*. Sri Aurobindo describes this process as

> … a free inflow of all kinds of spiritual experience, experience of the Self, experience of the Ishwara and the Divine Shakti, experience of cosmic consciousness, a direct touch with cosmic forces and with the occult movements of universal Nature, a psychic sympathy and unity and inner communication and interchanges of all kinds with other beings and with Nature, illuminations of the mind by knowledge, illuminations of the heart by love and devotion and spiritual joy and ecstasy, illuminations of the sense and the body by higher experience, illuminations of dynamic action in the truth and largeness of a purified mind and heart and soul, the certitudes of the divine light and guidance, the joy and power of the divine force working in the will and the conduct. (Aurobindo, 1971, p. 908)

Integral yoga also involves another type of transformation, the Supramental Transformation, which aims at total transformation of embodied existence. Briefly, Sri Aurobindo describes this process as a highest spiritual transformation

> … that must intervene on the psychic or psycho-spiritual change; the psychic movement inward to the inner being, the Self or Divinity within us, must be completed by an opening upward to a supreme spiritual status or a higher existence. This can be done by our opening into what is above us, by an ascent of consciousness into the ranges of overmind and supramental nature in which the sense of self and spirit is ever unveiled and permanent… (p. 910)

Almaas suggests that The *Personal Essence* allows us to see the meaning and the potential of a fulfilled human and personal life, a life of truth, love, dignity and harmony, which includes the usual human concerns of work, family, creativity, accomplishments and enjoyments of all kinds (Almaas, 1988). One of the few teachers who has seen this possibility and given it its due importance is Sri Aurobindo, who was not satisfied with the transcendent and impersonal states of enlightenment alone, and who worked towards the actualization of a liberated human life. Writing about Sri Aurobindo and his work, one of his students says:

> It is not enough for us to find our individual centre without the totality of the world, or the totality of the world without the individual, and yet less to find the supreme Peace if it dissolves the world and the individual—"I do not want to be sugar," exclaimed the great Ramakrishna, "I want to eat sugar!" And without the individual what meaning would all the marvelous realizations have for us, for we are no longer them. (Satprem, 2008, p.177)

What we know from the lived experience of Etty Hillesum and other human lives born into times of significant trauma, hatred, and destruction, is that living one’s truth and liberation of consciousness is possible for some. The Mother would concur that ‘waking up’ is the purpose of our evolving soul’s journey. She says:

> But generally, having come to this stage, it remembers all that has happened to it and understands the great necessity of coming to the help of those who are yet struggling in the midst of difficulties. These psychic beings give their whole existence to the Divine Work. (Sri Aurobindo and The Mother, 1989, p. 83)

As we will see in the pages ahead, Etty Hillesum would give her entire existence, and leave us her words for our development and evolution.

Etty Hillesum: A Brief History of Her Life

Etty Hillesum, a young Jewish Dutch woman, found an inner path to liberation and union with the ‘nondual ground of existence’ in the face of the annihilation of the Holocaust. Etty was born on September 15, 1914 in Middleburg, the Netherlands, with her family moving several times, finally ending up in Deventer. Her father, a Dutch Jew, taught classical languages and was a scholarly, quiet man with a sense of humor. Etty’s mother was a Russian Jew who had escaped to the Netherlands following a pogrom and is described as passionate, chaotic and domineering.

This marriage of opposites created a tempestuous relationship and household, and Etty admired her father and was critical of her mother. Her two younger brothers were intellectually gifted, one a musician, the other a physician, and though did have severe psychological difficulties, and were hospitalized at different times for schizophrenia (Hillesum, 2002, p. xi).

Etty went to Amsterdam in 1932 to study law at the University of Amsterdam, and then went on to study Slavic languages, psychology, and Russian language and literature. She had a number of private pupils for Russian language lessons. During her university years she was involved in left-wing, antifascist student circles. In 1937 Etty moved into the household of Hans Wegerif, an accountant, as his housekeeper. After some time Etty developed an intimate relationship with Hans, and seemed to derive some sense of warmth and stability from that relationship. There were several members of the household that made up this 'family of five', including Maria Tuinzing, a nurse who became one of Etty's best friends (Hillesum, 1996, p. xvii).

Etty met Julius Spier, a chirologist and former student of Jung, in February 1941, and immediately became his student and soon after, his secretary. Spier was a psychologically gifted and charismatic figure that gathered around him a group of students, mostly women, whom he lectured to and had individual psychotherapy sessions with. His psychological approach would be considered unorthodox today, as it often included wrestling bouts, and multi-role relationships. Etty became part of this group, or 'Spier Club', and as she wrote about Spier, "I fell under the spell of the inner freedom that seemed to emanate from him" (Hillesum, 2002, p.5). Etty's psychological and spiritual journey began to take off with Spier. She started a diary and wrote about her inner life and the life around her. Her relationship with Spier is the catalyst for her own growth, he is whom she tests and challenges herself against, and this struggle dominates her early journals. Spier and Etty resist a physical relationship for a considerable time, as Spier has a fiancée waiting for him in England, and Etty has a relationship with ‘Pa’ Han Wegerif. The relationship of Etty and Spier evolves through erotic obsession to a deeply transformative one for both.

As the Nazi reign of terror increased for the Dutch Jews, Etty's journals reflect this developing horror and her experience of it. She becomes an ‘unofficial’ member of the Jewish Council in July 1942, and soon after applies for a position to help the Jews at the Westerbork transit camp. She turned down offers to go into hiding and continued to travel to and from Amsterdam and Westerbork, becoming the 'thinking heart of Westerbork'. On 7 September 1943, Etty and her parents and brother were transported to Auschwitz. Her parents died immediately upon arriving at Auschwitz, while Etty died 30 November 1943. Before her final departure, Etty gave her diaries and a bundle of letters to her friends, in case she didn't return.

The Diamond Approach

The Diamond Approach is an original spiritual path toward self-realization. It is unique in combining Eastern spiritual concepts and practices with Western knowledge of psychological development. The teaching is a comprehensive approach toward the soul’s realization of true nature, and is based on an understanding of the evolving nature of the human being and reality. Hameed Ali (penname A.H. Almaas) developed the Diamond Approach 35 years ago, after arriving from Kuwait to California to study physics at Berkeley. As his teaching reached more and more students, it developed into the Ridhwan School, with two main Centers in the United States, one in California and one in Colorado. Presently there are branches throughout the United States and Europe, including Etty's home of Amsterdam. Almaas credits his studies of Sufism, Buddhism, Aurobindo's Integral Yoga, Tantra, Kashmir Shaivism, and Gurdjieff as important influences.

Karen Johnson has participated in the development of the Diamond Approach with Hameed Ali since the 1970's. She has been teaching in the US and Europe for 35 years. She has an MA in Psychology, and trained as an artist and dancer. She has an interest in the true spirit of scientific investigation based on the love of the truth. The underlying truth that manifests through the beauty and order of the physical and spiritual universe has been a motivating force in her life.

At the core of the Diamond Approach lies the tenet that psychological growth is a necessary concomitant to spiritual evolution. In fact, one cannot evolve spiritually until one works through the psychological blocks that obscure the spiritual path. Spiritual bypassing, well known in our times, is the danger of many a path that neglects the psychological aspect of human development, including the boundless dimension. While the Diamond Approach has incorporated into its understanding the wisdom available from many branches of psychology (particularly Freudian, object relations theory and ego psychology) it is still considered a spiritual teaching and path. Where psychology typically stops, the Diamond Approach continues on to a boundless spiritual level. The primary approach to spiritual awakening and liberation is exploring and understanding immediate experience. Everyday life is the arena where this work is done; and in our relationships, work and reactions to the world around us we attempt to live a deeper, more spiritual life, but various blockages arise and we are filled with our fears, pain, and doubts instead of realizing our true nature. However, in directing our awareness and curiosity to our reactions we are lead to what our defenses were covering. As one faces into the pain and emptiness in the moment one can develop deep understanding and move naturally into a greater sense of spaciousness, presence and freedom.

This is a process that we read about innumerable times in Etty's writings that she calls "*hineinhorchen*", or "hearkening to herself". She may start with a mood, or words of Rilke, or an interaction with Spier, and in her characteristic style she seeks the truth behind the experience and dives through all the emotions and thoughts to arrive at a deeper understanding of her true nature and an ever growing freedom.

In the Diamond Approach, Being is considered the true nature of existence. It is the ground and the expression of all manifestation and is both diversity and unity. True nature is "Being without any distortion by our personal history" (Davis, 1999, P. 146). It is not a construction of ours, and when we can penetrate the subjective distortions that obscure it we are truly aware and in touch with the mystery. Being and its qualities are a natural and central part of the potential of the human being. This potential naturally opens up and develops as part of an individual's maturation. When this unfolding does not occur, psychological and epistemological blocks are often the cause. According to Almaas, these barriers consist primarily of fixed beliefs about oneself and reality in general, deeply held attitudes, inner positions, and compulsive patterns of reactivity and behavior (Almaas, 2002, pp. 10-11). With touching sensitivity, Davis concludes his description of true nature:

> True nature gives a texture to our experiences. The more we are in touch with it the more we find our experiences to be flowing, beautiful, full, clear, and pure. There is a sense of mystery. We become aware of the world, and our awareness is luminous, radiant, and delicate. We feel that everything is majestic and real. When we move deeply enough into any experience, it reveals its deepest characteristic and its true nature. True nature is not a state of consciousness; it is the ground of all consciousness. (Davis, 1999, p. 147)

The Diamond Approach considers the soul as individual consciousness and the portal to experience. The soul is fluid and dynamic and is influenced by the ego and personality as well as its true nature. The soul is not only awareness but also the locus of our awareness and the experience of our self. It is the perceiver and the perceived, the observer, the doer and the site of all experiences. In short, when we say ‘inner experience’ we are talking about the soul. The evolvement of individual consciousness is focused on the soul and its development, maturation, and refinement. As it develops, it reveals increasingly deeper levels, each disclosing true nature and the ultimate ground of all Being.

The true nature of the person or their soul is called their essence. Essence is our nature unconditioned by ego or personality. Being is the essence or true nature of the soul, as it is in all manifestation. Essence is the specific experience of Being in its various aspects when it arises as the true nature of the human soul (Almaas, 2002, p. 8). We experience ourselves as essence if we experience ourselves as free, unfabricated, and spontaneously arising—not conditioned by the past or by mental images or self-concepts. It is the truth of our very presence. Different spiritual traditions give it different names: Judaism, Christianity, and Islam: Spirit; Buddhism: Buddha Nature; Taoism : the Tao, Hinduism: Atman/Brahman. In sum, realization of essence is often considered to be the most authentic, innate and fundamental nature of who we are. The work of the soul is to open up to presence and let go of the conditioning and obstructions and blocks that prevent the soul from experiencing Essence (Davis, 1999, p. 11).

In a certain way, the spiritual journey, or the realization of Being is a process of recognition. Etty’s evolving consciousness toward Being over such a brief two and a half year period exquisitely demonstrates this growing recognition. How did such a profound shift occur in her over a relatively brief period of time? Was it Etty's experience with Spier and his teaching, or did the tragic circumstances of the Holocaust accelerate her spiritual process? Both seem important catalysts, yet these two factors needed the fertile ground of her ‘Love of the Truth’. In the Diamond Approach this love of the truth, or the recognition of the flame of the truth, no matter where it leads, or what pain one feels in the discovery, it is the fuel that propels one down the spiritual path, and throughout Etty's writings we can see her relentless search for and love of the truth. She was not to be deterred. Almaas speaks of the potential pain of the journey:

> When you really get into seeing things about yourself, it’s very painful. You don’t like it, but something in you says “I want to feel this and get to the bottom of it.” nobody’s making you do it.” So in that moment what is compelling you? It is somehow your desire to see the truth. Seeing the truth seems to be fulfilling in itself, it seems to bring some

> subtle pleasure and joy. So you want to see it regardless of how difficult it is. It is no longer a question of what is a true statement or perception or not. There is something more, and something more subtle. It is, in a sense, that the truth wants itself. And that's what is called the love of the truth for its own sake. In that situation, it is such a deep compelling desire that when it is there, nothing can stand in its way—not fear, not pain. (Almaas, 2000, pp. 96-97)
>
> The Sufi's often quote the hadith (Quran) in which God says "I was a hidden treasure: I loved to be known, so I created all." God wants to know his nature, his possibilities, his manifestations. This love to know himself, the desire to know himself, appears in us as the love to inquire; for inquiry is not only openness to what perception presents, but a love of finding out what's really there. If you say, "I'm open to what's there," you're not dynamic yet. It is the love that brings in the dynamism: "Yes, I'm not only open to seeing, I'm going to get engaged in this. I'm going to jump into the middle of the experience with my hands and feet and dig, because I love to find out." We do not need to take the Sufis literally; that is we do not need to believe in a god that loves and wants. When we clearly see true nature, we see its dynamic force as a love that manifests; everything arises out of love and celebration. (Almaas, 2002, p. 18)

The Method of Inquiry

The primary method of the Diamond Approach is inquiry. This work is an open ended inquiry into the various elements of our experience and its patterns. The understanding that what the Diamond work cultivates is not intellectual or mental comprehension but a direct awareness and experience of oneself that is present, insightful, and clear. As Almaas says, " it is the clear discrimination of the truth of experience as an inseparable aspect of that experience. This understanding is the direct response of Being to sincere inquiry." (Almaas, 2002, pp.13-14)

Generally, inquiry means a questioning or investigation, a wanting to find out, and is an element of a number of teachings, not just the Diamond Approach. India's Ramana Maharshi and the esoteric Armenian teacher George Gurdjieff are both examples of well-known teachers who employed such a method. Inquiry is also the starting point of the scientific method, and this introspection into one's experience begins the process of empirical inquiry. At its heart, inquiry is an unknowing, one that often ignites a passion to discover, to learn, to understand.

As Almaas says:

> It is as if something is tickling you from inside, saying, 'Look here, there is something here.' The flavor of unknowing…is how the unfoldment is arising. Something is coming up. Being is heaving up, presenting one of its possibilities, and that possibility is approaching your knowing consciousness. (Almaas, 2002, p.15)

Open inquiry begins by looking at our present experiences but it is a looking that must embody openness. Instead of taking our perceived discrimination as final, inquiry says "I know what I see, but I acknowledge that I do not know whether what I see is all." According to Almaas, "you cannot begin to inquire into a perception if you think you know all there is to know about it. The moment you think you know, the door to inquiry closes." (Almaas, 2002, p.17). So inquiry begins with a not-knowing, from recognizing and observing something in yourself that you do not understand.

It is well known to the EHOC (Etty Hillesum Research Centre) community that Etty was continually asking questions of herself, others and 'God'. Rainer Marie Rilke, one of her main influences, employed inquiry as a guiding philosophy. Etty responded to questions of her own and those of Spier and others with a kind of immediacy that exemplifies this "direct response of Being." The immediacy and openness in Etty Hillesum's writing is characteristic of the presence of essence. It is an openness that she had to see things as they were as well as an openness for them to change, and for the change to reveal more of what was present. Etty's open attitude of inquiry was the means of engaging not only the dynamism of Being, but the spaciousness or vastness that was the infinite possibility of her true nature.

The Diamond Work's Basic Structure: The Journey of Ascent and Descent

In the Diamond Approach, essence is central to the process of the soul's inner journey to liberation and development. From the perspective of the relationship of the soul to essential presence, the inner journey of realization can be divided into two major parts: the journey of ascent and the journey of descent. The journey of ascent has three phases: the journey to presence; the journey with presence; and the journey in or as presence (Almaas, 2002, p. 44). Almaas likens the journeys to climbing a ladder. In the journey of descent, the soul climbs back down the same ladder that it climbed on its way up to reality or true nature, but this time the soul integrates the various dimensions she has passed through in her ascent. In the ascent the soul moves inward, while in the descent is moving outward where it retains its conscious awareness within manifestation (Almaas, 2004).

The First Journey of Ascent

The first journey takes us to the beginning of experiencing our Being, as we have glimpses of our true essential presence. The recognition of essence as presence is the fundamental insight of the first journey. In this place the soul is dissociated from her true nature and living as the animal soul with the possibility of actualizing to being a human soul, a soul with heart. In the first phase we are earthbound and caught in inertia, and this has often been described as being asleep to existence. In this phase we are held captive by our conditioning to repeat the same unchanging patterns, with the same experiences, perceptions and knowledge. The same suffering and pain are re-experienced and often reinforced with addictive behaviors used to help numb us to the feelings, and Freud's repetition compulsion is often in play.

The first phase of the Diamond work is to focus its teachings and experiential exercises on the essential aspects of our humanness. Almaas suggests that "this wish to be ourselves is the true motivation for inquiry" (Almaas, 2002, p. 252). In accordance with the Sufi tradition, he calls these first five of the essential aspects the *lataif*, and each one is associated with a color. They are Joy, or the excitement of curiosity (yellow); Strength, or the capacity to engage in one's spiritual work (red); Will, the perseverance in the face of suffering, (white); Peace, or the ability to perceive what one is experiencing (black) and Compassion, or the sensitivity to hold oneself gently (green). These aspects emerge in relationship to various basic needs that are touched in the beginning stages of one’s inquiry practice. The other six essential aspects, according to the Diamond Approach, are more implicit but are important in forming the ground for inquiry: Knowing, Truth, Clarity, Focus, Personalness, and Intelligence. A.H. Almaas points out that the similarities to the Sufi understanding are limited, as the Sufi tradition is ancient and has its own system and teachings, and the Diamond Approach has come to manifest in the current age (Almaas, 2002, p. 253).

In this early phase our personality, typical patterns and feelings, and the conventional conditions of existence dominate, whether neurotic or normal. Even though one is stuck in the repetition of these patterns and conditions, this phase holds the potential to break the grip of conventional experience, exposing its limitations and opening one to the experience of true presence. An example of this process would be the opening to the presence of self-compassion that allows one to tolerate pain, and to explore and understand its origins, thus eventually reducing the pain and touching a greater presence and awareness of one's essence. At this point in the journey is where many in Western culture (based on privilege, education, and awareness) enter psychotherapy.

The Second Journey

The second journey, with presence, begins when one begins to recognize the presence of essence, the dimension of essential manifestation. Upon experiencing presence, one discovers the medium of the soul and the essence of what humanness is. It is here that an individual may have his or her first glimpses of strength without identification, solidity without the usual self representations. A spiritual teacher (rabbi, priest, guru, clergy, imam, spiritual guide, depth therapist) is often sought at this juncture to help one pay attention and discriminate the subtle and previously unrecognized aspects of experience that open the door to essential perception. The openness of Being transforms time and space. The soul’s journey here is in company with presence, both receptive to it and guided by it.

The 'Pearl Beyond Price': Individuation based on true Personal Essence

Through the development of the ego the sense of self is maintained by the ego's attachment, object relations, conditioning and history. As the second journey unfolds and these attachments and conditionings are transcended and recognized as limiting for the soul, the building of a new structure needs to occur that provides a sense of self based on essence. This phase of the second journey is toward individuation and the realization of personal essence. This is what Almaas calls ‘the pearl beyond price’. The ‘pearl’ functions as the essential structure that the soul develops and uses to integrate all her experiences of everyday life. This structure draws upon essence to mature and develop the soul's virtues, capacities, and faculties (Almaas, 2004). This personal essence, or 'pearl' gives the soul a sense of individuality and ability to function as a person in a fluid and dynamic fashion that is responsive to the environment. Throughout Journey two, the soul learns to depend less and less on the rigid ego structures for a self sense and functioning. One can be in the world coming from an authentic place, as the pearl has the qualities of autonomy, beingness, independence, yet contact with the world and others. In developing the pearl we realize that who we really are is our essence, and not our attachments. As Almaas writes, having the pearl and touching true personal essence is "the experience of being oneself and not a response or reaction to something. It is not being something for somebody. It is, in a sense, complete freedom, the freedom to be" (Davis, 1999, p. 123). Almaas describes the Pearl as an "ontological presence", as opposed to the structured process of the ego. But the Pearl is personal, and not impersonal and detached. It has the capacity to make intimate contact with another human being and still be totally free and unconditioned. In fact, because of its freedom and basis in personal essence and true nature, the pearl is capable of more intimacy and connectedness than the selfish ego. As the second journey and self-realization continues the pearl becomes more deeply integrated with other aspects of one's personal essence, and then finally with the boundless dimensions.

The Discovery of Essence

As the development of the pearl is the process of individuation in the second journey, there is a second phase occurring in the second journey that involves the soul's maturation and the realization of true nature and essential identity. During this phase of the journey the soul experiences essence mainly as an internal phenomena that inspires, guides and supports the soul. This is still a dual experience as she recognizes essence as her nature and is with it but not identical to it. This experience exposes the ego as the primary barrier to identity with essence, as the soul is only beginning to construct the 'pearl' and is still more or less dependent on the ego for self-identity. Through the process of uncovering and working through the ego structures, the soul learns about the inherent narcissism of the ego. The Diamond Approach has come to name this process 'the point work' (Almaas, 1996). The transcendence of this narcissism is self-realization, or the soul’s realization.

The Point Work

In the natural course of human development the infant initially is present to his or her immediate experience and true nature. As the self develops, the infant acquires memories and starts to lose this immediacy and begins to experience oneself through past impressions and the developing ego structures. Consequently, the soul loses awareness of its wholeness or true nature. Narcissism is the consequence of this loss of immediacy and lack of presence to one's wholeness. Narcissism manifests itself with self-centeredness, sensitivity to others’ critiques, easily wounded by others’ lack of empathy, defensiveness about one's mistakes or weaknesses and a need to be seen, admired and appreciated. All these narcissistic defenses cover a pervasive sense of being deficient and worthless, and a deep narcissistic wound caused by the alienation from one's essential presence. The development of the narcissistic wound was fostered by the significant people surrounding the child that didn't see or support the child's true self. This lack of support and love was intolerable to the child and consequently a limited false self was developed that was more acceptable. A sense of betrayal remains due to this lack of support, and not only toward others but also toward oneself for giving up the wholeness of Being. In the journey to self-realization this construction of a limited self needs to be torn down and the wholeness of one's Being laid bare.

The point work involves using inquiry to uncover and work through these narcissistic defenses to open the narcissistic wound and find one's true nature. During this process various emotions arise. First, comes dread as one approaches the great emptiness, and then shame and embarrassment related to one's sense of deficiency. Due to the betrayal, narcissistic rage can erupt both at ourselves and at the critical and rejecting others. These emotions are difficult to experience and the tendency of the ego is to turn away and cover up. In the point work one counters the ego and continues to face the pain and sense of worthlessness, using inquiry as a tool of discovery. This process takes a great love for the truth to bear the pain.

The uncovering leads to a dissolving of the sense of self and the experience of great emptiness. Sometimes the ego fills this emptiness with a narcissistic depression and hopelessness as a defense against the perceived loss of self. The way out of being stuck in this emptiness and depression requires a basic trust in the goodness of the nature of the universe. Inquiry into one's distrust ultimately can lead to a discovering of trust. Accompanying this discovery is accepting and surrendering to not knowing what to do, "for being is not a matter of doing anything" (Almaas, 1996, p. 342). Finding this trust in the rightness of the cosmos, and beauty, leads to compassion and loving kindness toward the self, and to the experience of universal love. Being present to this universal love transforms the emptiness into a luminous vastness that is peaceful and free of the constrictions of the self. The experience of this love allows the ego to stop its incessant, self-preserving activity, and let Being just occur. Empathic guidance from a teacher can be very important during the point work to help support the student in facing this painful material, and to model universal love.

Summary

The realization of personal essence and essential identity are two interdependent processes that have separate stages and different elements. Perhaps the most significant difference is that the realization of the personal essence is more of a development and construction, while the realization of essential identity is a discovery. The development of 'the pearl beyond price' enables the soul to mature and individuate, while the realization of essential identity involves the penetration of the false self and the discovery of one's true nature. Both the individuation process and realization of true nature are focused on dissolving the ego and its limiting narcissism, and at the end of journey two the soul begins to know her essence as her identity. The duality of soul and essence begins to be bridged and the soul moves into the third journey. "The soul recognizes she is the simplicity and exquisiteness of timeless presence." (Almaas, 2004, p. 224)

The Third Journey

This journey is entitled the journey in or as presence. It involves the development of and living through non-duality. The soul's experience becomes one with essential presence, and all the maturation and structures of the soul that were developed in the second journey now become integrated into this non-dual presence. This journey, like the second journey, has two interdependent or complementary phases.

The first phase is the essential development of the soul, what the Diamond Work calls the “essentialization” of the soul. It is the complete merging of the soul with essence, where the transparency of the soul to essence becomes so complete that the two become one. This non-dual soul is a dynamic presence that all experience arises from. When the soul is realized, she is totally inseparable from and transparent to the presence of love. She is not only love, says Almaas, but “she is loving in a complete and full way. She is a presence that expresses itself dynamically as loving action. The dynamism and the presence of love are inseparable, co-emergent” (Almaas, 2004, p. 225). This essentialization of the soul can include all aspects, such as intelligence, compassion, clarity, steadfastness, etc. It can be in the physical, expressive or mental realm. In this transformation, the soul has progressed from the stage of the human soul, the attainment of the second journey, to the stage of realized or essential soul.

The second phase of the development of nonduality is the discovery in presence of the boundlessness of true nature. True nature begins to reveal it is the ground and nature of everything, and that it transcends the limited boundaries of individuality or personhood of the soul. The soul now begins to experience herself "as a boundless and nonlocal presence that transcends all spatial extensions, as eternal ‘nowness’ that transcends all time, and as a mystery that transcends all determinations. She is all and everything, she is Reality" (Almaas, 2004, p. 225). In the third journey, one experiences true nature free from the limitations of separateness, and from particular forms and manifestations. As presence or human consciousness has gone beyond the individual soul and personal essence to touch boundless Reality, nonduality is now complete.

Journey of Descent

Now that the soul has journeyed into the mystery and transcended all limitations, it flows back into the multitude of forms and objects of the phenomenal world. As the soul does so, it maintains its connection to the absolute and true nature that it has discovered, but integrates Being into the manifestations of the phenomenal world. The journey of ascent was a movement inward, while the journey of descent is a movement outward into the world of forms and objects, which leads to integration and union with the whole (Almaas, 2004). This journey involves understanding the absolute not only as a transcendent truth but also as the immanent ground of Reality. Like the previous two journeys, this journey involves the two phases of self-realization and individuation. There develops a deeper understanding of the functional relationship between true nature and the individual soul, and the relationship between soul, Being or God, and the cosmos. In the descent the soul finds its place in the cosmic reality.

The journeys of ascent and descent are not separate linear processes, but are present simultaneously, co-existing and co-emerging. The journeys complement each other and are equally important. "Immanence, fullness, and the myriad forms of the world are one side of a coin; transcendence, emptiness, and the mystery of union are the other. Thus, the richness and beauty of the world are no more true, valuable or privileged than its emptiness, spaciousness and vastness"(Davis, 1999, p. 153).

Journey 1: Etty Hillesum

Since we have only two and a half years of Etty’s words and experiences describing these four phases of the journey to the realization of true nature, the stages are compressed and overlap greatly, and are often not as distinct and differentiated as I am pointing out here. Most authors of Hillesum, however, recognize the gradual, yet dramatic change in the tonality of Etty’s personality and life as she moves toward the unfolding of her Being. I appreciate the interwoveness and gradual shift in Etty's unfolding, even as I unpack the journeys to illuminate her process of evolution.

As mentioned, in the first journey we get glimpses of Being itself, the first recognition of our essence as presence. However, the soul is cutoff from her true nature in this stage. Earthbound, caught in survival and self-absorption, asleep to existence, we repeat the same patterns of perception and behavior that we have developed through our conditioning. Even though one is stuck in the repetition, the potential exists in this journey to break through conventional experience and reveal its limitations, opening one to true presence.

This is a phase where dynamics of family relationships come into full awareness. While little is known of Etty’s childhood years, it is clear in her teenage and younger adult years she struggled intensely in relationship to her mother, while idealizing her father. She deemed her mother to be chaotic and smothering, and her father as accomplished, stoic, and erudite. These parental relationships do much to set the stage for the negating of her own personality and the tendency to merge with older men for security, love and learning. She shares the Russian sense of drama, emotionality and somatic complaints of her mother, yet identifies with the intellectual curiosity and capacity of her father.

Etty captures moments of insight and vulnerability without, seemingly, a staged self representation. Her budding transparency suggests an inner strength with striking immediacy. What is illuminating at this first stage is that her expanded self has compassion for this egoic, scattered, and immature personality. For example:

> Here in this strange family, there is such a remarkable mixture of barbarism and culture that you are stripped of all your strength…In the past, my picturesque family would cost me a bucket of tears every night. I can’t explain those tears as of yet; they came from somewhere in the dark collective unconscious. Nowadays I am not so wasteful of this precious fluid, but it is not easy to live here. (Hillesum, 2002, p. 83)

And again:

> Mother’s first words to me were, “I really do feel awful.” It’s so strange. Father has only to utter the smallest sigh and my heart just about breaks, but when Mother says with great pathos, I really do feel awful, I couldn’t sleep a wink again”, and so on, I remain basically untouched...
>
> Stop whining, for goodness sake, you shrew, you nag, carrying on like that. Such are my inner reactions when my mother sits down to have a chat with me. My mother is someone

> who would try the patience of a saint. I do my best to look at her objectively, and I try to be fond of her, but then suddenly I'll find myself saying, emphatically, "What a ridiculous and silly person you are." It's so wrong of me….
>
> And again: Had a respectable conversation in Russian with Mother, who suddenly seems a spirited, decent person again. Then I am all at once dreadfully sorry for having had such ugly feelings and am sure that I have misjudged her, but a few hours later an exasperated little devil inside me suddenly riles against her again: You horrible cry-baby, stop all that rubbish, you're honestly quite mad, what a mad person you are." I think these thoughts very soberly and with a wry sort of humor, and love is far removed from me then. Etty, Etty, don't let yourself down like that! And isn't it high time you were asleep? (Hillesum, 2002, pp. 81-83)

As the entries indicate there is a forming of a relationship with herself that is reminiscent of a 're -parenting' of herself, opening to self compassion right along with her overwhelm, anger, guilt and regret.

In the first phases of spiritual or therapeutic work the use of a journal is common, as is the seeking of a teacher. It seems Etty was ripe for both as she went to one of Julius Spier 's lectures, and asked to become his student. In a short time she became his secretary and assistant. We realize how much Etty is a natural seeker, and has begun a journey with a teacher, both psychologically and spiritually. Spier, known as S. in Etty's journal, was a chirologist and psychologist associated with C.G. Jung. What she saw in Spier went beyond his obvious personality conflicts and limitations. She wanted what he had: his spiritual presence, his deep wisdom and love of the truth and of the students he worked with, and his ability to see through things as they really were. He helped Etty to face reality, to be with whatever came up in her and allow it, and to inquire into it, just as Diamond Approach students would do. Spier and his 'magical personality' could be seen today from an Integral, eastern perspective as a guru, or a teacher of an older philosophical tradition, such as the perennial philosophy, including the ancient spiritual traditions of the east such as Buddhism, Sufism, Hinduism, as well as indigenous traditions, and mystical branches of Judaism, Christianity and Islam. Spier's group of students could be like any "mystery" school, *sangha*, or spiritual community of any kind such as the Diamond Approach, called the Ridhwan school, with its teachings, transmission, and practices of dyadic inquiry, chanting, meditation and study.

We get a glimpse of what Etty was experiencing at the time of her choosing a teacher from this entry:

> …Intelligent, incredibly wise, age-old gray eyes, which drew one's attention from the full mouth, but not for long or all together. I was awed by his skill, his ability to read my deepest conflicts from my second face: my hands…. And then there was his lecture. The impression was good. First rate lecture. A charming man. Charming smile, despite the false teeth. I fell under the spell of the inner freedom that seemed to emanate from him… (Hillesum, 2002, pp. 4-5)

It is here, in Etty's first letter to Spier, where we understand what she is addressing in her work with him, the base of the first journey. This entry, the first one in Exercise Book 1 is prescient of what is to come:

> You know, yesterday, when I could do nothing but look stupidly at you, I experienced such a clash of conflicting thoughts and feelings that I was quite shattered and would have yelled out loud had I had even less self-control. I experienced strong erotic feelings for you, which I thought I would have got over by now, and at the same time a strong aversion to you, and there was also a sudden feeling of utter loneliness, a suspicion that life is terribly difficult, that one has to face it all on one's own, that help from outside is out of the question and uncertainty, fear and all of that too. A small slice of chaos was suddenly staring at me from deep down inside my soul. And when I had left you and was going back home, I wanted a car to run me over and thought, ah, well, I must be out of my mind, like the rest of my family, something I always think when I feel the slightest bit desperate. But I know again that I am not mad, I simply need to do a lot of work on myself before I develop into an adult and a complete human being. And you will be helping me won't you?
>
> Well, I have written you a few lines now; they have cost me a lot of trouble. I write with the greatest reluctance, and always feel inhibited and uncertain when I do. Yet, I want to become a writer one day, would you believe it? (Hillesum, 2002, p. 3)

As mentioned, right away, Etty, unabashedly shares her erotic attraction and aversion to Spier, leading us to two of the most powerful energies for transformation: desire and repulsion. Initially, Etty prides herself on her skill and passion as a lover. As she says, "I am accomplished in bed, just about seasoned enough I should think, to be counted among the better lovers," yet her deepest commitment is revealed in the continuance of the same sentence: "and love does indeed suit me to perfection, and yet it remains a mere trifle, set apart from what is truly essential, and deep inside me something is still locked away." (Hillesum, 2002, p. 4E)

This tension will become a dynamic part of the second phase of her Journey, but for this first phase of her exploring, her 'gender questions', much like the younger Anne Frank, are very much on her mind and heart:

> He said that love of mankind (sic) is greater than the love of one man. For when you love one person you are merely loving oneself. He is a mature fifty-five year old man and has reached the stage where he can love all mankind, having loved many individuals in the past. I am an ordinary twenty-seven year old girl, and I too am filled with love for all mankind but for all I know I shall always continue to be in search of my one man. And I wonder to what extent that is a handicap, a woman's handicap. Whether it is an ancient tradition from which she must liberate herself, or whether it is so much part of her very essence that she would be doing violence to herself if she bestowed her love on all mankind instead of one single man. …. Feelings of friendship, respect, and love for us as human beings, these are all very well, but don't we ultimately want men to desire us as women? ….Perhaps the true, essential emancipation of women still has to come. We are not yet full human beings; we are "the weaker sex." We are still tied down and enmeshed

> in centuries-old traditions. We still have to be born as human beings; that is the great task that lies before us. (Hillesum, 2002, p. 69)

Another area Etty speaks about in the early phase of her journey is loneliness, indicative of depression, mania or anxiety. I would call it existential despair in its tone as well as a kind of cyclothymia in its biological characteristics. She says:

> I know two sorts of loneliness. One makes me feel dreadfully unhappy, lost and forlorn, the other makes me feel strong and happy. The first always appears when I feel out of touch with my fellow men (sic), with everything, when I am completely cut off from others and from myself and can see no purpose in life or any connection between things, nor have the slightest idea where I fit in. With the other kind of loneliness, by contrast, I feel very strong and certain and connected with everyone and everything and God. (Hillesum, 2002, p. 82)

In these states of disconnection, the theme of Etty's personality struggle is one of feeling lost. So, when she says "I need to expose myself unreservedly to someone. And perhaps and above all I also want that someone to appreciate my full worth." We can see why Spier and his psychological and spiritual mastery become so important to her, even if his carnal struggle was in "full cry." Etty is becoming aware of herself and what she needs and wants in relationship. She is committed to record everything that is going on with her and realizes she can't capture all of it in words at this stage. Her agitation gets translated into the somatic complaints of headaches, stomachaches, or digestion problems. She has used metaphors of a "tightly bound ball of twine" the "cork that bottles her up again" to explain this inability to write or, "to say things, to express them in such a way that the words become transparent and the spirit behind them can be seen." It is very telling when Etty is in one of these cut off and alienated places, and when she hears from S. she comes back to center: "I regained contact with myself, with the deepest and best in me which I call God, and so also with you. A moment came in which I grew one stage further, in which many new perspectives about myself and my bond with you and my fellow beings appeared" (Hillesum, 2002, p. 83).

There are many points in this first journey where Etty's maturation becomes palpable:

> A strong straight pillar is growing in my heart, I can almost feel it growing, and around it all the rest resolves; I myself, the world, everything. And the pillar is an earnest (symbol) of my inner security. How terribly important this is for me, being in touch with my inner self! I don't go on losing my balance or tumbling from one world into the next…Something is being consolidated within me, I seem to be taking root instead of continuously drifting, but it is still no more than the fragile start of a new and more mature phase. You must keep watching your step, little one, but I am well pleased with you all the same, your pulling through, truly, you are pulling through…" (Hillesum, 2002, p. 85)

Etty often mentions she wants to be a chronicler; one who sees, writes, records, helping others to see, to understand, to expand. This is her mission. She elaborates and underscores her curiosity, so familiar to the logos of the Diamond Approach as the fuel of the spiritual journey:

> I want to live to see the future, to become the chronicler of the things that are happening now (downstairs they are screaming blue murder with father yelling, "Go then!" and slamming the door; that too, must be absorbed, and now I am suddenly crying since I am not all that objective really and no one can breathe properly in this house; all right, make the best of it then); oh yes, a chronicler. I notice that over and above all my subjective suffering, I have an irrepressible objective curiosity, a passionate interest in everything that touches this world and its people and my own motives. Sometimes I believe that I have a task. Everything that opens around me is to be clarified in my mind and later in my writing. Poor head and poor heart, what a lot there is still in store for you. Rich head and rich heart, you still have a lovely life, though, both of you. I have stopped crying. But my head still throbs. It is sheer hell in this house. I would have to be quite a writer to describe it properly. Anyhow, I sprang from this chaos, and it is my business to pull myself out of it. S. calls it "building with noble material; he's a real treasure."

As discussed, the method of the Diamond Approach is inquiry. To merely ask questions does not include the complexity and depth of the process; it actually has a great deal to do with being present to what arises throughout the process of inquiring, very similar to Etty's process of "hineinhorchen" or "hearkening" to herself. Rilke was also a guide for her in this regard and she gave credit to Rilke and Spier for teaching her about the wisdom of suffering in the moment, not the idea of suffering. She describes the process of "hearkening" as:

> Hearkening to myself, to others, to the world. I listen very intently, with my whole being, and try to fathom the meaning of things. I am always very tense and attentive. I keep looking for something but I don't know what. What I am looking for, of course, is my own truth, but I still have no idea of what it will look like. (Hillesum, 2002, pp. 90-91)

These are actually three important parts of the Diamond work; hearkening or inquiring into experience, the love of the truth, and holding the reality of 'not knowing'.

What becomes clear at the base of this split she feels within herself is a feeling of shame. Her struggle with her body and her view of the feminine instilled in her by nature and nurture and seems deficient to what she sees in the masculine. She reveals the difficulty she faces in realizing how all her physical symptoms, including strong fatigue and shifting moods, keep her off balance and stuck. She is embarrassed and tells us so:

> I always think it is so humiliating that the mind should be impaired by a silly cold or by headaches or by whatever other physical complaints. I always feel ashamed about being unwell, I want to keep it to myself, struggle against it and, as a result, I feel twice as bad, a person without energy because the body has such a tremendous influence on one's work and, more generally, on one's whole psychological state. Do I still tend to despise the body? Does one have to stand by one's illnesses, even the most minor, or should one resist them? This is still something of a problem for the girl who broods too much. (Hillesum, 2002, p. 91)

The final thing I would like to discuss in the first phase of Etty's journey based upon these journals is the beginning of a conscious relationship with what she is calling God. She says early on that God is what is the 'deepest and best' in her. She says that:

> There is a really deep well inside me. And in it dwells God. Sometimes I am there, too. But more often stones and grit block the well, and God is buried beneath. Then he must be dug out again. (Hillesum, 2002, 91)

What becomes apparent is that Etty's religiosity is radically unconventional. In Holland today, says J.G. Gaarlandt (Hillesum, 1996, p. xv) Christians and Jews are claiming Etty as typically Jewish or typically Christian – "an unprofitable discussion as Etty chooses her own way." It seems to me that Etty chooses a way, an integral way, all inclusive of the world's deepest mystical traditions or the perennial wisdom of transformation. It seems that Etty's first attempts at being present, or praying, or meditation have something to do with surrender, as kneeling becomes a way and symbol of that surrender. She describes one of her first times:

> This afternoon I suddenly found myself kneeling on the brown coconut matting in the bathroom, my head hidden in my dressing gown, which was slung over the broken cane chair. Kneeling down doesn't come easily to me, I feel a sort of embarrassment. Why? Probably because of the critical, rational, atheistic bit that is part of me as well. And yet every so often I have a great urge to kneel down with my face in my hands and in this way find some peace and to listen to that hidden source within me. (Hillesum, 2002, p. 103)

Gaarlandt, one of the early publishers of Etty, poses the question: "Was she a mystic?" and answers the question with "Perhaps." What strikes us as different about Etty in this regard is her 'crystal-clear honesty,' something important to psychological and spiritual systems such as the "Spier Club" or in my experience, the Diamond Approach. She insisted that "mysticism must rest on crystal-clear honesty, and can only come after things have been stripped down to their naked reality." Much like any of the non-dual, integral theorists, teachers and practitioners such as Sri Aurobindo and the Mother, Jean Gebser or, the more contemporary ones such as Ken Wilber, or A. H. Almaas and Karen Johnson, the 'work' is done in the world and not (only) in solitary contemplation. We will see in the next phases of Etty's life, the deepening, the deconstruction, and the love of truth. I agree with Gaarlandt when he says "her vision had nothing to do with escape or self-deception, and everything to do with a hard-won, steady, and whole perception of reality. Her God, in a sense, resided in her own capacity to see the truth, to bear it and find consolation in it" (Hillesum, 1996, p. xv).

Journey 2: Etty Hillesum

It's a slow and painful process, this striving after true inner freedom (Hillesum, 2002, p. 134).

As mentioned earlier, as the Diamond Approach's definition of the second journey, the personal essence or 'pearl' gives the soul a sense of fullness, individuality, and ability to function as a person in a fluid and dynamic fashion responsive to the environment. The pearl has the qualities of autonomy, beingness, and independence, yet has contact with the world and others. It is about evolving maturation, with a certain lustre and fullness that you might think of as you imagine an actual pearl.

As Etty enters this next iteration of the journey, the second one, she becomes more determined to examine and assimilate her sensual obsession with Spier. She struggles with romantic notions of the ideal relationship, her own jealousy and possessiveness, while attributing this to the “illogical” nature of women. It is as if she is unwinding, at such an early age, 'the inner ball of twine', inch by inch as she explores gender and romance through her own experience.

> Yes, we foolish, idiotic, illogical women, we all seek Paradise and the Absolute. And yet my brain, my capable brain tells me there are no absolutes, that everything is relative, endlessly diverse, and in eternal motion, and that is precisely for that reason that life is so exciting and fascinating, but also very, very painful. We women want to perpetuate ourselves in a man. Yes, I want him to say “Darling, you are the only one, and I shall love you for evermore. I know, of course, that there is no such thing as eternal love, but unless he declares it for me, nothing has any meaning. And the stupid thing is I don’t really want him forever or as the only one in my life, and yet I demand it of him. Do I demand absolute love from others because I’m unable to give it to myself? And I always expect the same level of intensity…. After all, I wouldn’t know what to do if somebody really was on fire for me all day long. It would annoy me and bore me and make me feel tied down. Oh, Etty, Etty! (Hillesum, 2002, p. 105)

These are the kind of struggles that suggest identification at the object relations level of development, where everything gets viewed from the original and primal need for love, with needs such as security, and the animal body’s physical and sexual urges as central. This stage is also rife with the deficiencies that surface based on personality fixations as well as parental deficiencies and modeling. The prevailing historical and cultural beliefs about gender add and reinforce to the conditioning. Etty reveals her wisdom when she reflects on these things and says that her need for Spier to desire 'me alone' and for ‘eternal love’ “are some kind of compulsion.” She begins to recognize this when she is feeling ‘extremely’ sensual, she obsesses about Spier, “his mouth and hands while everything else pales into insignificance…” As the above quote illustrates she is quite aware this is a compulsive fantasy.

One day later she gives us a sense of this ability to see, to assimilate, to metabolize as she says:

> This has to be put plainly now once and for all – be a bit more sparing with your “once and for alls”, my girl, there’s no such thing in life. It seems so simple now, but there will always be minor crises. What are the facts, then? This afternoon I bicycled over to see him, completely wrapped up in things to do with his work, with no womanly feeling at all. The thought suddenly struck me, and I felt more serious about it than I usually do: I really want to work with him for a few years. I am getting very attuned to him, can learn a tremendous lot from him and can also do a lot for him. I was so pleased with him and our relationship. (Hillesum, 2002, p. 107)

What is striking here is that Etty is aware of her ups and downs, her recognition that: “there will always be minor crises”, and Spier was aware of this as well, as he said to her “ Right now I happen to be the right friend for you.” While this turned out to be true in a much larger sense, the sexual forces between them would complicate their spiritual and psychological work. Etty lets us know that she ‘saw’ the whole of Spier and herself when she says, “I would like him to love me like that" (as this is how she idealized what love of a man would be for a woman), and she continues, “he is a good, dear, fascinating human being, and also volatile, temperamental and full of unexpected nonsense.”

While Etty realized at one level the dangers of being exploited by a teacher and therapist “wrestling” with his women students as an intimate practice, she would only later realize her deep vulnerability in this regard. In spite of Spier's deficiencies it was because of his influence that Etty came to see her life and strivings in non-dualistic terms, as she says “You taught me to speak the name of God without embarrassment. You were the mediator between God and me” (Hillesum, 2002, p. 516). Carol Lee Flinders captures this phase of Etty’s relationship with Spier when she says so crisply, “mediator he may have been, but in effect, Spier threw almost as many obstacles in Etty’s path as he removed. We could resent him more for this if those obstacles hadn’t also been the making of her” (Flinders, 2006, p. 44).

Etty’s relationship with Spier is what spans her second journey. This is the time that Etty’s ‘pearl’ becomes more and more evident as she actually experiences what it meant to “repose in herself.” It is, of course, paradoxical that the pearl gains its lustre during the deepest parts of one’s struggle. For Etty, it seems like it is the first conscious drive to awaken, not masked by mood swings or illness, and in fact the beginning of the way in to her origins. It begins with a true grappling with her demon of jealousy and possessiveness and surely a part of what Almaas (1996) calls the ‘point work’ referred to earlier in this paper. It is the work of facing into the deconstruction of the ego’s hold on self representation; the crumbling of the edifice and touching of the ‘abyss.’ Another way to put it in the language of the Diamond Approach is the cracking of the egoic shell and revealing not only the terror of annihilation, but the deepest human vulnerability without the layers of defense.

While beginning this section with her grappling with ideals about eternal or undying romantic love, she moves to the next layer that reveals what she thinks is another obstacle to Spier's love, his fiancé Hertha Levi. Etty‘s fear was that Hertha would come to Amsterdam to join Spier on an on-going basis.

> I suddenly had the feeling that Hertha was coming back. My heart broke…several times over. I waged a heroic struggle and then took off for faraway Russia. After first having written him a heartrending letter to tell him I was but a frail human being who could not cope with him and Hertha combined. Nor did I want to have anything more to do with his work, and I suddenly puzzled hard whether I had not chosen the work for the man’s sake rather than to the man for his work’s sake. And though I knew I would never want to marry him, I could not put up with him having another woman. (Hillesum, 2002, p. 117)

Each of these obsessive fantasies, and the subsequent inner struggles that would ensue, would bring Etty back to her goal, which was that of learning to love another person unconditionally, wholly, as a way of preparing her (and them) to love all human beings in a similar fashion, so the love for one would lead to the love of all. Spier had the same goal and also had his own way of backsliding. But this mission that they shared, had the power to transform both of them over time.

It becomes clear that Etty is maturing over time and is becoming more and more convinced that she is “no longer cut off from that deep undercurrent” within her. It is indeed painstaking work, and Etty rose to this challenge based upon her own drive for the truth. It was not evolved or so radiant to begin with, which is important for most seekers to know. It was a grind, like the grains of sand rubbing over the pearl, over and over again, to face the reality of her relationship with Spier, as if grinding the toughest kernels of corn into a soft pulp. As she says:

> He was probably tired as well, absorbed in something or other. In the past that would have been a shock, I should not have been able to take that neutral conversation. This time, too, I felt for a moment how tired and over-excited I was, because the horribly sober tone he used made me want to let myself go completely for a split second, to burst into tears or something like that. But in another split second I had scolded myself for being so hysterical. In the past I would have been quite unable to reconcile his sober tone with my feelings toward him, and there would have been a head-on-collision. I would have blown the whole thing up out of all proportion. But this morning it suddenly hit me: its ebb tide again. And now I know that the flood tide will be coming back… And now just this bit more: when it suddenly struck me, again in the bathroom, that it can’t always be flood tide in a friendship, and that the ebb tide has to be accepted as something positive and fruitful as well, then, life, too suddenly surged through me again with a calmer beat. (Hillesum, 2002, pp. 200-201)

This is the period that Etty’s desire for Spier reached its peak, as she continually mentions its deepening in the form of “intensity.” As she says, "I am afraid of the full physical relationship, lest it fail to reach the same pitch as our intellectual relationship, and something gets spoiled. One should never force things but leave them to develop naturally and wait for the ripe fruit to drop. My desire is developing very slowly and ripening into complete surrender of a kind I have never known before” (Hillesum, 2002, p. 257).

We will return to Etty’s ever growing and changing relationship with Spier, as this is the ground of this second part of her journey, just as it is the beginning of her awareness of the oppressive society of the Third Reich that was gathering around her. This is one of the first times that Etty addresses her direct experience with the Nazi machine:

> Very early on Wednesday morning a large group of us were crowded into the Gestapo hall, and at that moment the circumstances of all our lives were the same. All of us occupied the same space, the men behind the desk no less than those about to be questioned. What distinguished each one of us was only our inner attitudes…. When it was my turn to stand in front of his desk, he bawled at me. “What the hell’s so funny?” I wanted to say nothing’s funny here except you, “ but refrained. “I didn’t mean to its my usual expression.” And he, “don’t give me that, get the hell out of here,” his face saying I’ll deal with you later.” And that was presumably meant to scare me to death, but the device was

> too transparent. I am not easily frightened. Not because I am brave, but because I know that I am dealing with human beings and I must try as hard as I can to understand everything that anyone ever does. And that was the real import of this morning; not that a disgruntled young Gestapo Officer yelled at me, but that I felt no indignation, rather a real compassion, and would have liked to ask, "Did you have a very unhappy childhood, has your girlfriend let you down?" Yes, he looked harassed and driven, sullen and weak. II should have liked to start treating him there and then, for I know that pitiful young men like that are dangerous as soon as they are let loose on human kind. (Hillesum, 2002, p. 259)

This marks the very beginning of Etty's attention to the impending threat. At the moment it is held at bay, and within this second part of her journey will she come to realize how dangerous 'pitiful men like this' are 'as soon as they are let loose on human kind.'

Yet her personal essence grows as manifested through her grappling with relationship. During the first half of this stage, Etty's desire was actually to 'see through' her stuckness, her impasses, her blocks, as well as her fear, in order to become internally free. We see she has reached a turning point with Spier, just past a year into their relationship, she reveals:

> I suddenly knew for sure that I would be visiting a great many countries, see a great many people, write books, and leave him, …and how I felt freer of him at that moment than ever before, yet also closer to him. And then I said No matter what happens between us, that feeling of freedom, of being a world unto myself, of having no claims on you, will always be with me, and that is why I have the courage to tell you everything all the time, the courage even to express my desire, since that doesn't call for any ties. It is sheer desire, nothing more, and it longs for one part of you, and yet I am free of you… and I am walking this path right now—that became clear to me yesterday. I have turned my desire into our joint venture, and we shall no doubt cope with it together. (Hillesum, 2002, pp. 268-269)

Etty and Spier's joint venture became her catalyst for transformation. What started as tempering their desire for the sake of their other relationships, Pa Han Wegerif for Etty and Hertha Levi for Spier, became for both of them a path of deepening love. In many ways this would resemble Tantric philosophy of the east, which uses sexual energy to fuel spiritual evolution. Etty's struggle with possession, sexual desire, and jealousy began to expand to another dimension of love entirely. She says "That I can feel such great love! My inner state is blossoming forth in all directions, my love grows ever stronger and greater, I am learning to bear it better and better and no longer feel crushed by it" (Hillesum, 2002, p. 352).

Some of the relationships well known in the spiritual world, often beginning as teacher and student, evolved into a mutuality where the relationship became more of a mystical union, larger than and including both individuals. Jelaluddin Rumi and Shams of Tebriz, Sri Aurobindo and the Mother, and A.H. Almaas and Karen Johnson of the Diamond work all refer to the phenomena of such relationships being one consciousness in two bodies. Etty and Spier could be counted among their members. Karen Johnson and A.H. Almaas write about this divine eros in their book entitled: "The Power of Divine Eros; The Illuminating Force of Love in Everyday

Life." In it they speak about the 'two loves" of human beings; one as the love of life and personal relationships, the world and its beauty and turmoil, and the other as the love of mystery, and complete inner freedom (Almaas and Johnson, 2013, pp. 34-35). These spiritual partners mentioned above seem to embody the 'whole' in their relationships, yin and yang, receptive and dynamic, feminine and masculine, inner and outer, two as one, all as one. As Karen puts it:

> When we follow love to its source, we may feel the actual presence of love itself. Then love is no longer just an idea, a thought, or even an emotional affect. We are in touch with the underlying process of love, which has a feeling of an actual presence of light and fullness or a liquid soft presence…When we know the nature of love, we can begin to see that, in fact, our spiritual nature is what can embrace our personal relationships. (Almaas and Johnson, 2013, pp.38-40)

In a recent chapter written on the Diamond Approach in a Handbook on Transpersonal Psychology, Davis, et al (2013) write: "As the soul opens to her boundless nature, the personal essence integrates more and more dimensions of being, bringing these riches into the world through personal and human expression" (p. 571). We begin to see at this stage in Etty's unfolding that it is possible for the soul to touch the boundless dimension and simultaneously express it in her unique way, through her personal essence. Etty gives us a glimpse of the continual freshness arising at the same time in this relationship:

> It is as if I had never seen him before, as if I were having to get to know him from scratch. And that, I believe, is the great miracle of our relationship, at least for me: that over and over again he seems an entirely new person to me, having to be scrutinized and fathomed over and over again, that I still have to go on absorbing him, that he is material I shall not have finished studying for years. (Hillesum, 2002, p. 353)

This particular exercise book of Etty's is coming to a close in April of 1942. Before the close of this segment of her journal, the "yellow star" was issued. While she says at this moment "I wondered again if I was so "unworldly" simply because the German measures affect me so little personally. But I don't fool myself for one single moment about the gravity of it all." Although she surmises that these measures do not affect her strongly, they are clearly influencing the unfolding of her being. Such as the thought "there will always be suffering, and whether one suffers from this or that really doesn't make much difference. It is the same with love. One should be less and less concerned with the love object and more and more concerned with love itself, if it is to be real love" (Hillesum, 2002, p. 358). Given this realization, Etty has come to a place at the end of April where she wants to marry Spier in order to "get through these times together." In fact, the following passage reveals her own 'pearl beyond price', personal and boundless at the same time:

> I am so glad that he is a Jew and I am a Jewess. And I shall do what I can to remain with him so we can get through these times together…I am not really frightened of anything, I feel so strong: it matters little whether you have to sleep on a hard floor, or whether you are allowed to walk only through certain specified streets, and so on – These are minor vexations, so insignificant compared with the infinite riches and possibilities we carry within us. We must guard these and remain true to them and keep faith with them. And I

> shall help you and stay with you and leave you entirely free. And one day I shall surrender you to the girl you mean to marry. (Hillesum, 2002, p. 355)

Etty's journal has a gap at this very point. Exercise Book 7 was never found, so we meet her again in the middle of May 1943, in Exercise Book 8, where it is clear that the final part of this second journey is brewing. The Diamond Approach would call this the Point work; facing into the empty void. Etty has been confronting painful wounds about the fear of losing love, and now the shell of ego identity losing its power to cover up insecurity and deficiency. Etty's additional confrontation with impending destruction is a multifaceted process: the loss of Spier, of future aspirations of being a writer, a chronicler, as well as facing directly into her own death and the annihilation of her family and her people.

At the end of May, 1943, she was quite reflective as the ever present squeeze of the Nazi's was getting tighter and tighter. The persecution accelerated with constant restrictions and it became clear to Etty that the Nazi machine was intent upon their destruction. Even so, it seems Etty is touching some kind of deep feminine receptivity that sustained her:

> I went to bed early last night, and from my bed I stared out from the large open window. And it was once more as if life with all of its mysteries was close to me, as if I could touch it. I had the feeling that I was resting against the naked breast of life, and could feel her gentle and regular heartbeat. I felt safe and protected. And I thought, how strange. It is wartime. There are concentration camps. Small barbarity mounts upon small barbarity. I can say of so many of the houses that I pass: here the son has been thrown into prison, there the father has been taken hostage, and an eighteen-year old boy in that house over there has been sentenced to death. And these streets and houses are all so close to my own. I know how very nervous people are, I know about the mounting human suffering. I know the persecution and oppression and despotism and the impotent fury and the terrible sadism. I know it all and continue to confront every shred of reality that thrusts itself upon me. (Hillesum, 2002, p. 386)

Around the same period of time, she was continuing to face the ego's inherent deficient emptiness that her relationship with Spier laid bare, and what was evolving in relationship to the emptiness:

> I used to be genuinely hysterical and desperate then. And would have felt betrayed and let down by his failure to console me in my emptiness and sadness. But now I was sitting there perfectly calm and collected, telling myself, you shouldn't be so ambitious, thinking you have to inspire a man every minute. You must accept the fact that you can be empty and tired and just want to get away from him…In the past I would refuse to acknowledge that sort of emptiness in myself, and then make forced attempts on all fronts, from the intellectual, to the erotic and sexual, to restore contact at any price, and if that failed, I would later have orgies of loneliness all on my own….In the past, I would have expected him, and other friends as well, to work miracles of solace. And now, I was bearing my own emptiness, and tiredness, and malaise, and that too was part and parcel of life, and there was no need to feel so forlorn. (Hillesum, 2002, 405)

There is something happening with Etty as she stares into the inner starkness, the emptiness, immanent destruction, and the failings of her own body. She begins to accept, and even embrace the very moment of her unfolding and finds that her ‘love of life has not been diminished.” This seems to be an emerging non-dual experience as well as the human will’s defiance to the Nazi's persecution. While with Etty, the illumination of the boundless dimension gets brighter and more spacious.

Etty’s imagery illuminates the struggle with her body at this time:

> All sorts of things are going out of joint south of my midriff. This mental frame of mine is certainly in need of drastic repair…I really don’t know what to do about it. If I stop eating salt, the kidney may float a little less. But the homeopathic drops and the endless aspirins are of course constantly at loggerheads with each other, waging battle in my 'earthly home'. Oh, yes, that body of mine: all at once I have an image of a battered old ruin, with white doves flying in and out of the holes in the walls –They are my thoughts, and they are more than thoughts; they are the comings and goings, and the movements made by my spirit; between the cracks new young flowers are growing, so touchingly fresh and young among the weathered walls. – and those are my feelings. That’s how I feel suddenly: like a battered old ruin. (Hillesum, 2002, p. 387)

As Etty moves closer and more deeply to the “point of her existence” and wrestles with ultimate questions, she comes to an evolving awareness about what she feels God is to her. It becomes her ongoing inquiry:

> It means gathering together all the strength one can, living one’s life with God and in God and having God dwell within. (I find the word “God” so primitive at times, it is only a metaphor after all, an approach to our greatest and most continuous inner adventure; I’m sure that I don’t even need the word “God” which sometimes strikes me as a primitive, primordial sound—A makeshift construction.) And at night, when I sometimes have the inclination to speak to God and say very childishly, “God, things cannot go on like this with me” – and sometimes my prayers can be very desperate and imploring – it is, nevertheless, it is as if I were addressing in myself, trying to plead with a part of myself. (Hillesum, 2002, p. 440)

When Etty heard the latest news at the end of June, 1942, that all Jews will be transported out of Holland through Drenthe Province (Camp Westerbork) and then on to Poland and Auschwitz, she comes to the realization that God cannot help the Jews. As Patrick Woodhouse discusses, she arrives at the same insight as Dietrich Bonhoeffer writing to his friend from prison just months before he was hanged by the Nazis for attempting a plot to kill Hitler. As Bonhoeffer wrote of the God "weak and powerless" in the world, Etty also comes to the awareness that “God is not accountable to us, but we are to Him,” that what mattered to her was “not whether we preserve our lives at any cost, but how we preserve them.” And so, as Woodhouse summarized, "God becomes to her a vulnerable Presence, to be looked after and cherished in the human heart.” (Woodhouse, 2009, pp. 50-51)

While Etty had tremendous strength of will, as we see in her first response to the news of the transports, “I know about everything, and I am no longer appalled by the latest reports, in one way or the other, I know it all.“ She acknowledges that “though her mind has come to terms with it all, her body hasn’t. It has disintegrated into a thousand pieces” (Hillesum, 2002, p. 456).

Etty now is up against and present to the abyss, death, in any numbers of forms. Her inquiry is fueled by fear, curiosity and love. She says:

> Suffering is not beneath human dignity. I mean: it is possible to suffer with dignity and without. I mean: most of us in the West don’t understand the art of suffering and experience a thousand fears instead. We cease to be alive, being full of fear, bitterness, hatred and despair…And I wonder if there is much of a difference between being consumed here by a thousand fears or in Poland by a thousand lice and hunger? We have to accept death as a part of life, even the most horrible of deaths. (Hillesum, 2002, p. 459)

As mentioned in the Diamond Approach section, its primary method is inquiry, which opens one to the raw, concomitant feelings and experiences of vulnerability. While the defensive structures of the personality are worked through, there is a deep touching of the affect, and an impact on the body/soma that carries such vulnerability in the face of trauma (depression, anxiety, somatic illness). And the more feeling that is integrated, the more fullness that results. Curiosity can lead this process, as a strength that emerges that loves the truth wherever it will lead. Etty’s authenticity is revealed in her immediate response of unflinching strength in the face of overwhelming power and her vulnerable sharing of each disintegration that comes afterward, where the somatic level of her being is seriously compromised until the shock to her sensitive system is metabolized. Her continuous work of deconstruction and integration is the core of her process and that of the Diamond Approach, a system where psychological and spiritual maturity become inseparable. We can see from her poetic response to human suffering, above, to a much more personal response, shortly afterward:

> Yes, I am still at the same desk, but it seems to me that I am going to have to draw a line under everything and continue in a different tone. I must admit a new insight into my life and find a place for it: What is at stake is our impending destruction and annihilation. We can have no more illusions about that. They are out to destroy us completely. We must accept that and go on from there. Today I was filled with terrible despair, and I shall have to come to terms with that as well. And perhaps, or rather, certainly, that is the result of yesterday’s four aspirins. Even if we are consigned to hell, let us go there as gracefully as we can. Why this mood at this particular moment? Is it because I have a blister on my foot from walking through the hot town, because so many people have had sore feet ever since they were stopped from using the trains….Because Liesl stood in a queue and didn’t get any vegetables after all? It is for such an awful lot of reasons, all of them petty in themselves, but all of them part of the great campaign to destroy us. (Hillesum, 2002, p. 461)

Later still:

> I shall not be bitter if others fail to understand what is happening to us Jews. I work and continue to live with the same conviction that life is meaningful- yes, meaningful- although I hardly dare say so in company these days. Living and dying, sorrow and joy, the blisters on my feet and the jasmine behind the house, the persecution, the unspeakable horrors- it is all one in me, and I accept it all as one mighty whole. And begin to grasp it better if only for myself, without being able to explain it to anyone else how it all hangs together. I wish I could live for a long time so that one day I may know how to explain it, and if I am not granted that wish, well, then, somebody else will perhaps do it, carry on from where my life has been cut short. And that is why I must live a faithful life to my last breath: so that those who come after me do not have to start all over again, need not face the same difficulties. Isn't that doing something for future generations? (Hillesum, 2002, p. 461)

So it was, during this time that Etty's confrontation with annihilation prompted the need for the external confirmation of her identity to fall away. Almaas has often called this aspect the 'point', since it is often experienced as a timeless, dimensionless point of light (Almaas, 1996, P. 346). It is during this phase that Etty speaks about her inferiority complex and her perceived deficiencies falling away. She was also beginning to face the inevitability of losing Spier:

> He leaned against the wall in Dicky's room, and I leaned gently and lightly against him, as I had done on countless similar occasions in the past, but this time, it suddenly felt as if the sky had fallen as in a Greek tragedy. For a moment my senses were totally confused, and I felt as though I was standing in the center of infinite space- pervaded by space but also filled with eternity. In that moment a great change took place within us, forever. He remained leaning against the wall for a little and said in an almost plaintive voice, "I must write to my girlfriend tonight, it will be her birthday soon. But what am I to say to her? I haven't the heart for it or the inspiration." And I said to him, "You must start even now and try to reconcile her to the fact that she will never see you again; you must give her something to hold onto for the future. Tell her how the two of you, though physically apart for all these years, have nevertheless been as one, and that she has a duty to carry on if only to keep something of your spirit alive." Yes, that's how people speak to one another these days, and it doesn't even sound unreal anymore. We have embraced a new reality, and everything has taken on new colors and new emphases. And between our eyes and hands and mouths there now flows a constant stream of tenderness, a stream in which all petty desires seem to have been extinguished. All that matters now is to be kind to each other with all the goodness that is in us. And every encounter is also a farewell. (Hillesum, 2002, p. 475)

It is quite clear from this passage that any of Etty's longings that came as a result of deficiency or fear of rejection, have melted into a love larger than what she has known, and in fact she becomes Spier's spiritual 'teacher' as he begins his own process of disintegration. Etty wants to give Hertha hope, and give them both, Spier and Hertha, access to that 'constant stream of tenderness.' This was theirs, Etty and Spier's joint venture, ultimately hastened by facing into annihilation, or 'death before death' as it has been called. We begin to see Etty's preparation for her separation from Spier while she continues to display a deep union of grit and grace, and the following passage reveals it:

> A hard day, a very hard day. We must learn to shoulder our "common fate"; everyone who seeks to save himself must surely realize that if he does not go, another will take his place. As if it really mattered which of us goes. Ours is now a common destiny that I must shoulder myself in prayer… and that part of our common destiny that I must shoulder myself; I strap it tightly and firmly to my back, it becomes part of me as I walk through the streets even now. And I shall wield this slender fountain pen as if it were a hammer, and my words will have to be so many hammer strokes with which to beat out the story of our fate and of a piece of history as it is and never was before. Not in this totalitarian, massively organized form, spanning the whole of Europe. Still, a few people must survive if only to be the chroniclers of this age. I would very much like to become one of their number – . (Hillesum, 2002, p. 484)

Within this great strife, Etty is touching her essence, this deep capacity to hold the whole of her experience. Both to find 'meaning' as her personality covets the rational, analytic meaning making process, yet, we bear witness to the arising fire of her true nature, Being itself. Given the 'extremis' of her moment in human history, we can feel her increased calling "to beat out the story of our fate." An important decision for Etty during this time was the one she made about going into 'hiding.' This decision is one that thousands of Dutch Jews had to make and the one the Frank family made at this moment on July 6th 1942, just three miles away from Etty in South Amsterdam. Within the following week the fifteen year old Anne would begin her diary in the familiar red plaid notebook. Etty, twenty-eight, chose not to go into hiding, a controversial choice with many of her friends, and has engendered multiple critiques since that time. She was clear about this decision, and in fact, was adamant about it, as is described in the story about Klass Smelik, a friend and former lover, and his daughter, Johanna or "Jopie" trying to kidnap Etty into hiding. Klass reports:

> At a certain point, Klass grabbed her and tried to convince her to go into hiding. She wormed herself free and stood at a distance at about five feet from me. She looked at me very strangely and said "You don't understand me," I replied, No, I don't understand what on earth you're up to. Why don't you stay here, you fool!" Then she said: "I want to share the destiny of my people." When she said that, I knew there was no hope. She would never come to us," said Smelik. Others also offered Etty a hiding place, but she steadfastly refused this. (Hillesum, 2002, p. 761)

What is this decision about to share the destiny of her people? As an assimilated Jew without a commitment to formal religious Judaism, and in fact a Marxist earlier in her life, Etty's own evolution of consciousness takes her to this place as her soul's wisdom and clarity intersects this moment in European history. This event in European history has also evolved as Gebser (1949/1985) might say, moving from the magical, to mythical, to the mental. This changed the fabric of human consciousness by moving beyond crimes of passion and dominance (magical, mythical) to the mental, scientific, systematic dehumanization and ultimate genocide of those not considered a pure race, an Aryan race. As Etty faces into this kind of annihilation, she is never far from 'God' or her own soul, the very sparks of that divine essence that she communes with, and, more importantly***, is***. At one of the darkest hours she says:

> Dear God, these are anxious times. Tonight for the first time, I lay in the dark with burning eyes, as scene after scene of human suffering passed before me. I shall promise You one thing, God, just one very small thing: I shall never burden my today with cares about my tomorrow, although that takes some practice… I shall try to help you, God, to stop my strength ebbing away, though I cannot vouch for it in advance. But one thing is becoming increasingly clear to me: that You cannot help us, and we must help You to help ourselves. And that is all we can manage these days and also all that really matters: that we safeguard that little piece of You, God, in ourselves. And perhaps in others as well. Alas, there doesn't seem to be too much You Yourself can do about our circumstances, about our lives. Neither do I hold you responsible. You cannot help us, but we must help You, and defend your dwelling place within us to the last. (Hillesum, 2002, p. 488)

This protecting or 'safeguarding' of this cherished soul or essence or 'piece of You' in herself and others was Etty's destiny, and moved from a flicker to a flame and back again throughout this short time of her human existence. At the end of this exercise book 10, she was coming near to the time of going to Westerbork, the transit camp to Auschwitz, located in Drenthe Province. It is now her time to say goodbye to life as she has known it, which is the very heart of radical spiritual transformation. It will not be easy as she confesses that she feels

> … that I am still tied by a thousand threads to everything I treasure here. I will have to tear myself away bit by bit and store everything inside me, so that when I have to leave I shall not abandon anything but carry it all with me. There are times I feel like a little bird, tucked away in a great protective hand. (Hillesum, 2002, P. 509)

And, tear herself away, she did. Etty was on her way to Camp Westerbork, a decision she made, as more and more Jews were being rounded up. Spier had recently been ill and she watched him beginning to deteriorate. She did not know, consciously, that he would be dying of cancer during her first six-week period at Westerbork.

When it became known that appointments to the Jewish Council could offer temporary protection from deportation, many people applied for work (Hillesum, 2002, p. 740). It seems likely that Etty, having received the 'normal' summons for Westerbork, had been urged to apply for work at the Jewish Council by Jaap and a certain Loopuit. She probably felt guilty about this and reported to the recently established 'Westerbork department', a sub-department of the Jewish Council in Amsterdam. She was officially appointed as stenographer; her field was 'Social Welfare for people in Transit' at Westerbork. And on July 30th, she arrived at Westerbork with the first staff members of the Jewish Council (p. 740). As she says: "Nothing can ever atone for the fact that one section of the Jewish population is helping to transport the majority out of the country. History will pass judgment in due course"(Hillesum, 2002, p. 511).

As her time with Spier was coming to a close, she has a profound experience of the power of divine eros:

> On Sunday morning I was curled up on his floor in my big striped dressing gown, darning socks. Water can be so clear that you can see right through it and distinguish everything on the bottom... What I really wanted to say is: it suddenly felt as if life in its thousand details,

> twists, and turns had become perfectly clear and transparent. Just as if I were standing before an Ocean and could look straight through the crystal clear water to the bottom. I doubt very much if I will ever be able to write – or shall I yet? It may take a long time before I can describe this moment, a high point in my life. You huddle in the corner on the floor of the room of the man you love and darn his socks and at the same time you are sitting by the shore of a mighty Ocean so transparent that you can see the bottom. And that is an unforgettable experience… (Hillesum, 2002, p. 512)

Etty was also having second thoughts about marrying Spier. As much as they spoke about staying together through the war, both came to the realization that marriage was not the purpose, it was love. Spier also felt he did not want to bind Hertha to him in this way (marriage), given his age. Etty, while speaking of this with Spier, thought to herself, “You look so ill, so terribly tired, and loving you as much as I do, the worst thing that could happen to me would be to sit by and watch you suffer” (Hillesum, 2002, p. 509). She begins to realize:

> To put it quite soberly and bluntly the differences in our ages is too great. I have already seen a man (Han) change before my eyes in a few years. I see him changing too. He is an old man whom I love, love infinitely, and to whom I shall always be united by an inner bond. But “marry” what the worthy citizen calls marry, I must, in all seriousness and honesty, say finally that I don’t want to. And the fact that I have to go my own way all by myself gives me a great feeling of strength. (Hillesum, 2002, p. 511)

Around this time she asserts, “There is a vast silence in me that continues to grow. And washing around in it are so many words that make one tired because one can express nothing with them. One must do more and more without meaningless words the better to find the few one needs. And in the silence new powers of expression must grow" (Hillesum, 2002, p. 512).

Etty was preparing, or being prepared for the next steps in her evolution. She found comfort in the words of Rainer Marie Rilke, her poetic partner in transformation, as she says, “I read a bit more of Rilke and discovered the following passage; the words greeted me as if they were my closest family":

> And suddenly as if through clear tears, you have a vague inkling that, even as a lover, you need solitude, that sorrow, not injustice, is meted out to you and envelops you when, in the midst of an overwhelming urge to reach out to the beloved person, it suddenly dawns on you: yes, you can only develop and make complete even this apparently most closely shared fellowship, which is love, by yourself, separately; if only because in the union of strong affections you set up a current of pleasure that carries you along and finally casts you out; whereas if you are enveloped in your own feelings, love becomes a daily task performed on your own self and a constant series of bold and magnanimous challenges to the other. Beings who love each other in this way call up infinite dangers around them, but they are safe from the petty risks that have frayed and crumbled so many great emotional beginnings. Because they always hope for, and expect, the utmost from each other, neither can wrong the other through limitation; on the contrary they incessantly create space and breadth and freedom for each other. (Hillesum, 2002, P. 81)

It is here on the eve of Etty’s first journey to Westerbork that the line will be drawn, however arbitrarily, between Etty’s Second and Third Journey. Both the individuation process and realization of true nature are focused on dissolving the ego and its limiting narcissism, and at the end of journey two the soul begins to know her essence as her identity. The duality of soul and essence begins to be bridged and the soul moves into the third journey. "The soul recognizes she is the simplicity and exquisiteness of timeless presence" (Almaas, 2004, p. 224). It is to the third journey or that of the boundless dimension that we will now turn.

Journey 3: Etty Hillesum

Truly, my life is one long hearkening unto myself and unto others, unto God. And if I say that I hearken, it is really God who hearkens inside of me (Hillesum, 2002, p. 519).

From the frame of the Diamond Approach, the first phase of Journey Three is the essential development of the soul, and this is illustrated in the above quote of Etty's. The soul merges with essence so completely that the two become one. This non-dual soul is a dynamic presence that all experience arises from, and Etty's reveals her non-dual soul in the experience of God inside her. Her soul is totally immersed with the presence of love.

When Etty returned from Westerbork on leave to Amsterdam six weeks later, the world had turned yet again. Not only did she become ill with what she later learned was kidney stones, but she had to face Spier’s imminent death. She saw him for the last time with some awareness on his part on September 11th and according to her friend Tide’s diary, “Etty had returned from her visit to him, broken. Which is not surprising: he is no longer himself. At first he didn’t recognize her. Later he did. He also said something: that she was not only a woman but also 'very clever'” (Hillesum, 2002, p. 750).

It is through this transition and the one of being at Westerbork that we see this explosion toward the increasing boundless dimension of Etty’s being. The day of Spier’s death is when she put pen to paper again after a six week hiatus. She acknowledges that “everything coming together like that was a little hard.”

She goes on to say that:

> I am a little numb and bewildered and helpless, but at the same time I am trying to scrape together what patience I have from all the corners of my being, and I shall have to find a new kind of patience to meet this entirely new state of affairs. I shall follow the tried and tested old method, talking to myself now and again on these faint blue lines. And talking to You God, Is that all right? With the passing of people, I feel a growing need to speak to You alone. I love people so terribly, because in every human being I love something of you….But now I need so much patience and thought, and things will be very difficult. And now I have to do everything by myself. The best and noblest part of my friend, of the man whose light You kindled in me, is now with you. What was left behind was a childish, worn-out husk in the two small rooms in which I experienced the greatest and deepest happiness of my life. I stood beside his bed and found myself standing before one

> of Your last mysteries, my God. Give me a whole life to contain it all. (Hillesum, 2002, p. 514)

And, to Spier:

> There you lie now in your two small rooms, you dear great, good man. I once wrote to you, "My heart will always fly to you like a bird, from any place on earth, and it will surely find you….And even if they flung me into a dungeon, that piece of heaven would still spread out within me and my heart would fly up to it like a bird, and that is why everything is so simple, so terribly simple and beautiful and full of meaning." I had a thousand things to ask you and to learn from you; now I will have to do everything by myself. But I feel so strong that I'm sure I'll manage. What energies I possess have been set inside me. You taught me to speak the name of God without embarrassment. You were the mediator between God and me, and now you, the mediator, have gone, and my path leads straight to God. It is right that it should be so. And I shall be the mediator for any other soul I can reach. (Hillesum, 2002, p. 516)

It is here that Etty suggests what has been happening all along, that she has moved from a possessive kind of love, to an idealistic one, to an integration and expansion of Spier's and her consciousness. At this part of her journal, the transmission from the page is palpable, and the reader is struck by the presence of Being as she touches it directly:

> My love of life is so great and so strong and calm and makes me so grateful that I shall refrain from putting it into words again. There is such perfect and complete happiness in me, oh God. What he called "reposing in oneself." And that probably best expresses my own love of life: I repose in myself. And that part of myself; that deepest and richest part in which I repose, is what I call "God." (Hillesum, 2002, p. 519)

It was at this point that Etty's body has "called a halt" to her activity, as she says that she "must rest awhile "if I am to do what I have to do." She continues: Even if one's body aches, the spirit can continue to do its work, can it not? It can love and hineinhorchen – "hearken unto"- itself and unto others and unto what binds us to life. Hineinhorchen – I so wish I could find a Dutch equivalent for that German word. Truly, my life is one long hearkening unto myself, and unto others and unto God. And if I say that I hearken, it is really God who hearkens inside me. The most essential and the deepest in me is hearkening unto the most essential and deepest in the other. God to God. (Hillesum, 2002, p. 519)

These lines of Etty's reveal how her soul has completed the process that the Diamond Approach calls 'essentialization'. Her soul has now realized a nondual state that is loving in a complete and full way. The divine presence of her soul is able to see, touch, and love the divine in others. Her soul has a dynamic presence that expresses itself as loving action. This is the "thinking heart of the barracks", as she called herself in her two months at Westerbork. She continues with wishing to put it all into words:

> Those two months behind barbed wire have been the richest and most intense months of my life, in which my highest values were confirmed. I have learned to love Westerbork.

> Yet when I fell asleep in my narrow plank bed there, what I dreamed of was the desk behind which I now sit and write. (Hillesum, 2002, p. 520)

Etty describes Westerbork as a "new focus of Jewish suffering" as it is a "camp for a people in transit, great waves of human beings constantly washed in from the cities and provinces, from rest homes, prisons, and other prison camps, from all the nooks and crannies of the Netherlands, only to be deported a few days later to meet their unknown destiny" (Hillesum, 2002, p. 583). She gives some physical characteristics of the place, with the words: "There is mud, so much mud that somewhere between your ribs you need to have a great deal of inner sunshine if you don't want to become the psychological victim of it all." She makes sure to add the effects of "broken shoes and wet feet." The barbed wire, of course was another feature. "If the barbed wire just encircled the camp, at least you would know where you were. But these twentieth century wires meander about inside the camp, too, around the barracks and in between, in a labyrinth and unfathomable network…. Anyway, it is terribly crowded in Westerbork, as when too many drowning people cling to the last bit of flotsam after a ship has sunk…" (Hillesum, 2002, pp. 583-584).

As a prelude to the second phase of the Third Journey, Etty gives us a glimpse of her unfolding nondual filter through which she glimpses Reality:

> The sky is full of birds, the purple lupines stand up so regally and peacefully, two little old women have sat down on the box for a chat, the sun is shining on my face – and right before our eyes, mass murder. The whole thing is simply beyond comprehension. (Hillesum, 2002, p. 602)

The second phase of the third journey is the discovery of the boundlessness of true nature. This can be seen in the second part of Etty's third journey as a 'seeing through' the limited boundaries of individuality, and of time and place to experience her soul as this "eternal newness that transcends all time and as a mystery that transcends all determinations." Etty's soul now experiences itself as boundless and transcending her individual perspective. This is best described in Etty's riveting words:

> I once wrote in my diaries, "I would like to run my fingertips along the contours of these times." I was sitting at my desk with no idea what to make of life. That was because I had not yet arrived at the life in myself; was still sitting at this desk. And then I was suddenly flung into one into one of many flashpoints of human suffering. And there, in the faces of people, in a thousand gestures, small changes of expression, life stories, I was suddenly able to read our age – and much more than our age alone. And then it suddenly happened: I was able to feel the contours of these times with my fingertips. How is it that this stretch of heathland surrounded by barbed wire, through which so much human misery has flooded, nevertheless remains inscribed in my memory as something almost lovely? How is it that my spirit, far from being oppressed, seemed to grow lighter and brighter there? It is because I read the signs of the times and they did not seem meaningless to me. Surrounded by my writers and poets and flowers on my desk, I loved life. And there among the barracks, full of hunted and persecuted people, I found confirmation of my love of life. Life in those drafty barracks was no other than life in this protected, peaceful room.

> Not for one moment was I cut off from the life I was said to have left behind. There was simply one great meaningful whole. Will I be able to describe all of that one day? (Hillesum, 2002, p. 526)

In reading Etty's words from the Diamond Approach perspective we can see “that co-emergent with these boundless dimensions is the constant upwelling, flow, and completely fresh experience of being in each moment" (Davis, J., Usatynski, T., and Ish-Shalom, Z, 2013, p. 572). The soul’s journey of Etty Hillesum has been moving toward this realization throughout this brief account of her life. We experience many moments of this ‘upwelling’,’ flow’ and ‘freshness’ or immediacy in Etty’s inner and outer discoveries. The further differentiations of the boundless dimensions that Almaas lays out include Divine Love, the Supreme, the Nonconceptual, the Logos, and the Absolute (Almaas, 2004). For the purposes of this paper, the ‘Absolute’ will suffice to convey the whole of all the aspects of this term, providing the basis of spaciousness, presence, nonduality and unlimited potential in all experience.

Journey 4: The Journey of Descent

Now that the soul has journeyed into the mystery and transcended all limitations, it flows back into the multitude of forms and objects of the phenomenal world. As the soul does so, it maintains its connection to the Absolute and true nature that it has discovered, but integrates Being into the manifestations of the phenomenal world. The journey of ascent was a movement inward, while the journey of descent is a movement outward into the world of forms and objects, which leads to integration and union with the whole (Almaas, 2004). This journey involves understanding the Absolute not only as a transcendent truth but also as the immanent ground of reality. Like the previous two journeys, this one involves the two phases of self-realization and individuation. There develops a deeper understanding of the functional relationship between true nature and the individual soul, and the relationship between soul, Being or God in Etty’s case, and the cosmos. In the descent, the soul finds its place in the cosmic reality.

The journeys of ascent and descent are not separate linear processes, but are present simultaneously, co-existing and co-emerging. The journeys complement each other and are equally important. "Immanence, fullness, and the myriad forms of the world are one side of a coin; transcendence, emptiness, and the mystery of union are the other. Thus, the richness and beauty of the world are no more true, valuable, or privileged than its emptiness, spaciousness and vastness" (Davis, 1999, p. 153).

As Etty comes to the end of her recuperation in Amsterdam, and prepares herself to return to Westerbork, we see her soul’s movement toward the realization of the boundless dimensions of the Absolute and its expression in the world. Etty faces moving back into one of the forms of the ‘world’: the concentration camps and debacle of the Holocaust. She prepares to go back, knowing that Westerbork will now be overflowing with people. The transports to Auschwitz will be much more frequent, in fact, speeding to their destination to beat the allies in these last 18 months of the war. Her preparation includes reflections about suffering, and how to free herself from the ideas of it. She says:

> I know how to free my creative powers more and more from the snares of material concerns, far from the *idea* of hunger and cold and danger. They are, after all, *imaginary* phantoms, not the reality. Reality is something one shoulders together with all the suffering that goes with it, and with all the difficulties. And as one shoulders them, so one's resilience grows stronger. But the idea of suffering (which is not the reality, for real suffering is always fruitful and can turn life into a precious thing) must be destroyed. And if you destroy the ideas behind which life lies imprisoned as behind bars, then you liberate your true life, its real, its real mainsprings, and then you will also have the strength to bear real suffering, your own and the world's –. (Hillesum, 2002, p. 537)

This period of waiting to go back to Westerbork was one of her times of digestion and integration of all that has gone before and she finds herself in a poetic, boundless state of consciousness, right along with worry for her parents. She muses about poetry and feels that "there is no hidden poet in me, just a little piece of God that might grow into poetry." She continues to say that "a camp needs a poet, one who experiences life there, even there, as a bard and is able to sing about it." She remembers her first time at Westerbork and the women and girls that surrounded her plank bed who would often tell her that they did not want to think or feel, as they were sure to 'to go out of their minds.' She recalls an exquisite moment in the barracks one night:

> I was sometimes filled with an infinite tenderness, and lay awake for hours letting all the many, too many impressions of a much too-long day wash over me, and I prayed, "Let me be the thinking heart of these barracks." And that is what I want to be again. The thinking heart of a whole concentration camp. I lie here so patiently and now so calmly again that I feel quite a bit better… . (Hillesum, 2002, p. 543)

This realization of the boundless dimension and her own true nature fortifies her essential strength, or the red essence, as well as her true will to persevere in the face of suffering, as the Diamond Approach would describe it, for this fourth journey or the one of descent. While the word descent is used to convey movement into the world with the realization of one's essential or true nature, or Being itself, in this particular instance descent could also convey a metaphor of descending into a hell on earth. Either way, this last part of her journey on earth, was consciousness itself witnessing the direct effects of this heinous destructive power of the human condition cut off from its essential nature.

When Etty arrived at Westerbork during the first week of June, 1943, she was struck by the desperate chaos of the place that she initially experienced as one of community and bonding with the staff and its 1,000 'citizens.' It now held 10,000 people living in gravely subpar conditions. Overall, Etty's continual concerns and struggles for herself, her family and the inhabitants had to do with exceedingly poor hygiene. Exacerbating these poor conditions for Etty was the sandy terrain and wind, with sand getting into people's eyes, food and bodies causing ever-present Illness; the constant anxiety and terror of who would be chosen for the next transport to Auschwitz; and the role of working in the hospital as a person who both comforted and assisted people in touching something within themselves that would not/could not be crushed by this destructive force. She was also quite concerned about her parents' health and wellbeing and managed the process of writing to friends asking them to send rations and occasionally small delicacies such as butter, cakes or chocolate.

On her first night back at Westerbork, she was greeted by an abundance of mice, crowding, and a new transport from Vaught, a concentration camp considered notoriously barbaric, which had come in that night and early morning. She relays the horror:

> First of all, we underwent a lysol treatment, because so many lice always arrive from Vaught. From four to nine a.m. I dragged screaming children around and carried luggage for exhausted women. It was hard going, and heart-rending. Women with small children, 1,600 (tonight another 1,600 will arrive); the men had been deliberately kept back in Vaught….In Vaught, two or three children die every day. An old woman asked me helplessly, "Could you tell me, please could you tell me, why we Jews have to suffer so much." I couldn't answer. (Hillesum, 2002, p. 600)

One gets a further glimpse of this scene from one of the staff at Westerbork, Friedrich Weintraub, who wrote a book after the war, "Collaboration and Resistance, 1940-1945", and he describes the scene:

> And Etty Hillesum arrived with her dispatch bag – couldn't speak a word, only cry. She sat on a chair between Weyl's bed and mine, with her face buried in a handkerchief. Loonstijn called out: "My good girl, for heaven's sake stop, we have troubles enough we don't need any wailing women around." This helped a bit and Etty started telling us what she had seen…. However Etty soon started crying again. We let her do so, and it did help – at least then you don't have to cry yourself. (Hillesum, 2002, p. 762)

Etty, over her short time at Westerbork, faced many people forced into desperation who did not have any inner reference point, whether very young, their parents, or the very old. She speaks about a young girl who was partly paralyzed, and has just been learning to walk again. The girl says to Etty " Have you heard? I have to go."

Etty describes the encounter:

> We look at each other for a long moment. It is as if her face has disappeared; she is all eyes. Then she says in a level gray little voice, "Such a pity, isn't it? That everything you have learned in life goes for nothing. And, How hard it is to die." She looks at me for a long time in silence, searchingly, and then says "I would like, oh, I really would like to swim away in my tears." (Hillesum, 2002, pp. 646, 648)

And another:

> She grabbed hold of me; she looked deranged. A flood of words poured over me: "That isn't right, how can that be right? I've got to go, and I won't even be able to get my washing dry by tomorrow. And my child is sick, he's feverish, can't you fix things so that I don't have to go?....Can't you take my child for me? Go on, please, won't you hide him; he's got a high fever, how can I possibly take him along?" She points to a little bundle of

> misery with blonde curls and a burning, bright red little face. "….my child," and then she sobs, "They take the sick children away, and you never get them back."
>
> God Almighty, what are You doing to us? The words just escape me. (Hillesum, 2002, pp. 646-647)

These excerpts let us know she was in full contact with her emotions and her strength was born of her vulnerability. In her letters to others we see her essential strength/will and get a glimpse of what she conveys to others, as if wanting to infuse them, then and there, with the spiritual will to refuse to succumb their soul's richness to the evil of this killing machine. As she stood at the tub one morning with a colleague, she says:

> The realms of the soul and the spirit are so spacious and unending that this little bit of physical discomfort and suffering really doesn't matter all that much. I do not feel I have been robbed of my freedom; essentially, no one can do me any harm at all….Yes, children, I am in a strange state of mournful contentment. If I once wrote you a desperate letter, don't take it too much to heart; it expressed only a brief moment. It's true you can suffer, but that need not make you desperate. (Hillesum, 2002, p. 611)

The worst part of Etty's anguish was relegated to the care and responsibility she felt toward her parents as well as the continuous fear of them being placed on the 'next transport' to Auschwitz. She actually comes to "admire them tremendously" for the way they are coping with the misery of their situation. She particularly develops a connection with her father, someone she has always admired, and watches him give lessons to a few students in Greek and Latin, "reads a great deal, philosophizes with ancient rabbis and old student friends, and now and then strolls with his daughter through the dusty sand of the hospital grounds" (Hillesum, 2002, p. 625). "We chuckle together a lot", she says, "Father and I; you can't really call it laughing. He has a primitive sense of humor, which becomes more profound and sparkling as the grotesque process of his reduction to poverty assumes ever more wretched dimensions." Keeping her parents off the transport list became her focus in the last months at Westerbork. She writes to a friend:

> Tense and stirring days behind us. Father was on the transport list. We were able to get him off once again. I must explain that the call-ups for the transports come in the middle of the night, a few hours before the train leaves. If people are still needed at the last minute to fill the quotas, then Jews are seized here and there at random from the barracks. And that's why the days before the transports are so nerve wracking. The day afterward I fainted twice, but I'm fine again now – until the next transport…. I have got used to the idea that I'll have to go myself one day. Above all else in the world I wish I could spare my parents and my brothers. But you can't play the ostrich here; a transport leaves every week, and the quota must be filled. Just a little while longer and all our turns will come. (Hillesum, 2002, p. 625)

Amidst all of this numbing chaos, Etty reflects on the totality of her experience in one of her letters:

> All I wanted to say is this: The misery here is quite terrible; and yet; late at night when the day has slunk away into the depths behind me, I often walk with a spring in my step along the barbed wire. And then, time and again, it soars straight from my heart – I can't help it, that's just the way that it is, like some elementary force – the feeling that life is glorious and magnificent, and that one day we shall be building a whole new world. Against every new outrage, and every fresh horror, we shall put up one more piece of love and goodness, drawing strength from within ourselves. We may suffer, but we must not succumb. And if we should survive unhurt in body and soul, but above all in soul, without bitterness and without hatred, then we shall have a say after the war…. Life here hardly touches my deepest resources – physically, perhaps you do decline a little, and sometimes you are infinitely sad – but fundamentally, you keep growing stronger. (Hillesum, 2002, pp. 616-617)

And indeed her turn did come with a sudden order from The Hague. Her friend Jopie let her friends and family know that

> … for Etty it was a complete surprise –she had decided that she was not going to travel with her parents, and would have much preferred to go through these experiences without the pressures of family ties. For her it was a slap in the face, which did in fact, literally, strike her down. Within the hour, however, she had recovered and adapted herself to the new situation with admirable speed. (Hillesum, 2002, p. 666)

Etty Hillesum's last words to her friend, Christine Nooten, and to the ages were written on a postcard thrown out of the train on September 7th, 1943, found by farmers outside Westerbork camp and posted by them. It says:

> Christine,
>
> Opening the Bible at random I find this: "The Lord is my high tower." I am sitting on my rucksack in the middle of a full freight car. Father, Mother and Mischa are a few cars away. In the end, the departure came without warning. On sudden special orders from The Hague. We left the camps singing. Father and Mother firmly and calmly, Mischa too. We shall be traveling for three days. Thank-you for you for all your kindness and care….
>
> Good-bye for now from the four of us. Etty. (Hillesum, 2002, p. 658)

Etty Hillesum died on 30th of November at Auschwitz.

Journey Four ends with Etty's physical death. What became more and more clear is that Etty's life reflected the "unfolding and expression of the Absolute as it becomes manifest in the world" (Davis, J., Usatynski, T., & Ish-Shalom, Z , 2013, p. 573). The experience of the full realization of essence is rare, and when we experience it, as it seems with Etty, "we know what pure consciousness is, that it is beyond the sense of aliveness more fundamental than life" (Almaas, 2004, p. 128). We don't know the exact details of Etty's death, but we can well imagine that she died with the same courage with which she lived. Courage and strength born not only of her vulnerability, but the strength of her lived experience that she was free, that her essence or soul was unfettered. According to a recent lecture on the 'Fear of Death' by Karen Johnson of the Diamond Approach, the continuous endings or cessations we experience in life offer us practice, the practice of befriending death, of walking with it, instead of opposing it. Each time we move into a ceasing of expression, in any number of ways, the ego experiences it as death. The practice is to keep working through the levels of cessation. "We die alone", says Johnson," not separate" (Johnson, 2013). We can see in Etty's fourth journey, that she repeatedly experiences the wrenching of separation, loss and death testing her realization. She continuously had the experience of 'some elemental force' soaring from her heart, after each integration of suffering.

As we have seen from Etty's experiences in Journey Four, she not only has come back into the 'world' as an awakened being, but she has come back into an accelerated distorted, mechanized 'world' of transit and concentration camp destruction. In this world we are reminded of how much Etty has become realized, has indeed, unfolded toward Being itself. She became the light in the darkness or the "Thinking heart of the barracks" a presence who could hold the qualities of inquiry, change, cessation and love in one spacious whole.

Conclusion

The purpose of this paper was to examine the unfolding or evolving of Etty Hillesums's consciousness through the Integral perspective lens. Etty has been placed in this field of study by the author as her journey of transformation is exemplary of the Integral systems that are inclusive of a non-dual ground of existence, development of the deepest human potentials, and participation in the evolutionary force of Being (Chaudhuri, 1965). Aurobindo and Gebser have served as the historical lineage of this perspective, while Almaas and Johnson have provided the current logos and practice of presence from which to delineate Etty's process.

Etty, as a self-realized chronicler, philosopher, therapist and teacher has become one of their numbers. As she said:

> I shall become the chronicler of our adventures. I shall forge them into a new language and store them inside me should I have no chance to write things down. I shall grow dull and come to life again, fall down and rise up again, and one day I may perhaps discover a peaceful space round me that is mine alone, and then I shall sit there for as long as it takes, even if it should be a year, until life begins to bubble up in me and I find the words to be borne. (Hillesum, 2002, p. 540)

In terms of the Diamond Approach, Almaas has acknowledged that "no path can provide a full and final description of reality, and indeed, this view is expressed in the Diamond Approach's continuing evolution as a spiritual system" (Davis et al, 2013, p. 573). While no mystery can be encompassed by one spiritual path or tradition, as all paths or traditions are part of the largeness of Etty's consciousness, and why so many can relate to her vision. As A. H. Almaas concludes: "The Diamond Approach recognizes that all experiences, perspectives, and dimensions are co-emergent and always existing, at least in potential…. Because it is so radically open, this view includes all other views of individual realization, enlightenment, mystical union, and liberation" (Davis, J., Usatynski, T., & Ish-Shalom, Z., 2013, p. 574).

He has called this all inclusive perspective the "View of Totality." While we might also call this view Integral, or Wholeness, the implications of its potential, "both in daily life and the spiritual journey are limitless" (Davis, J., Usatynski, T., & Ish-Shalom, Z, 2013, p. 574). We can see and often experience through her transmission, Etty's consciousness as Love, driven by the flame of Truth as her essential aspects that continue to glow today. Her essence impacts us, as unconditioned Freedom independent of context. She became a chronicler not only of the distorted contours of her 'time' but far beyond it.

> *I live my life in widening circles*
> *that reach out across the world.*
> *I may not complete this last one*
> *but I give myself to it.*
> *I circle around God, around the primordial tower.*
> *I've been circling for thousands of years*
> *and still don't know: am I a falcon,*
> *a storm, or a great song?*
> Rainer Maria Rilke (1996, p. 45)

Studies of Wisdom: A Special Issue of Integral Review

Roger Walsh and Jonathan Reams, Editors

> Wisdom is radiant and unfading,
> and she is easily discerned by those who love her,
> and is found by those who seek her….
> To fix one's thought on her is perfect understanding,
> And one who is vigilant on her account
> will soon be free from care.
> *The Wisdom of Solomon,* 6:12, 15.

Across cultures and centuries, wisdom has long been regarded as one of the greatest of all virtues. Yet in recent centuries wisdom largely disappeared from Western awareness, and the *Routledge Encyclopedia of Philosophy* laments that "the concept of wisdom has come to vanish almost entirely from the philosophical map." So much has it disappeared that when one of us (RW) became interested in the topic and asked the chair of the University of California philosophy department what to read, he replied "Well, we made a great start 2,500 years ago, but things have gone downhill from there."

Why it disappeared is an intriguing question awaiting an integral analysis, but that it disappeared is a tragedy. For like the sorcerer's apprentice, humankind now possesses enormous knowledge, awesome power, and little wisdom, and that imbalance is a recipe for disaster. As Robert Sternberg (2003), former president of the American Psychological Association lamented, "If there is anything the world needs, it is wisdom. Without it, I exaggerate not at all in saying that very soon there may be no world (p. xviii)." Humankind is now in a race between sagacity and catastrophe.

Fortunately, there is now growing interest in wisdom in psychology, where publications—which only forty years ago were virtually nonexistent—increased seven fold from the 1970s to 2008 (Meeks & Jeste, 2009). Reviews are now available on general wisdom (Baltes, 2004; Baltes & Staudinger, 2000; Brugman, 2000; Staudinger & Glück, 2011; Sternberg & Jordan, 2005) as well as on the varieties or subtypes of wisdom (Trowbridge & Ferrari, 2011; Walsh, 2011, 2012) including personal and practical wisdom (Ferrari & Westrate, 2014; Küpers & Pauleen, 2013; Staudinger, 2014). Measurement scales have been compared (Gluck et al., 2013) and diverse perspectives have been applied to sagacity studies such as cross-cultural (Walsh, 2014; Yao, 2006) philosophical (Cooper, 2012; Curnow, 1999), and integral (Walsh, 2012). There have also been reviews of the implications of wisdom for aging (Sternberg, 2005) and psychotherapy (Germer & Siegel, 2012), for transmission across cultures (Walsh, 2009), and for education (Bassett, 2011; Ferrari & Potworowski, 2008; Maxwell, 2014; Steele, 2014; Trowbridge, 2007).

SOME RIGHTS RESERVED

But the wisdom being researched is far from the kind of wisdom that was historically valued. What is usually studied by experimental measures is practical wisdom, or what was traditionally known as *phronesis*. That's important, of course. However, it is also far removed from the deeper transrational wisdom sought in the world's religious and contemplative traditions, a wisdom variously known as *prajna* (Buddhism), *jnana* (Hinduism), *gnosis* (Christianity), *ma'rifah* (Islam), or c*hokhmah* (Judaism). This wisdom is not only transrational, but also soteriological, i.e. capable of bringing enlightenment, liberation, or salvation. As the Hindu sage Shankara put it, "Just as there is no cooking without fire, so freedom cannot be accomplished without wisdom" (Freke, 1998, p.56).

But of course transrational wisdom – or transrational anything – doesn't fit into the conventional mainstream psychological framework, and can't be easily measured. What gets researched is what does fit within that framework, and what can be measured. Measurement and qualitative experiments are enormously important, but they are also partial. For not everything that matters can be measured, and not everything that counts can be counted. The result is that the deeper dimensions of wisdom are being overlooked. As Wittgenstein (1953) warned, "The existence of the experimental method makes us think we have the means of solving the problems which trouble us; the problem and method pass one another by" (p. 232). No wonder Richard Trowbridge (2011) titled an article "Waiting for Sophia."

In addition, current psychological research is little informed by philosophy or cross-cultural studies. For example, *The Handbook of Wisdom* (Sternberg & Jordan, 2005) has only two pages on "Eastern wisdom" despite the fact that Eastern philosophical-religious-contemplative traditions have focused on wisdom for millennia.

What is needed is an intellectual framework comprehensive enough to situate and integrate all forms of wisdom: rational and transrational, psychological and philosophical, religious and contemplative, Eastern and Western. Today there are various theoretical approaches emerging from diverse sources that address this need for a comprehensive, integrative meta-framework that can encompass such a range of approaches to phenomenon. Integral theory as developed and articulated by Ken Wilber, with its encompassing synthetic conceptual framework, seems ideally suited for this kind of comprehensive integrative approach. This special issue of *Integral Review* represents a first small step in bringing Wilberian integral theory[1] and wisdom studies together.

The confluence of wisdom and integral studies offers several potential benefits. The first is simply to encourage the renaissance of interest in wisdom. The second is obviously to begin to integrate these two fields for their mutual enrichment. The third potential benefit is to clarify the relationship between wisdom and development. Many researchers assume that wisdom is associated with higher stages of development, but the nature of this association remains vague. With a deep interest in development and its implications, integral studies may have much to offer here.

---

[1] We will write 'integral theory' in its generic form for convenience and it is to be understood that we are referring more specifically to Wilber's articulation of the term.

Wisdom has been a worldwide pursuit throughout history, and religious-philosophical systems such as Judaism, Confucianism, and Daoism, as well as psychologies such as yoga and Buddhism, have explored wisdom for thousands of years (Walsh, 2014; Yao, 2006). With their long term interest in cross-cultural studies, integral researchers are well situated to adopt and encourage a more global approach to wisdom.

This issue offers a variety of integrally informed studies of wisdom. While drawing on the work of seasoned wisdom researchers, we particularly wanted to highlight the work of younger researchers who recently completed their theses. These include Drew Krafcik, Sharon Spano, Jonathan Rowson, and Juliane Reams.

Drew Krafcik and Sharon Spano both studied a topic of great interest to both wisdom and integral researchers. Their central questions were, "Is wisdom intimately related to psychological development, and especially to postconventional or transpersonal development? If so, what is the nature of that relationship?"

Drew Krafcik did a much needed and all too rare kind of study. He examined – not average people, who have been the usual subjects of wisdom studies – but rather wisdom exemplars, i.e. people viewed by their peers as exceptionally sagacious. Moreover, he performed both qualitative and quantitative studies – in-depth interviews as well as a variety of standard psychological measures of personality and performance, including the Washington University Sentence Completion Test (WUSCT). The result is an exceptionally rich study of exceptional people.

Sharon Spano also focused on questions of development. However, her work used business leaders to look for a relationship between wisdom and ego development as measured by the SCTi-Map (Susanne Cook-Greuter's version of the Sentence Completion Test). She also examined nuances between and within developmental stages and reflective, cognitive and affective dimensions of wisdom. Both her study and Krafcik's found only modest evidence for a straightforward relationship between wisdom and developmental stages.

Jonathan Rowson is an intriguing polymath who has been a grandmaster and British chess champion, a student of diverse topics ranging from philosophy and psychology to culture and spirituality, and has written on topics as diverse as chess, climate change, and spirituality. The interview with him by Jonathan Reams (who also provides a brief overview of Rowson's (2008) dissertation as background) is similarly wide-ranging and beautifully demonstrates an integral mind at work. It also begins to enter into some of the less researched territory noted above by bringing questions of soul and spirituality into the conversation about wisdom.

One of the crucial questions of our time is whether we can find ways to cultivate wisdom. This was the central question for contemplatives and philosophers throughout most of history. Juliane Reams approached this question by studying students in a nontraditional educational format which included an emphasis on happiness and wellbeing. Juliane was intrigued by the possibility that this curriculum might also foster wisdom and sought to understand how the seeds of wisdom might be sown in such a setting. This is a vitally important question because if we are to foster wisdom in the culture at large, it will have to be through wide-spread approaches such as the education system and practices such as meditation.

Caroline Bassett has contributed several fine reviews of the literature and in her present article she focuses on the link between wisdom and development. She uses several of the leading theories to view wisdom through their respective lenses. She synthesizes these and her own ideas in her emergent wisdom model.

Roger Walsh has had a long term interest in integral studies and more recently an interest in wisdom studies. One idea which lies at the heart of both topics is that perspectives – how and where we look at things from – are enormously important determinants of wellbeing, maturity, and wisdom. This article therefore focuses on perspectives, and the kinds of perspectives associated with wisdom and maturity.

Jonathan Reams has a long term interest in integral studies, as demonstrated by his editorship of this journal. However his interest in wisdom is more recent, and at this point I (JR) wish to say a few words to describe the impact of immersing myself in these the process of editing these articles and encountering the wisdom literature.

While the notion of cultivating wisdom has always been a part of my spiritual practice, it is only in the last few years that I have also encountered research in this field. Thus to me it was only natural to look for and be drawn to the less tangible aspects of wisdom, those facets not amenable to measurement. At the same time, I have found it interesting to see how researchers drew on the construct of wisdom in various ways in order to make it more tangible. I saw, as mentioned above, that bringing what has perennially been the domain of religion or contemplative practice into the academic domain has occupied modern researchers in a pursuit guided by the rules of engagement of their domain of inquiry. Thus the application of scientific method to the study of wisdom can be seen as an attempt to update, upgrade or extend wisdom into the modern world.

At the same time, I cannot help but feel a slight disappointment at the ways in which this move can get caught up in a reductionistic trap inherent in a central notion at the heart of method – the need to define the object of study. In this I note Rowson’s (2008) wrestling with this tension by saying that it might be the case that to define wisdom is unwise. I find this to be a healthy tension and one necessary to hold. We need to hold something in hand and mind in order to study wisdom, yet we constantly need to remember that that which we are holding is not wisdom itself.

Thus it appears to me that to get at the heart of a phenomenon or construct like wisdom requires an integral approach; integral in that it can integrate the religious, contemplative, spiritual or transrational dimension along with the rational, measureable and observable dimension. It should also be able to link with the practical domain of wise acting, enabling us to find modern ways to cultivate the wisdom we are clearly in need of today.

Encountering the works presented in this special issue through working with the authors on bringing their more extended research work into this format and audience and reflecting on the intersections, overlaps, diversities and insights they bring, I find myself holding a mixed feeling. On the one hand I know a lot more about how wisdom is understood today, as well as more about how it is not understood – it is not a direct equivalent of cognitive or ego stage development, even though we might not be able to help seeing some threads in common. From this, I have this urge to use this knowledge in service of acting in wiser ways in the world.

On the other hand I notice that there is much uncertainty about wisdom – the more one learns about a subject, the more s/he realizes how little they know about it. This uncertainty sits within me in a manner similar to the urge noted just above, but instead evoking a doubt that I could ever really know if my action is truly wise.

It is from this place of having gone through our own journeys in relation to wisdom that we invite you to encounter the offerings presented here. We have drawn these pieces together and guided them through the editorial process because we feel that they can contribute something to todays need for the jewel of wisdom.

Words from the Wise: Exploring the Lives, Qualities, and Opinions of Wisdom Exemplars

Drew Krafcik[1]

Abstract: The purpose of this research was to study exemplars of wisdom through a structured, theoretically grounded peer-nomination process. Twenty exemplars were given a variety of quantitative measures that included the Self-Assessed Wisdom Scale (SAWS), State-Trait Anxiety Inventory (STAI), Perceived Stress Scale (PSS-10), Spiritual Perspective Scale (SPS), Satisfaction With Life Scale (SWLS), Loyola Generativity Scale (LGS), Mindful Attention Awareness Scale (MAAS), Narcissistic Personality Inventory-16 (NPI-16), Humility Inventory (HI), Big Five Inventory (BFI), and the Washington University Sentence Completion Test (WUSCT). Exemplars also underwent lengthy semi-structured interviews to assess their lives, qualities, and understanding of wisdom. Interviews were analyzed for their significant themes. Results of this study suggest that exemplars of wisdom are humble, spiritual, mindful, insightful, tell the truth, and are open to experiences. They have meaningful, long-term relationships with mentors and loved ones. Exemplars are deeply influential in the lives of others and have very high life satisfaction. The 2 predominant definitions of wisdom given by exemplars were that wisdom is practical and comes from the unknown. Exemplars offered multiple strategies for the cultivation of wisdom-related processes, primarily the relationship with a mentor. Future research may clarify an emerging relationship between transcendent and practical wisdom.

Keywords: Exemplars, qualitative, quantitative, spirituality, wisdom.

Introduction

Would investigating people who are actually considered wise be helpful for the human enterprise? Might they offer reflections about life meaning and satisfaction that elude the rest of us? Could they provide both practical and theoretical insights into wisdom’s conception, cultivation, and potential to be learned and taught? What are their spiritual perspectives, generative offerings, and experiences of anxiety and stress? With few exceptions, the psychological investigation of wisdom has primarily focused on randomly selected people and their ideas on wisdom (Trowbridge, 2005, 2008).

[1] **Drew Krafcik, Ph.D**., is an assistant professor at St. Mary’s College of California. He is the Interim Coordinator of the Marriage and Family Therapy/Professional Clinical Counselor (MFT/PCC) specialization. Drew has worked professionally as a spiritual care coordinator and chaplain for hospice, as a counselor and mentor for adolescents and young adults, as the associate director of youth and family programs, and as a psychotherapist in community nonprofits and private practice. This paper is adapted from his dissertation: Words from the Wise: A Qualitative and Quantitative Study of Nominated Exemplars of Wisdom.
aek3@stmarys-ca.edu

SOME RIGHTS RESERVED

Echoing the sentiments of Aristotle (Robinson, 1990) and Abraham Maslow (1971), lifespan experts Lucinda Orwoll and Marion Perlmutter (1990) wrote, “To really know what wise people are like, you have to study them” (p. 174). Advancing this notion, the present research descriptively and empirically explored the lives, opinions, and wisdom-related characteristics of those who have purportedly excelled in its understanding.

Brief Context and Relevance

The modern empirical and theoretical study of wisdom is relatively young, as wisdom’s association with philosophy and the advent of behaviorism kept it from the realm of psychological inquiry until roughly 35 years ago. Researchers like Ardelt (1997), Baltes (1990), Clayton and Birren (1980), and Sternberg (1986) ushered in the modern era, introducing wisdom to the realm of psychological discourse. Since 1980, over 100 empirical studies have been undertaken, none of which have included exemplars, with the qualitative exception of Ahmadi (1998, 2000) and Thomas (1991).

More recently, philosophers and psychologists have spent decades trying to define the essence of wisdom, with the Arête Initiative at the University of Chicago (2008) providing a contemporary backdrop for this inquiry. Agreement seems to converge around wisdom being characterized as elusive, multidimensional, integrative, and oriented toward what is good, both individually and collectively. Prevailing psychological and theoretical models have enhanced wisdom conceptions through empirical measurement, the solicitation of implicit opinions, cross-cultural aggregations, developmental paradigms, and personality correlates. Personal components such as openness, insight, generativity, and spirituality have been related to wisdom, and exemplars offer the opportunity to explore and compare these associations. Mindfulness, spirituality, and humility offer particularly new investigations into the psychological study of wisdom, while anxiety, stress, and narcissism would seem to relate inversely.

Modern empirical research most relevant to exemplars demonstrates rudimentary efforts to seek out the wise through a variety of methodologies and inquiries. On the whole, a large proportion of empirical studies have focused on randomly chosen people’s conceptions, and no studies carried out thus far have included exemplars. Paraphrasing Orwoll and Perlmutter (1990), learning from wise people necessitates that we actually converse with them. Furthermore, studying and conversing with those who are purportedly wise is thought to contribute an increasingly material wisdom perspective to a theoretically based discipline.

More broadly, researchers (e.g., Sternberg, 2004) contend that the word wisdom “exists as an eternal witness of the hope that humans can make thoughtful, caring, and intelligent choices for the well-being of all whom they affect” (Trowbridge, 2005, p. 50). As some (Ardelt, 2000a; Orwoll & Perlmutter, 1990) claim that exemplars embody wisdom itself, it seems relevant to learn about their lives, garner their perspectives and reflections, and assess their characteristics.

Scholarly research into wisdom has yet to explore and assess exemplars, and they, and their perspectives, remain urgently needed. Trowbridge (2005) reflects, “The particular value of studying exemplars carefully is that they can show us the way to wisdom” (p. 248). While it seems more likely that multiple pathways exist toward wisdom's realization, the lives and opinions of exemplars are promising for the future of this inquiry.

Methodology: Approach, Rationale, and Assessment

Inspired by the suggestions of wisdom's psychological and empirical predecessors, contemporary scholars have given some guidance for carrying out a study of this type, calling it the exemplar and personological approach (Orwoll & Perlmutter, 1990; Trowbridge, 2005). The exemplar approach makes use of qualified nominators to identify persons who exemplify wisdom, and once selected, the personological approach recommends a collection of integrative data, including interviews, assessments, and surveys. While "validational support for peer nominations is still sparse in the study of wisdom" (Orwoll & Perlmutter, 1990, p. 167), precedence for this research strategy can be found in studies of persons with exceptional adjustment, ego development, and intelligence.

This combined methodology is particularly well suited for the current research when viewed from both theoretical and practical perspectives. First, this protocol provides a means of focusing explicit attention on people who are clustered at the upper end of the proposed wisdom continuum (Orwoll & Perlmutter, 1990). Second, it is based on the premise that wisdom can be better understood by the intensive study of those considered to be wise (Orwoll & Perlmutter, 1990). Finally, it contends that exceptionally wise people should provide insight into wisdom's nature, including the potential interrelationships among various correlates of wisdom; development, including events and life course processes contributing to wisdom; and consequences, including what it means to live a wise and meaningful life.

Employing Mixed Methods

Fittingly, to best fulfill the primary areas of investigation and actualize the methodologies set forth, I have instituted an integrative research design using both qualitative and quantitative approaches. Such interplay between qualitative and quantitative approaches was intended to expand documentation of the "elusive and subjective nature of the construct of wisdom and relate them to objectively assessed dimensions of wise people" (Lyster, 1996, p. 26).

Qualitative

The qualitative methods of in-depth semi-structured interviews and thematic analysis provided explorations into co-participants' lives, opinions, and wisdom-related qualities and characteristics. This course of investigation permitted me to potentially uncover otherwise inaccessible information by following up with emerging areas of interest with the interviewee (Braud & Anderson, 1998). Content analysis also allowed for the discovery of various layers of meaning through systematic identification (Braud & Anderson, 1998, p. 278) of both predetermined content areas and emergent themes.

Quantitative

Quantitative measures and questionnaires, including the Self-Assessed Wisdom Scale (SAWS), Perceived Stress Scale (PSS), Spiritual Perspective Scale (SPS), Loyola Generativity Scale (LGS), Satisfaction With Life Scale (SWLS), State-Trait Anxiety Inventory (STAI), Mindful Attention Awareness Scale (MAAS), Narcissistic Personality Inventory (NPI-16), Foundational Value Scale (FVS), Big Five Inventory (BFI), Humility Inventory (HI), and Washington University Sentence Completion Test (WUSCT) provided performance-based and empirical data about dimensions of wise persons. Converging information was then drawn on to assess the nomination validity of co-participants considered exemplars of wisdom, elucidate the nature of their wisdom, provide an empirical means to compare exemplars to the norm, and provide for an assessment of specific inter-correlations. As a side note, I considered the WUSCT a quantitative measure for this study because I was hypothesizing about the overall WUSCT average score, not utilizing the content of the open ended responses directly as data.

Exemplar Nominators

This research design utilized two groups of co-participants most suited for its purposes: exemplar nominators and exemplars of wisdom.

To address validity in the selection of exemplars, Orwoll and Perlmutter (1990) wrote, "Confidence in the nomination procedure can be enhanced with multiple nominators and particularly qualified nominators" (p. 167). While they provide no specific parameters regarding a nominator sample size, 15 were utilized within the current study. Moreover, these nominators fulfilled the particularly qualified exemplar proviso by being prescreened for the wisdom-facilitative criteria of the world's leading empirical researchers of wisdom, the Max Planck Institute (Ardelt, 2004a; Sternberg, 1998).

The wisdom-facilitative criterion emerged from Baltes and Staudinger's 1993 study and consists of a "background of and/or professional activity in areas we consider facilitative of the accumulation of wisdom-related knowledge" (p. 77). These areas include teaching, pastoral/ministerial counseling, and clinical psychology/counseling. Modern empirical research adds credence to both these findings and the current design rationale, as Staudinger et al. (1998) found that the greatest predictive factor for wisdom is profession, particularly within fields oriented toward the human condition. Additionally, in the Lyster (1996) study, wise nominees were disproportionately represented in human-service professions, particularly the advising professions of ministry, mental health, and education. Helson and Srivastava (2002) also found that a career in spiritual activity "added significantly to the prediction of wisdom" (p. 39).

Moreover, exemplar nominators were sought that have not just one but a convergence of these *wisdom-facilitative* experiences over the longest period of time (Montgomery et al., 2002). Baltes and Staudinger (1993) call this approach "age by experience" (p. 77), and theoretically, the current nominators, having had greater exposure to *wisdom-facilitative* experiences over time than the average person, were predicted to be more capable of articulating the nature of their wisdom and identifying it in others (Trowbridge, 2005).

Once selected, nominators were asked to identify between two and five exemplars of wisdom that they knew personally, identify the two wisest exemplars, and communicate their selections to me. If nominators believed themselves to be one of the two wisest exemplars, they were asked to include themselves. Nominators were invited to a) fill out a demographic questionnaire, b) complete a measure of wisdom characteristics (FVS) that seems to reflect the exemplars qualities, c) write a one-page description of why he or she is an exemplar of wisdom, and d) provide the context and length of time in relationship with the exemplar.

Exemplars of Wisdom

Wisdom exemplars consisted of 20 co-participants identified by the nominators and willing to take part in the study. I preferred no parameters for age, education level, gender, sex, religious orientation, marital/domestic partner status, socioeconomic status, or ethnicity. However, it was my inclination to conduct as many interviews as possible in person. Therefore, many participants resided in the San Francisco Bay Area and I traveled when necessary and possible.

Qualitative Assessment

The qualitative method employed was the in-depth semi-structured interviews. Twenty semi-structured interviews were conducted with the exemplar group. Questions were chosen that explored the lives, opinions of wisdom, and wisdom-related characteristics of co-participants. Questions were generally intended to be open-ended, allowing the co-participants to respond widely. The interview structure provided for the researcher to first, inquire first about co-participant lives; second, explore their wisdom-related characteristics, and finally, elicit their opinions of wisdom. The rationale for interviewing in this order was to avoid biasing co-participants by leading with explicit references to wisdom.

Sample interview questions included: What is your life like? How did you come to be the way you are? What are you doing for the common good? What are your values? What are your decision-making strategies? What are your spiritual perspectives? What concerns do you have, if any? How do you define wisdom? Can wisdom be learned? What personal and general components or conditions might facilitate its emergence and make it more accessible? Who do you consider to be wise?

Qualitative data from the current study was examined by performing a thematic analysis (Braun & Clarke, 2006). Each transcript was read at least three times upon its reception, and computer-assisted text analysis using MAXQDA (Verbi Software, 2007) was employed for coding and organizing the interviews. MAXQDA is used in a wide range of academic and non-academic disciplines, including sociology, political science, psychology, public health, anthropology, education, marketing, economics and urban planning (Hawes, 2006). Advantages include its flexibility, user friendliness, and highly advanced visualization for the processes of coding, memo writing, and browsing. An essentialist or realist approach was then taken which "reports experiences, meanings, and the reality of participants" (Braun & Clarke, 2006, p. 81). Theoretical, or pre-established areas of interest, and inductive methods or data driven themes were assessed.

In service of illuminating the lives and opinions of exemplars, I explored pre-established categories consistent with the interview questions/research areas as well as additional emergent themes. Emergent themes are defined as common patterns that were observed in the final analysis, but not derived from previous notions. In sum, the goal of the qualitative methodology was the emergence of a larger, more in-depth picture through a detailed description of categories, patterns, and themes for all co-participants included (Gross, 1995).

In order to operationalize this approach, the six-phase process of Braun and Clarke (2006) was employed. First, I became familiar with the data, including having the interviews transcribed, reading and re-reading the data, and noting initial ideas. Second, initial codes were generated across the entire data set based on intensity, density, and frequency. Third, codes were collated into themes, and themes were searched for and data relevant to each theme was gathered. Fourth, themes were reviewed and checked. Fifth, themes were named and defined, generating clear definitions and names for each theme. Finally, the report was produced with extract examples.

Advantages of the TA include its flexibility, accessibility to researchers with little or no experience of qualitative research, ability to highlight similarities and differences across the data set, capacity to generate unanticipated insights, and accessible results for the educated general public. Disadvantages included the difficulty of retaining a sense of continuity and contradiction through any one individual account.

Quantitative Assessment

The quantitative assessments are confirmatory and address multiple hypotheses related to assessing exemplar’s wisdom-related qualities and characteristics:

It was hypothesized that Exemplars’ average score on the Self-Assessed Wisdom Scale would exceed the cutoff score considered to be wise, 201.6.

Second, it was hypothesized that exemplars’ average scores on the Loyola Generativity Scale (LGS), Mindful Attention Awareness Scale (MAAS), Satisfaction with Life Scale (SWLS), Big Five Inventory (BFI) Openness to Experience, and Spiritual Perspective Scale (SPS) would exceed the normative mean scores for each measure by at least 10%.

Third, it was hypothesized that exemplars’ average scores on the State Trait Anxiety Inventory (STAI), Perceived Stress Scale (PSS-10), and Narcissistic Personality Inventory (NPI-16) would fall below the mean normative scores of each measure by at least 10%.

Fourth, it was hypothesized that exemplars’ average score on the WUSCT would exceed the highest conventional stage of adult development, the Achiever, 4.0.

Fifth, it was hypothesized that there would be statistically significant (p =.05) positive correlations between the Self-Assessed Wisdom Scale (SAWS) and: BFI Openness to Experience, Spiritual Perspective Scale (SPS), Mindful Attention Awareness Scale (MAAS), and Loyola Generativity Scale (LGS).

Key Summary of Findings

Demographics

The study was comprised of two samples, the exemplar group (*n* = 20) and nominator group (*n* = 15) group. Exemplars' average age was 69.5 years, approximately 10 years greater than the average nominator age. Nominators knew exemplars on average 25 years in multiple contexts, most often having exemplars as their colleagues and teachers. Exemplars were predominantly Caucasian, very well educated, and most were married or had a significant other. Nearly all reported having a current religious or spiritual tradition and practice.

Exemplars' Wisdom-Related Qualities and Characteristics

Self-Report Measures

The average exemplar score on the Self-Assessed Wisdom Scale exceeded the cutoff considered to be wise, consistent with the prediction. Exemplars' average scores on the Loyola Generativity Scale (LGS), Mindful Attention Awareness Scale (MAAS), Satisfaction with Life Scale (SWLS), Big Five Inventory (BFI) Openness to Experience, and Spiritual Perspective Scale (SPS) exceeded the normative mean scores for each measure by at least 10%, consistent with the prediction.

Exemplars' average scores on the State Trait Anxiety Inventory (STAI) and Perceived Stress Scale (PSS-10) fell below the mean normative scores of each measure by at least 10%, consistent with the prediction. Exemplars' average scores on the Narcissistic Personality Inventory (NPI-16) and STAI Trait-Anxiety did not fall below the mean normative scores of each measure by at least 10%, inconsistent with the prediction. Exemplars' average score on the WUSCT exceeded the highest conventional stage of adult development, the Achiever, 4.0, consistent with the prediction, although much more will be said about ego development and wisdom later in this paper.

Pearson Product-Moment Correlation Coefficient

There were found to be statistically significant positive correlations between the Self-Assessed Wisdom Scale (SAWS) and: BFI Openness to Experience, Spiritual Perspective Scale (SPS), and Humility Inventory (HI), consistent with the prediction. There were found to be positive, but not significant correlations between the Self-Assessed Wisdom Scale (SAWS) and: Mindful Attention Awareness Scale (MAAS) and Loyola Generativity Scale (LGS), inconsistent with the prediction. These results suggest that higher levels of wisdom were correlated with increases in openness, humility, and the importance of spirituality.

Qualitative Exemplar Wisdom-Related Qualities and Characteristics

Nominator Narratives and Exemplar Interviews

Six significant personal qualities were found in the nominator narratives about exemplars: honesty, compassion, spirituality, integration, understanding, and openness. Four core personal qualities were found in the semi-structured exemplar interviews: they tell the truth, are able to tolerate uncertainty, are grateful and appreciative, and are funny and lighthearted.

Foundational Value Scale

Exemplar qualities rated most highly by nominators on the Foundational Value Scale (FVS) were intelligence, having a sense of meaning and purpose, harmoniousness, and spirituality. The lowest scoring qualities were genius and being animated.

Exemplars' Lives

Nominator Narratives

Overall, nominators described exemplars as deeply engaged in life and meaningful relationships. This finding was evidenced by exemplars' personal impact on the nominators, painful life experiences, valuing helping others, being sought out for counsel, the validation of peers, and remaining in contact with their own experience.

Semi-Structured Interviews

Three core themes were uncovered through analysis in the semi-structured interviews about exemplars lives. First, exemplars reported deeply meaningful encounters and intimate connections with mentors and loved ones. Second, spirituality is important, as reflected in exemplars' beliefs and practices, including the unity of spirituality and life, practicing meditation, attending retreats, and having access to a reflective articulation process. Finally, exemplars are guides for others and have an impactful presence as luminaries, transformational catalysts, and teachers with specific means of sharing with others.

Exemplars' Opinions of Wisdom

Exemplars primarily defined wisdom as arising from the unknown and as practical. Some examples of wise behavior included connecting with another human being, restraining action, and making an important life decision without knowing why. Exemplars thought that people are wise about different things and nominated predominantly spiritual and religious figures as wise.

Exemplars' Ideas about How to Cultivate Wisdom

Exemplars offered multiple (technologies) strategies for the cultivation of wisdom-related processes, although there was disagreement about whether wisdom itself was teachable.

Mentors and Teachers

Ten of 20 (50%) exemplars spoke about (acquiring wisdom) wisdom-related acquisitions through mentors and teachers. Exemplars identified as important: role modeling and watching how mentors and teachers live, practicing what they are practicing, the consistency of relating, being helped to find your own way within, and cultivating deeper accessibility. Below are three examples:

> The best way to learn it is to hang out with wise people . . . You become wise when you spend time with somebody who has some wisdom. And just that consistency of relating for a period of time, you get to know how people think and how they respond and so forth. So that I think that it's a matter of finding the people that you admire and that you want to hang out with or work with. So that's how you pick it up. (EX 10)

> For me with my teachers, I would say it was a twofold process. One was kind of, in practicing what they were teaching, I began to see what they saw. And so I could appreciate the wisdom in them from the wisdom that was growing in me because they showed me how to see in a certain way. And then I realized, oh, that’s how they’re seeing. So that was, I think, one powerful appreciation of their wisdom. And the other was just in watching how they lived. You know, and it’s not to say, I mean, in many of my teachers it’s not that I didn’t see at certain times, you know, certain faults of things that I thought were not that skillful, but overall, I could really appreciate the wisdom of how they lived just in basically leading good lives, basically wise and compassionate lives. (EX 15)

> I think that a way wisdom is passed on is people find their path, or somehow discover their path, and there’s someone ahead of them that can see them on the path. And they say, “No, no, no, no. You're getting a little too far to the right. No, no, no, no. You're going too—a little too far to the left.” And that appears to be helpful . . . Then they’re doing whatever they’re doing . . . with – in their life with all the exigencies and suffering that they face. And through that combination wisdom can result. Not necessarily will, but can. (EX 20)

Let Wisdom Arise From a Larger Source

Eight of 20 (40%) exemplars talked about learning wisdom as a letting go, surrendering, and experiencing an incarnation from something larger than the individual. Examples that illustrate the theme are offered below:

> And that—and I guess that’s another argument for saying that wisdom is very much something that happens through you because so is love. It’s like when you can let yourself be completely open and let go of your own biases and your own conditioning and your own need to hold yourself together, then both of those qualities can spontaneously emerge. And I think the true gift of spiritual awakening is the emergence of both of those qualities, when they’re needed, or when there’s, you know, it’s not like you go around all the time feeling wise and loving. It’s just that life responds to as needed with those qualities spontaneously . . . Then beginning to trust what arises spontaneously. (EX 9)

No, I don’t think so. I think that simply the heart or spirit, if you want to use the Jungian term, the self in the larger “S.” has a wisdom. It’s amazing to me when I give up and let go what information comes to me; what direction I find to go. Say, a wise heart or movement inside of me that I have to constantly return to who, that gives me that. I don’t think you can teach it; it comes out of the, it comes out of the experience of surrender. But that’s a lifetime. (EX 17)

Being able to surrender is the number one attribute. Can you let go and get out of the way and surrender to something that's bigger than you? (EX 8)

And, in fact, the study we did was, in a way, teaching people to access wisdom, showing them a way that their consciousness could come up with an answer. (EX 14)

The disciplines of how one responds to and takes in, you know, the phenomenon of wisdom can be pointed to and taught and so forth. But it’s like can you really teach people to be wise? Can you really teach people to have a deeper inner sense of themselves? Can you really teach them that? And I don’t think you can. I think it’s a matter of learning how to open one’s self up to that. But you can teach the way to be aware and absorb, you know, the honoring of life and its wisdom. But it’s not a commodity. I guess that’s what I’m trying to say. It’s not a commodity you can teach. It’s something by the grace of life itself that can be incorporated but it’s not an achievement . . . It’s an incarnation. Not dissimilar from the Christian sense of incarnation of God and Jesus. So I really think it has a much broader metaphysical quality to it other than just the human accomplishment. And teach, I think, how one can receive it, but you can’t teach wisdom. Nobody ever truly has fully incorporated wisdom. It’s much bigger than the individual. (EX 11)

Could being wise be taught? Or having this experience of wisdom – I guess what would be more true for me would be the process, the cognitive and non-cognitive. So all the other ones, somatic and intuitive and, you know, getting information from other sources: emotional, body, psychic. The processes that would lead to that experience, the experience of wisdom, and then the subsequent urge to share. I think those can be cultivated, definitely. (EX 4)

Sometimes it is wise to trust how life is unfolding even when we do not a clue about what to do, or why we responded the way we did. Some movement wiser than us may be in charge. (EX 17)

This may go back to one of the things that I really trust and believe – that there is an unfolding wisdom that enfolds us beyond what we can create for ourselves. That life is beneficial to us in spite of all the anxieties and difficulties and frustrations and deprivations and all that stuff. And honoring both the consolations and the desolations, because they’re both meaningful. They both have their own way of evolving your life. (EX 11)

Getting Mind Out of the Way, Decentering From Primary Identity as Thinking

Six of 20 exemplars (30%) spoke about learning wisdom-related processes as facilitated by decentering from a primary self-identification with the thinking mind and cognitive processes. All six examples are provided below:

> A reduction in cognitive processes, so that you're not totally in your head, and more access to feelings and education of feelings. (EX 8)
>
> Another aspect is facilitating empathy and getting the conscious mind, not just thinking, not just sensate – getting the conscious mind out of the way and providing quiet time. It's the same sorts of things that you would think of in some kind of meditation or spiritual practice where you are getting the conditioned automatic reactions out of the way, out of the dominant way, so that any of those that are appropriate may be used, rather than ones that are overly conditioned. (EX 14)
>
> You can only point. You can only point to a way of holding something that's bigger than the mind. When you stop paying attention to your mind it stops being such a bother. When you stop taking it so seriously. When a thought comes through and you just look at it and say, whoa, that's interesting. Wonder where that one came from. But you don't buy into it and create a big story around it. Pretty soon that function stops functioning in the way it does when you really believe you are your thoughts. I think that most of the time we humans think we are our thoughts. (EX 9)
>
> Certainly, not conceptually. (EX 20)
>
> Also there are a myriad number of specific techniques and strategies from gently helping people recognize presuppositions; and then recognize them as presuppositions rather than as facts . . . then encouraging people to test those presuppositions. (EX 16)
>
> Let go. Get out of your head. Being in the head is a total detriment, a total detriment. Remember the mind is always looking for answers the soul already knows. (EX 8)

Motivation/Commitment/Investment and Doing the Work Ourselves

Five of 20 (25%) exemplars spoke about the relationship between motivation, commitment, and doing the work oneself as integral to the potential to learn wisdom-related processes. Five exemplars spoke about it this way:

> One of the most important things of all for learning wisdom is a commitment to doing so, the commitment to learning and understanding. (EX 16)
>
> A strong motivation. You can sit quietly for an hour and nothing happens, but if you go in with a motivation to say, "I want an answer to this. I want to know what's right for me," if you set an intention—and that's the word that we're using now – set an intention, then wisdom tends to be pulled into that magnetic direction. (EX 14)

> I think there are a few things. One of the things that has been my prime motivator over all these years is the quality of interest, just being interested in the mind, in suffering, in what causes it. And so in some ways, the truest meaning of the word philosophy, you know, kind of lover of wisdom, it's just that real interest in understanding I think is a very powerful force. What can motivate that interest can be different things. (EX 15)
>
> In order to make it a real living wisdom, then it has to be a methodology of training attention so that we can see things clearly for ourselves. And that is the whole methodology of the path. So it can be taught, but people need to do the work themselves. It can't be given. There's a famous line in the text about how the Buddhas only point the way, and everybody needs to walk the path for themselves. So the way can be pointed out, and the path of practice can be pointed out, but real wisdom develops only when we actually do the work. And it's the work of paying attention. (EX 15)
>
> And the thing that worried me the most about that is if somebody else knows and somebody else tells you, then you're always a receiver and you're never an actor. We really only learn through the things we do. (EX 13)

Learn From Experience/Reflection

Four of 20 exemplars (20%) spoke about acquiring wisdom as learning from experience and reflection, a kind of iteration process. Below are four illustrations:

> One acquires wisdom, in large part, by reflecting on experience. And so to teach wisdom involves helping people reflect on their experience. For many people, that means helping get in touch with their experience in the first place. Also there are a myriad number of specific techniques and strategies from gently helping people recognize presuppositions; and then recognize them as presuppositions rather than as facts . . . then encouraging people to test those presuppositions. (EX 16)
>
> There's a reflection component, there is an iteration of looking at something. Whether it's practical or spiritual within the self or outside the self, there is a reflection and an action and a refinement and a reflection and an action and, from what I know, it's called, you know, double-loop, triple-loop learning when you're going over and over. And then finally comes out something that is helping you overcome an obstacle, reach more joy in your life, solve a problem, practically create something that's going to help your entire tribe survive. That level of internal processing has to be in place. (EX 4)
>
> When I think about the people I've known through my life who are wise, I think I would conclude that they had a lot of life experience. It just didn't arrive with them in their genes. (EX 19)
>
> I think a person's ability to learn from experience. (EX 5)

Discussion: State and Stage Development and Transcendent and Practical Wisdom

The study prediction was that Exemplars' average score on the WUSCT would exceed the highest conventional stage of adult development, the Achiever, 4.0. Implicit in this prediction was the idea that wisdom and ego development were likely related and potentially positively correlated. Exemplars average score on the WUSCT was just above 4.0. This finding means that exemplars average score *technically* exceeded the Achiever stage of adult development, consistent with the prediction. Sixty percent of exemplars, however, scored in the conventional stages.

The professional WUSCT scorer, Terri O' Fallon, was uniquely qualified for this study because of her personal interest and ongoing research in late stage development, specifically the late-fifth person perspective (5/6) and the late-sixth person perspective (6+). When I mentioned surprise at exemplars' predominantly conventional scores, she replied:

> At first when I was doing the scoring, I was also so struck by this and didn't want to believe the scores I was getting. I did inter-rater reliability scoring with other people and they just didn't turn out very late for any of us. (T. O' Fallon, personal communication, December 4, 2009)

On the one hand, Cook-Greuter (1985) points out that highly developed individuals may score lower than their level of development. This problem stems from the fact that what Cook-Greuter calls the post conventional stages, 5-6, are post linguistic, while the WUSCT is based on language. This means that the WUSCT, effectively, is trying to evaluate the presence of higher-developmental stages with methods—those being language and writing—that are more commonly associated with lower-level developmental stages. To this point, O' Fallon writes "People at these later two levels not only need an abundance of responses, but they also need to have a variety of responses to different categories. It is very complex" (personal communication, December 4, 2009).

Reviewing exemplar scores on the State-Trait Anxiety Inventory (STAI), which preceded the WUSCT, exemplars were already "feeling strained," their highest State-Anxiety score, and "unrested," their highest Trait-Anxiety score. It is possible, therefore, that they did not say enough to score higher on the WUSCT due to feeling strained and tired, or tended to conceal their levels of development by giving short, simple answers to save time and energy. Comments from several exemplars at the end of the survey offered support to these perspectives. However, O' Fallon reflects, "We cannot guess what people mean . . . they have to delineate what they mean" (personal communication, December 4, 2009).

On the other hand, the above explanations for lower than expected WUSCT scores, while plausible, might also be relatively weak. If these scores are accurate, however, and wisdom exemplars are primarily situated at a conventional level of development, what meaning can be made of this? What do these development scores mean in relationship to wisdom – perhaps that later stage ego development is not necessarily correlated with wisdom and being/becoming wise?

Interestingly, the WUSCT correlations with the Self Assessed Wisdom Scale (SAWS) composite and all SAWS subscales were *not* significant. The WUSCT was only correlated significantly with one measure in the entire exemplar battery of tests, including all measure subscales. The positive and significant correlation of the WUSCT was with the Spiritual Perspective Scale (SPS). It is my opinion that reflecting on later *state stage* exemplar spiritual experiences could shed some light on the generally conventional ego development scores in relationship to wisdom.

Exemplar Spiritual States, Experiences, and Perspectives

One of the most compelling spiritual perspectives found to be important in the lives of nearly two thirds of exemplars, was an insight into, or an abiding recognition of, being a part of the whole of life, being a part of larger creation, or both:

> I just went into another whole level of recognition of my true nature I guess you would say. And it was like consciousness simply letting go of everything I am. And merging with everything that is. And I don't know. It was like a recognition of truth that I couldn't possibly ever deny again. (EX 9)

> What was striking about it was the understanding of the selfless nature of everything. The limitation of how we usually think of a sense of self as being the particular body we inhabit, you know, and being limited to that frame. That boundary fell away just afterwards. And it was just, there was more a, just a totality of experience rather than any one part of it being me. (EX 15)

> And finally it snapped you know . . . there isn't a spiritual and something else . . . It's the all of everything, nothing is left out. (EX 6)

Interestingly, the recognition of being part of larger creation was not just reflective of a small contingent of exemplars with Eastern religious and spiritual pedigree. Exemplars with Christian traditions and practices spoke similarly:

> If I have to articulate an image of God these days it's simply life. Yeah, simply life. And that life itself has its own way of being. And it is that way of being of our life that is the sacred ground. And we don't have to symbolize or image it in any other way to define it. (EX 11)

> The idea is that we really are part of this universe . . . And so you come to understand that our connectedness, that we are all, and all we are . . . is energy. I mean, that's enough, but that's what we are. (EX 5)

Critically, each of the above exemplars is an ordained spiritual teacher, so they could just be expressing beliefs or ideas associated with their traditions. An argument could also be made that exemplars' spiritual appointments add credence to their words. Levitt (1999) found consistently religious perspectives in her study of Buddhist monks, as did Ahmadi (1998, 2000) in her study of Sufis, which makes sense. Certainly, spiritual and religious perspectives are useful but they could be garnered from many sources, including sacred texts. Of more relevance is, are exemplars' words reflective of their lived reality, if only for a moment?

An honest assessment of exemplars' experiences of unity would likely require one's own capacity to see what is seen by exemplars. While I make no claims to a shared worldview, sitting and listening to exemplars offer their spiritual views felt like not just words and concepts but their own inner experiences. And being in their presence, for the most part, was opening in ways that were inspiring, motivating, and emotionally moving.

Obviously, my self-report does not validate exemplars' inner subjective life, nor do any of the measures in the study explicitly reflect it. Exemplars did score highly on humility and value truth telling; however. Le (2008a) also found that transcendent wisdom develops later in life than practical wisdom – and – developing transcendent wisdom later in life overlaps with exemplars average age, nearly 70. The significance of exemplars' spiritual insight warranted considering validity, because, if true, exemplars' recognition of being a part of the whole of life expands their identity beyond just humanness to "life, selflessness, energy, true nature, and the all of everything," to quote their words.

A second finding supportive of the recognition of being a part of all creation is found in exemplars' attendance of retreats. Exemplars' retreat experiences were often imbued with profound insights into a greater connection with life:

> That big shift, that transformative shift really happened when I did the 30-Day Ignatian Retreat, which was 11 years ago, but it's still as fresh as can be. I really move back into those states, although I've moved way beyond who I was at that point. But It really had to do with that awareness that came to me during that retreat; that all this "driven-ness" to make my life meaningful kind of got spoken to by an inner voice that emerged of saying, "Remember, J, that I gave you your meaning at your birth." And that awareness was so transformative that it just lifted that anxiety burden of driving myself to make myself meaningful to either myself or the people around me. And allowed me to relax a bit. And it re-contextualized my life in terms of the "driven-ness" to be somebody, rather than simply internally affirm the being that I am. And I think that transition not only brought a lot of relief but, you know, reframed a sense of myself, but then also began to reframe how I experience things in the world, how I experienced other people. You know, so much of my work now is encouraging people simply to be who they are rather than striving so hard to be somebody else. (EX 11)

> When I was in my late 30s, I was in a retreat for 5 days just with myself in silence in a house over the ocean in Big Sur. I guess the story I would relate that could kind of help you or anyone kind of understand in words what happened, because it's very difficult for me, is you hear people talking about some sort of moment or experience, mystical experience, where they feel reborn. Where you have this, it's almost like a wiping out of who you were, and an emergence of someone that even to yourself, you're like, "I didn't used to be like this." And it happens very fast, within moments of something very profound that you experience. I spent many hours of that retreat laying on a towel in the grass staring up at the sun – just like when I was a little kid – outside of this house in Big

> Sur. That was a common link with being as a child as I was, I was down in the grass connected to the Earth and looking up at the sun and experiencing that kind of energy of nature. So that experience, I literally, it was like somebody reset my soul. (EX 4)

Retreats could certainly mean multiple things to exemplars: a time and place of respite and reprieve from interpersonal engagement, especially considering that exemplars are generative, work in professions oriented to the human condition, are married, and most have children. Exemplars' highest trait anxiety item was being "tired," and one of their highest items on the Loyola Generativity Scale (LGS) was, "Other people say that I am a very productive person."

Retreats could also be a means by which exemplars revisit their vocations more deeply and specifically. Retreats could be places to have dedicated spiritual practice, as was mentioned by some exemplars (e.g., EX 11 and EX 16). They could be places to experience silence, or be near mentors and teachers. Retreats could also be containers, or holding environments, for letting go of the routines of daily living and being present in a sustained way to one's inner life.

A third finding potentially related to exemplars being part of larger creation was their second-most-frequently described method for learning wisdom: allowing wisdom to arise from a larger source, and learning access to that source:

> And that – and I guess that's another argument for saying that wisdom is very much something that happens through you because so is love. It's like when you can let yourself be completely open and let go of your own biases and your own conditioning and your own need to hold yourself together, then both of those qualities can spontaneously emerge. And I think the true gift of spiritual awakening is the emergence of both of those qualities, when they're needed, or when there's, you know, it's not like you go around all the time feeling wise and loving. It's just that life responds to as needed with those qualities spontaneously . . . Then beginning to trust what arises spontaneously. (EX 9)

> I think that simply the heart or spirit, if you want to use the Jungian term, the self in the larger "S," has a wisdom. It's amazing to me when I give up and let go what information comes to me; what direction I find to go. Say, a wise heart or movement inside of me that I have to constantly return to who, that gives me that. I don't think you can teach it; it comes out of the, it comes out of the experience of surrender. But that's a lifetime. (EX 17)

> I think it's a matter of learning how to open one's self up to that. But you can teach the way to be aware and absorb, you know, the honoring of life and its wisdom. But it's not a commodity. I guess that's what I'm trying to say. It's not a commodity you can teach. It's something by the grace of life itself that can be incorporated but it's not an achievement . . . It's an incarnation. Not dissimilar from the Christian sense of incarnation of God and Jesus. So I really think it has a much broader metaphysical quality to it other than just the human accomplishment. (EX 11)

The significance of identifying oneself as non-separate from life resonates with several wisdom conceptions in the psychological literature. McKee and Barber's (1999) notion of wisdom as "seeing through illusion" (p. 151) comes to mind, as does wisdom as insight based into the meaning of life (e.g., Ardelt, 2000a; Kekes, 1995). Achenbaum (2004) writes: "the wise, utilizing their abilities to look upon the universe from several planes, seek insights about how their true nature evolves within themselves" (p. 46). Wisdom as "profound insight into reality" seems possible (Trowbridge, 2007, Cultivating a Wisdom Perspective, para. 3). The transcendent wisdom notion of Le (2008b) also might apply: attainment of insight into reality. From Levitt's (1999) study of Buddhist monks: "Learning the true nature of reality is both a final goal and part of developing wisdom" (p. 104). Ahmadi (1998) points out that in her study of Sufis, the individual self is not in fact separated from other than self. Trowbridge's (2008) reference to the wisdom of the sages: To truly know yourself is to know all things. The point is, being one with all of creation is significant because it might be related to Sophia, "which is knowledge first of things, ultimate explanations and what follows from them, particularly in regard to human fulfillment" (Trowbridge, 2008, p. 44). Recognizing the communion of all life would certainly seem to be related to what follows regarding relative human fulfillment.

Perhaps then, exemplars' speaking about a connection to oneness, or the whole of life, *is suggestive of transcendent wisdom*, although the psychological wisdom-related definitions of transcendent wisdom are, for the most part, not descriptive enough. What is meant by spiritual insight, or by perceiving reality? What does it mean that wisdom is potentially related to state spiritual development? Is wisdom its own particular lines (e.g., transcendent, practical) of development or the highest levels of multiple lines of development (Wilber, 2000)? Is self-development seemingly not necessary for *access* to certain types of wisdom, but is self development/transcendence/awareness part of expressing wisdom cleanly? Perhaps state spirituality relates to perceiving reality, and self-development to interpreting and enacting what is realized in the world?

In general, the psychological wisdom-related research considers transcendent wisdom transpersonal and practical wisdom interpersonal. But what if transcendent and practical wisdom were *related in some way*? Certainly, it is one thing to *perceive* reality and quite another to *act* in accordance with that insight, or from that insight on a consistent basis. This potential connection between transcendent and practical wisdom is a very rare inquiry in the psychological wisdom literature of the past 35 years, with the exception of Aldwin (2009).

In our correspondence during the study, Terri O' Fallon (personal communication, December 3, 2009) reflected on the relationship between state spirituality, stage development, and wisdom:

> Many people have a wonderful spiritual life that makes them very, very wise, but it doesn't mean that they are late developmentally. I have scored people that many have assumed were later level in their development and they tended mostly to be late in their state stages. For example, they may not be able to see a long way out in time, or have a wide universal space field they live in. They may not be able to see general systems, and they may not be able to see certain aspects of polar opposites. They may not be able to see the construction of reality, or certain kinds of projections in the moment. None of these things are needed to be seen as very wise.

> I realized that development has little to do with intelligence and for the most part, wisdom. So I had to have a meaning-making scheme that helped me understand this, and developed this model:

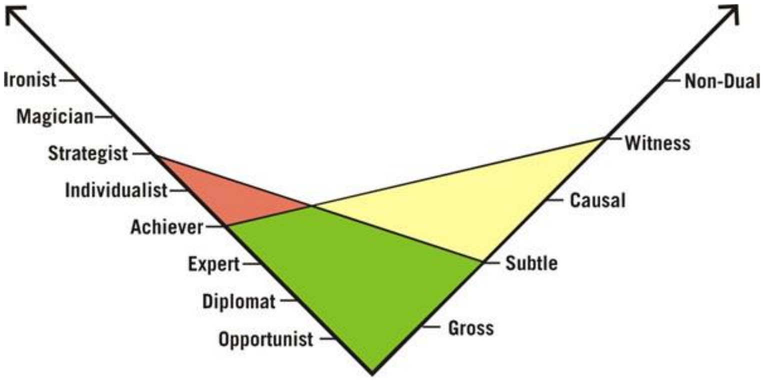

Figure 1. O'Fallon developmental model.

> On the right side is the state stages in this V. On the left side are the developmental stages which I scored for you. If you draw a line from the developmental stage someone scores at, to the state (spiritual wisdom) stage they embody you can see that you can have an Achiever that has a triangular space (I call it "consciousness room to roam") that is actually larger than the developmentally later Strategist, who has less wisdom!
>
> I ran into this a number of times in the teaching I have been doing. Some people were incredibly wise even though they didn't have some of the developmental capacities of a later level. In this case, the Achiever has a yellow space to roam in that the Strategist doesn't have and the Strategist has the red space to roam in that the Achiever doesn't have.
>
> (Ego) development doesn't necessarily measure wisdom. At the very latest stages wisdom does occur because you can't get there without later states but this isn't true for most levels.

O' Fallon (See Figure 1) seems to be suggesting that state spiritual development eclipses personal development when it comes to *accessing* wisdom, but what about *expressing* wisdom? Perhaps wisdom (transcendent) comes through (permeates) the state side of development and is implemented through, or in, the context of the stage side of development, which might account for wisdom being defined by exemplars as coming from the unknown and yet practical. Perhaps this perspective could also give credence to the idea of varying developmental *stage or type* expressions of wisdom, although the *source* from which wisdom arose was the same and was applied to the same context. In essence, individuals have access to wisdom, but they are not wisdom itself, and thus wisdom is theorized to develop through multiple pathways that work together synergistically (Baltes & Staudinger, 2000).

O' Fallon's (2009) thinking that personal (ego) development is not necessarily related to wisdom is also congruent with the finding that exemplars are wise in different ways (e.g., lines), and that their particular personalities (e.g., types) are not shed for wisdom to be present. Nor are exemplars' relative life experiences and knowledge:

> I think of exemplars of wisdom, I think that they're a variety of different personalities that can be wise. And the other thing is I think people may be wise in different ways in different areas. Some people can be very wise in one area and not so wise in other areas. I don't expect that somebody, just because they're a teacher, for example, spiritual teacher, they may have a lot of wisdom in one area and none at all in other areas. And I think that that can be so disillusioning when somebody puts a teacher up on a pedestal and then they turn out to be less than perfect. And they always do, because we're all just human. So I wouldn't hang it on any particular quality except the sense of caring and respect. (EX 10)

And yet exemplars said:

> When wisdom is being spoken, it's egoless, or wisdom is being demonstrated, there's nobody there intruding, in that sense. But there is a way somehow – and it may be different moment to moment. But I think when it shows up that there's a feeling. There's a sense of presence that something bigger than what's human is on board and it needs to be honored or listened to, or be servants to that. (EX 6)

Of relevance, perhaps, is what Levitt (1999) highlighted in her study as the main difference between the Tibetan Buddhist process of self-development and Western psychotherapeutic practices: the one puts forth the unreality of the individual self, and the other seeks a deeper understanding of this individual self – "Ego abandonment and ego strengthening" (p. 102). Trowbridge (2008) points out that Levitt (1999) suggests that psychotherapy and Buddhist philosophy "may be methods, grounded in the metaphysics of their cultures, to develop wisdom" (1999, p. 103).

In the psychological wisdom literature, ego strengthening and ego abandonment is generally separated as self-development and self-transcendence, respectively (Ardelt, 2003; Le, 2008b). Less spoken about, however, in this literature, is the possibility of developing awareness of a self that can then possibly be transcended and included.

One of the only theoretical and practical wisdom conceptions to consider a connection between developing a self and transcending the self is Robins (1998):

> Wisdom is related not just to the expectations, beliefs and the consequent emotional reactions resulting from beliefs, but also to the cognitive, behavioral, physiological, interpersonal, familial and social components that originate from and contribute to beliefs, all of which intimately and dynamically interact and thus co-evolve together across our adult development. In addition to the development and treatment of the ego, and consistent with Buddhist Psychology (Epstein, 1995), Wisdom Therapy simultaneously aims to facilitate the transcendence of the ego. (Wisdom Therapy Institute, Goals, para. 1)

Importantly, a high percentage of exemplars in this study have Western psychotherapeutic training and experience, which is often concerned with self and other development. Many exemplars also have longstanding Eastern spiritual traditions and practices, often associated with self-transcendence. The relationship between self-awareness and self-transcendence seems significant in discussing the relationship between stage development, state spirituality, and wisdom, and will be explored briefly. A critical limitation in is this discussion, however, is that “self” and “ego” are not precisely differentiated in the study by exemplars (e.g., the separate ego/self-sense and the “egoic” organizing function).

Self-Awareness and Self-Transcendence

In the psychological wisdom-related literature, developing a capacity for self-awareness and self-transcendence seems related to the reflective component of Ardelt’s (2004a) model of wisdom: self-awareness, self-insight, self-examination, and the capacity to take multiple perspectives of phenomena (Ardelt, 2004a). Ardelt contends this self-reflection practice informs an undistorted comprehension of reality by facilitating an awareness and transcendence of one’s projections and subjectivity.

Le (2008a) also spoke of wisdom as transcending the biases, subjectivity, and self-centeredness that are natural and pervasive in humans. She contends that wisdom is a developmental process that involves self-transcendence.

There are multiple findings in this study that relate to exemplars self-awareness and self-transcending capacities.

Mindful Attention Awareness Scale (MAAS)

Exemplars’ higher than normative mindfulness scores on the MAAS is supportive of self-awareness and self-transcendence. The MAAS assesses a core characteristic of dispositional mindfulness—namely, open or receptive awareness of and attention to what is taking place in the present. Kabat-Zinn (1990) claimed this kind of attention nurtures greater awareness, clarity, and acceptance of present-moment reality. This finding is significant for two reasons. First, it suggests exemplars strong valuation of receptive awareness to what is taking place in the present moment. And second, it seems that attending to what is actually happening in the present moment would precede the capacity to respond intimately to it, or to transcend it.

On the MAAS, however, high scores offer little insight into exemplars’ subjectivity, especially because the stems are negatively worded. Mindfulness also has not been studied in the psychological wisdom-related research, so a degree of reservation in my meaning making is prudent.

Valuation of Self-Awareness and Self-Contact

Another finding supporting self-awareness and self-transcending capacities is exemplars’ valuation of self-awareness and self-contact. Sixty percent of exemplars reported tracking sensations, creating spaciousness around emotions, witnessing thoughts, and staying in touch with moment-to-moment arisings. This finding offers insight into exemplars’ subjective notions of mindfulness, mentioned earlier, and is thought to contribute to a clearer view of subjectivity and the minimization of projection:

> Well, I think it's the gradual strengthening of the faculty of awareness, you know, and self-awareness so that just over the years I've become kind of increasingly mindful of just the different patterns that are going on in my mind in thoughts and emotions. And through the seeing of them more clearly, it becomes easier to, at least a good part of the time, certainly not all the time, but a good part of the time, choosing to act on those that bring about well being and letting those go that seem to bring about suffering. So it all comes out of awareness and self-awareness. (EX 15)
>
> I'm experiencing everything from the pressure of one leg on another, to a background feeling of pleasure, to pure awareness witnessing the same, witnessing it. And everything in between. It's interesting. I'm just watching the mental process of responding to this. It's like there's a boundless array of perspectives and possibilities. So it's a process of either selecting for any number of reasons one particular perspective or sitting back and allowing some aphoristic response, almost poetic response to attempt to encapsulate the many dimensions. (EX 16)
>
> The other thing that's meaningful for me is just trying to stay in contact with what's happening to me. What am I experiencing? Kind of trying to refer back to that and check in with it. Then also just allowing myself time to process whatever's going on [pauses], and to try to give it some spaciousness [pauses], and see what's really going on. (EX 20)

Meditative Practices

A third related finding to exemplars' development of self-awareness and self-transcendence is the high prevalence and importance of exemplars' meditative practices. Twelve exemplars (60%) cited practicing various types of meditation, and within that group, eight practiced meditation for 25 years or more. Fifty percent of the total exemplar group also reported having multiple spiritual practices.

Without exemplars clearly defining what is meant by meditation, however, it is hard to speak uniformly to its effects. One exemplar said of meditation, "it increasingly gives you access to lots of inner processes, inner spiritual processes" (EX 11), while others commented on the value of meditation in their lives for focusing, as an awareness practice, and for emotional regulation. Other potential reasons for the high prevalence of meditation could be the age related overlap with a natural time of contemplation in life as well as exemplars' religious and spiritual affiliations.

Combined Qualities

A fourth finding potentially related to exemplars' self-awareness and self-transcending capacities is their combined qualities of openness to experience, humility, and low state and trait anxiety. Exemplars scored highly on openness to experience and humility, both of which were correlated significantly and positively with wisdom. Exemplars also scored lower than the norm on state and trait anxiety.

Openness to experience was defined, in part, as avoiding narrow-mindedness and self-deception (Webster, 2007). Humility was defined as a non-defensive willingness to see the self accurately, including strengths and limitations (Exline, 1999). The lowest-scoring item on the humility scale was, “I feel slighted when I don’t get the attention I should,” suggesting exemplars have some degree of freedom from other-oriented self-esteem, or at least value it. In relationship to others, exemplars’ freedom from needing to have their self-esteem enhanced by others is significant, as it allows the possibility of exemplars seeing beyond their own needs, and potentially being free to receive someone else.

Regarding state and trait anxiety, in situations where relationships are involved, self-esteem is challenged, or failure is experienced, people with high trait anxiety tend to react with higher levels of state anxiety. Implied in this previous reaction is that high trait-anxiety people may have a fairly rigid internalized self-concept as compared to someone whose self-concept is supple/fluid enough to accommodate being inadequate, failing, or looking bad (Butlein, 2005). Perhaps exemplars’ openness to experience, a humble, non-defensive willingness to see the self accurately, and low trait and state anxiety combined to allow a less guarded, more transparent or fluid self-concept, resulting in reduced self-centeredness and projection. The result is more presence and availability to themselves and others.

Wisdom-Related Strategies

A fifth finding relating to exemplars’ self-awareness and self-transcending capacities is exemplars’ strategies, or technologies, for learning wisdom-related information. The third-most-reported theme for learning wisdom-related material, behind mentors and letting wisdom arise, was “decentering” attention from the thinking mind, suggesting a larger source than just the individual is responsible for the genesis of wisdom:

> You can only point. You can only point to a way of holding something that’s bigger than the mind. When you stop paying attention to your mind it stops being such a bother. When you stop taking it so seriously. When a thought comes through and you just look at it and say, whoa, that’s interesting. Wonder where that one came from. But you don’t buy into it and create a big story around it. Pretty soon that function stops functioning in the way it does when you really believe you are your thoughts. I think that most of the time we humans think we are our thoughts. (EX 9)

Overall, that exemplars could both develop awareness of a self and potentially transcend the developed self is significant. First, it would seem to give exemplars access to their own relative development as human beings. Relative awareness is important in cultivating freedom from self-centeredness, projections, and subjectivity, offering increased presence to oneself, others, and the world.

Second, self-awareness and self-transcendence would seem to make more likely the capacity for exemplars to relatively embody, or live day to day, their arising insight of being one with the all of creation. In this way, perhaps exemplar's particular personalities and relative stage development are like a prism through which wisdom passes, potentially clarifying or muddling wisdom's enactment in a context. By becoming aware of the relative stage related interpretive lens of what is realized, exemplars can translate and impart the insight as clearly as possible into the world.

Summary: Some Meaning Making and Integration

In the closing moments of my interview with Exemplar 2, he likened religious traditions to the Chinese lantern, a metaphor that has since become a (meta) perspective reflective of my understanding and discussion of wisdom exemplars:

> Think of religious traditions as an eight-sided Chinese lantern and in the middle, there's a candle. You don't know where the light comes from but the light is filtered through those various colors of glass. All those colors of glass, all those pieces of glass are manmade. They distort the light. Now, there are a few that are more transparent than others . . . But all major religions are just like those glass in the lantern. What's the light? You don't know what it is. That's where you come to your mystery again. But you are perfectly free to assess any human construction of any kind once you know about it, once you learn about it. But you have to learn about all of the glass, not just the one. You see? (EX 2)

Perhaps exemplars are akin to the stained glass in the eight-sided lantern, and in the middle is the light of wisdom. For multiple reasons found in this research, exemplars are able to filter the light of wisdom (from a state accessed source) through their humanity into the world with less distortion and more transparency than the average human being.

Exemplar Connection to Source, Ground, or Spirit

Like the inner sides of the glass, exemplars have cultivated, or have been graced with a (state based) receptivity to the source and radiance of wisdom, whatever wisdom is. Exemplars' longstanding practices of meditation, valuation of mindfulness, and attending retreats; relationships with mentors; and long term-experience with multiple religious traditions and spiritual practices are all thought to be related to this capacity to access wisdom.

Exemplars' notions of wisdom also support a receptive element of wisdom. Forty percent of exemplars talked about learning wisdom as a letting go, surrendering, and experiencing an incarnation from something larger than the individual. Wisdom was also defined by exemplars as coming from the unknown, and *access* to wisdom can be pointed to and cultivated:

> Wisdom is something by the grace of life itself that can be incorporated but it's not an achievement . . . It's an incarnation. Not dissimilar from the Christian sense of incarnation of God and Jesus. So I really think it has a much broader metaphysical quality to it other than just the human accomplishment. And teach, I think, how one can receive it, but you can't teach wisdom. Nobody ever truly has fully incorporated wisdom. It's much bigger than the individual. (EX 11)

> For me (wisdom) is what arises when I admit that I really don't know anything. It's like something that comes spontaneously from being willing to sit in the not knowing. And having no personal agenda. So that whatever movement happens is happening almost through you rather than from you. It's being willing not to be attached to your ideas. It doesn't mean that what you know or you've learned or you've experienced isn't useful, because in a way that, for me, that integrates with this other kind of intuitive knowing. But it's sort of like letting the flow arise rather than going at it from an analytical perspective or a memory perspective. I don't know. I guess I think of wisdom as kind of a universal quality that pops up once in awhile in anybody. And it's coming from some other source in a way. So it plays through us when we're not overly involved in our concerns. (EX 9)

Exemplars' recognition of wisdom as incarnational, or coming from another source, is similar to the notions of transcendent wisdom put forth in previous literature. Transcendent wisdom is associated with "interest and skill in the transpersonal domain" (Wink & Helson, 1997, p. 12) insight into reality (Le 2008b, Trowbridge (2008); seeing through illusion, wisdom as a priori, or derived from intuitive insight (Barber & Mckee, 1999); and transcending the personal, is insightful, and demonstrates spiritual depth (Wink & Dillon, 2002). Transcendent wisdom could also be part of what Trowbridge (2008) refers to in his sense of one's ability to perceive reality, reflected in Exemplar 9:

> What it does is it ends the seeker when you recognize the truth. It just eliminates that. You realize you're not there. There's nobody really there. There's only a set of experiences. And that you are this – that what I am and what you are, there's absolutely no difference at the core. Every living thing is the same thing. It also eliminates any tendency to think that you're different than anyone else because everyone else is this too. It's just totally obvious. And so it just kind of ends the journey. (EX9)

Spirituality is thought to be related to this insight. Sixty-five percent of exemplars spoke about the spiritual as being inseparable from the wholeness of life, and the same percentage of exemplars expressed having a reflective articulation process though which they have access to an intuitive awareness out of which come creative and spontaneous images, words, and concepts relevant to their current context.

Almost all exemplars valued the importance of spirituality in their life as measured by the Spiritual Perspective Scale (SPS), which was also positively and significantly correlated with wisdom. The highest stem on the SPS was, "Spirituality has played an important role in my life." Eighty-five percent of exemplars reported having a current religious or spiritual tradition; 80% had spiritual practices; 50% have more than one spiritual practice; and 55% attended retreats.

Relative, Reflective Self-Awareness

The lantern glass itself is conceived of as exemplars' relative stage development and conditioned identity. Exemplars' valuation of, and capacity for, self-awareness and self-reflection is thought to relate to an awareness of their own self-knowledge and development. To varying degrees, exemplars are able to see and assess within themselves their own human, cultural, developmental obstacles to clear and continuous/ or abiding access to source. Metaphorically, this increasing self-transparency and permeability allows light to flow from the inside of the lantern out through the glass with minimal distortion.

This capacity for self-awareness is similar to the Le and Levenson (2005) conceptualization of self-transcendence, or "the ability to move beyond self-centered consciousness and to see things as they are with clear awareness of human nature and human problems, and with a considerable measure of freedom from biological and social conditioning" (2005, p. 444).

The capacity of exemplars to mindfully witness and potentially facilitate their own development (moment-to-moment experiences) is also similar to the reflective component of Ardelt's (2004a) model of wisdom: self-awareness, self-insight, self-examination, and the capacity to take multiple perspectives of phenomena (Ardelt, 2004a). This self-reflection practice informs an undistorted comprehension of reality by facilitating an awareness and transcendence of one's projections and subjectivity.

Related present study findings include: exemplars' valuation of self-contact and self-awareness, higher than normative mindfulness scores; learning wisdom as decentering from thinking; technologies for learning wisdom as ego-deconstructive; high resonance with the Humility Inventory; and lower than normative state and trait anxiety. The fact that many exemplars are psychotherapists or counselors points to the direct engagement of exemplars with professions oriented to the human condition, many of which are related to developing self-knowledge. Exemplars being predominantly psychotherapists and counselors may also reflect the professional community from which nominators were found.

Conscious Expression

The outer edge of the lantern glass is conceived of as exemplars' conscious relationship with others and with the world. Exemplars' interpersonal relationships likely align with what the psychological wisdom literature considers practical wisdom. Practical wisdom was defined as skill and interest in the interpersonal domain (Wink & Helson, 1997), facilitating the optimal development of self and others (Webster, 2007), living a good life in society (Le, 2008b) and the ability to make good choices regarding human affairs (Trowbridge, 2008).

The high importance and prevalence of exemplars' loving relationships, valuation of truth-telling, higher than normative generativity scores, multiple avenues of generativity, deep connections with others, being sought out for counsel, and roles as educators, therapists, and spiritual teachers all are supportive findings.

Conclusion

When there is some degree of development/accessibility for exemplars in all three areas – (a) spiritual insight (transcendent wisdom): or a deep receptive potential to or recognition as (and as) the unknown source of light; (b) self-awareness/ self-knowledge/ self-transcendence or an awareness of relative humanness; and (c) conscious engagement, or interpersonal accessibility in relationships/contexts (practical wisdom) – wisdom can flow through and permeate exemplars' humanness, responding to the arising contexts of life with minimal distortion.

Exemplars' reflective articulation process, acting in the world as luminaries and visionaries, making life decisions intuitively, and experiencing oneness with all of life seem reflective of this connection between transcendent and practical wisdom, embodied through exemplars, understood through the use of the lantern metaphor. Ultimately, exemplars – momentarily, or, perhaps, in an abiding way – seem to become aware as, and of, both their immanence (humanity) and transcendence (divinity), such that both impact the world with practicality.

While the spiritual perspectives reflective in the findings of the study place the current research in the minority of psychological wisdom-related research of the last 35 years, it is worth noting the observations of Trowbridge (2008):

1. The divine, religious aspects of wisdom have been mainly ignored by psychologists.
2. Wisdom cannot separate itself from religion or questions of ultimate meaning, so long as what is wise is connected with judgments regarding what is best for men and women.
3. The traditional understanding of wisdom cannot be simply accepted.

Final Thoughts

What seems most important about wisdom is that it is alive. It is not a prescription. It can use multiple pathways of knowing. It arises from things we already know and will birth insights that otherwise would never come, in response to the unique context we are in. We will both feel out of the way and deeply intimate in relationship. Wisdom reveals the truth of the moment, but is not necessarily validated in a moment of understanding.

Wisdom is paradoxical. It requires doing and being, is meditative and generative. Wisdom arises both alone and in communion.

Perhaps, then, wisdom is expressed, or is translated, through many personal developmental lenses. Whatever developmental perspective is interpreting and enacting wisdom, recognizing when one is speaking from a personal place versus allowing wisdom to use the personal, is incredibly useful. But maybe that recognition is not necessary at all, or is in itself part of development, accessible and useful in some contexts and not in others. Ultimately, perhaps the word wisdom is just another referent to a process, a capacity that must be lived in order to be alive.

Constructive-Developmental Theory and the Integrated Domains of Wisdom: Are Post-Conventional Leaders Really Wiser?

Sharon L. Spano[1]

Abstract: How leaders experience wisdom is important to our understanding of leadership behavior as well as to our overall understanding of leadership. The article explores qualitative findings that may advance academic discourse and research at the intersection between leadership, wisdom, and constructive-developmental theory. The present study examined how 12 executive leaders who assessed at the conventional and post-conventional stages of adult development experience wisdom. It is significant in that it addresses a gap in the literature between wisdom and constructive-developmental theory. Semi-structured interviews were conducted to determine how executive leaders understand their leadership role in terms of the cognitive, reflective, and affective domains of wisdom. Contrary to research that defines and operationalizes wisdom as the integration of these domains, findings indicate that participants experience wisdom in one or more of the domains of wisdom. Participants were also assessed for their meaning-making capacity to determine their stage of development using the SCTi-Map instrument. Contrary to research in constructive-developmental theory that suggests that post-conventional levels of development may equate to higher levels of wisdom, findings also indicate that there was no significant difference between how leaders describe their propensity for wisdom and their measured adult stage of development. Leaders who assessed at both the conventional and post-conventional stages of development described a propensity for wisdom. Analysis of participant responses suggests that the wisdom, in all its complexity, has its own trajectory and therefore necessitates inquiry into the lines of human development to include integral perspectives associated with spiritual, emotional, and psychosocial measures. The results of this study indicate the potential for additional research that explores wisdom in the context of both adult lines *and* adult stages of development to determine if specific correlations do exist.

Keywords: Constructive-developmental theory, human development, leadership, stages of development, wisdom.

Introduction

Wisdom is an important construct for effectively dealing with the complexities of our modern society (McKenna, Rooney, & Boal, 2009). It is also considered an essential element of outstanding leadership (Rowley, 2006; Sternberg, 2007; Yang, 2011). Constructive-developmental theory is a useful construct in broadening our understanding of the meaning-making systems of leaders (Cook-Grueter, 1999; Torbert & Associates, 2004) and how they may experience wisdom.

While there has been extensive research in wisdom theory as well as the intersection between adult development and leadership, there has been little research that explores the direct linkage between wisdom, constructive-developmental theory, and leadership. The present study examines how 12 executive leaders who assessed at the conventional and post-conventional stages of adult development experience wisdom. It is significant in that it addresses a gap in the literature between wisdom and constructive-developmental theory.

Semi-structured interviews were conducted to determine how executive leaders understand their leadership role in terms of the cognitive, reflective, and affective domains of wisdom (Ardelt, 2000, 2003, 2004a; Clayton & Birren, 1980). Contrary to research that defines and operationalizes wisdom as the integration of these domains (Ardelt, 2003, 2004a), the results of this study indicate that participants experience wisdom in one or more of the above domains; the integration of all three domains was not always present.

Participants were also assessed for their meaning-making capacity to determine their stage of adult development using the SCTi-Map instrument (Cook-Greuter & Associates, 2008). Contrary to research in constructive-developmental theory that suggests that post-conventional levels of development may equate to higher levels of wisdom (Barbuto & Millard, 2012; Cook-Greuter, 2005), findings also indicate that there was no significant difference between how leaders describe their propensity for wisdom and their measured adult stage of development. Thematic analysis of participant responses indicated that leaders who assessed at both the conventional and post-conventional stages of development described a propensity for wisdom. Based on these findings, the present study suggests that wisdom, in all its complexity, has its own trajectory and therefore necessitate inquiry into the lines of human development to include integral perspectives associated with spiritual, emotional, and psychosocial measures. The results of this study indicate the potential for additional research that explores wisdom in the context of both adult lines *and* adult stages of development to determine if specific correlations do exist.

The Relationship between Wisdom, Leadership, and Constructive-Developmental Theory

The recent socioeconomic crisis, including unstable fluctuations in the market and the complexity of an uncertain global economy, has challenged organizational leaders to reevaluate how they do business. Additionally, the distinct features of a networked society in the age of information require that leaders must now consider how they take action in the context of globalization and rapid fire communication (Bennis, 2007). As more and more organizations place greater emphasis on ethical and environmental issues, social responsibility, bottom line sustainability, and knowledge management, leaders are being held more accountable for their actions (Maak & Pless, 2006). In a global stakeholder society, for example, leaders are not only expected to be fiscally accountable to shareholders. They are also accountable to a range of stakeholders for the broader economic, environmental, and societal impact of their organization (Wade, 2006). Such high levels of diverse accountability require the integration of wisdom, creativity, and intelligence (Rowley, 2006; Sternberg, 2007). There is a far greater need for excellent judgment, insightfulness, and higher levels of strong moral character (McKenna, et al., 2009).

Wisdom, as an evolving construct, is now, more than ever, relevant to how leaders make key decisions for the common good (Sternberg, 2007). While there is no one agreed upon definition of wisdom, theorists contend that it is important to our understanding of leadership (Bennis, 2007; Yang, 2011). Wisdom enhances a leader’s overall ability to make moral and ethical choices (Lloyd, 2010) and increases the capacity for complex decision-making. Constructs related to wisdom include organizational wisdom (Kessler & Bailey, 2007), leadership wisdom (Yang, 2009; 2011), and wisdom management (Allen, 2008). From a practical perspective, greater understanding of wisdom and these related constructs have the potential to offer valuable insight into other aspects of organizational behavior that can potentially generate higher levels of business performance and success among leaders thereby influencing their overall ability to impact society (Bennis, 2007; Sternberg, 2007, Yang, 2011). The implication is that social responsibility is an essential component of leadership-related wisdom (Yang, 2011). Wise leaders are committed to the long-term welfare of both immediate stakeholders and humanity in general (McKenna et al., 2009; Sternberg, 2007).

In order for organizational leaders to more fully demonstrate a capacity for such transformative action, leading theorists contend that leaders can and should develop higher levels of wisdom (Barbuto & Millard, 2012; Sternberg, 2007; Yang, 2011). Principles of wisdom are particularly relevant to this time in history because wisdom is characterized by flexible, intuitive methods. The underlying premise therein is that if the basic tenets of wisdom are understood, leaders can also be evaluated according to robust criteria based on the principles of wisdom (McKenna et al., 2009). Leadership effectiveness can no longer be measured by organizational performance and profits alone.

While theorists suggest that wisdom is a key to how leaders effectively deal with complexity and in how they obtain a competitive advantage in the marketplace (Bierly, Kessler, & Christensen, 2000), it is worth noting that neither the construct of wisdom within organizations nor the processes associated with the cultivation of wisdom have received much attention in management and leadership discourse (McKenna et al., 2009; Rowley, 2006; Small, 2004).

While many definitions and research methodologies abound in the field of wisdom theory, one aspect of wisdom is often expressed. Wisdom, in all its complexity, represents the pinnacle of human development (Baltes & Staudinger, 2000; Kramer, 1990; Labouvie-Vief, 1990; Orwoll & Perlmutter, 1990; Pascual-Leone, 1990). As such, research linked to the study of wisdom is on the rise (Barbuto & Millard, 2012; Webster, 2007). While its relevancy to leadership and constructive-developmental theory is still unfolding, future research in this area promises an alternative approach to understanding the complexity of human development.

Ongoing and consistent research in the field of constructive-developmental theory has the potential to at least partially bridge the gap between leadership and wisdom. Leading theorists in this field continue to broaden our understanding of how leaders at differing stages of development engage in the transformational process of leadership. One underlying assumption of constructive-developmental theory suggests that leaders who demonstrate later stages of development have perspectives and insights that may also purport to greater levels of wisdom (Cook-Greuter, 2005). Barbuto and Millard (2012) further propose that as one transitions from one developmental stage to another, development will coincide with progression in wisdom development. The findings of this study suggest that wisdom can be experienced within earlier and later stages of development, albeit in different ways. I will more fully explicate these findings in the discussion sections of this article.

Theoretical Framework

Wisdom Theory

The theoretical framework for the present study is situated at the intersection of leadership, wisdom theory, and constructive-developmental theory. While references to the construct of wisdom span ancient teachings from Sumerian to Hebrew cultures, empirical studies within the psychological sciences only began to emerge in the late 1970s (Birren & Svensson, 2005). The literature includes paradigms of wisdom that have been debated since the field began to more fully emerge in the 1980s and ‘90s: (a) theological and philosophical perspectives on wisdom, (b) wisdom and the sciences, (c) the nature of wisdom in complex environments, and (d) the ongoing debate between explicit and implicit theories of wisdom. From this review, two major psychological wisdom paradigms emerged as relevant to the present study: wisdom as an expert system of knowledge (Baltes & Kunzmann, 2004; Baltes & Smith, 1990, 2008; Baltes & Staudinger, 1993, 2000) and the wise person theory (Ardelt, 2000, 2003, 2004a, 2004b, Clayton & Birren, 1980).

Since the focus of the study was on how conventional and post-conventional executive leaders experience wisdom, the present study is situated within the implicit theories of wisdom. More specifically, the present study aligns with the research on the wise person theory of wisdom because it is a first-person interpretative approach that aims to examine the real life experience of leaders. Greater emphasis was therefore placed on attributes of wisdom as an essential component of leadership (Ackoff, 1989; Jeannot, 1989; Jones, 2005; Prewitt, 2002) and as a positive result of human development (Kramer, 1990; Labouvie-Vief, 1990; Orwoll & Perlmutter, 1990; Pascual-Leone, 1990).

Major Debates in the Field

Within the context of explicit and implicit theories of wisdom, debates in the field are divided by two main ways to conceptualize and study the construct. The first approach is based on a traditional view of ancient writings of Western philosophers wherein wisdom is studied as a theory of knowledge, judgment, and advice about difficult and uncertain matters of life (Baltes & Kunzmann, 2004; Baltes & Smith, 1990; 2008; Baltes & Staudinger, 1993). The second approach is based on Asian philosophy and addresses wisdom from the perspective of *wise* *persons* (Ardelt, 2000, 2003, 2004a). Western explicit theories of wisdom most often focus on knowledge and analytic capabilities, whereas Eastern implicit theories tend to emphasize the embodiment of the cognitive, reflective, and affective domains of wisdom (Ardelt, 2004a; Takahashi, 2000). These three domains as set forth in Table 1 served as a first-person interpretive lens in examining the wisdom experience of participants in this study.

Table 1: Definitions and operationalization of wisdom as a three-dimensional personality characteristic.

Domain of Wisdom	Definition	Coded to Assess How Leaders
Reflective	Different ways participants reflect; the qualities of reflection; how participants overcome subjectivity and self-projection	– reflect on adversity in life – reflect on differences in others to include social/cultural values – reflect on the essence of their work – reflect on themselves in relation to people and situations – reflect on multiple perspectives of other – gain self-insight and reflect on own capacities/strengths – reflect on spiritual and religious aspects of life – reflect on wisest self in relation to phenomenon and events
Cognitive	How participants structure experiences and make meaning from them. What is the logic behind their perspectives of self in relation to world? Desire to know truth and attain deeper understanding of life.	– describe adversity in life – accept ambiguity and uncertainty – describe essence of work in relation to purpose or calling – balance adaptation of environment with interest of the common good of society – integrate complex thought, action, and feeling – make important decisions in midst of uncertainty – take opposing views into consideration – describe themselves in relation to larger system – describe the construct of wisdom – increase own capacity for wisdom
Affective	Different aspects of emotion demonstrated in behavior	– respond to adversity – respond to ambiguity – demonstrate empathy and compassionate love for others – balance empathy and goal achievement – feel and act on behalf of greater good of organization – demonstrate humility – use humor to offset challenges – create results in dire situations

Adapted from Ardelt (2003 and Clayton & Birren (1980).

Wisdom as an expert system of knowledge vs. the wise person theory

In the early 1980s, the Max Planck Institute for Human Development and Education (commonly referred to as "The Berlin Group") developed what is still the most widely used explicit model of wisdom. Introduced as the Berlin Wisdom Paradigm (Baltes & Kunzmann, 2004: Baltes & Smith, 1990; Baltes & Staudinger, 1993), wisdom is defined as a high level of exemplary expertise in dealing with the fundamental problems related to the meaning and conduct of life (Kunzmann & Baltes, 2003). Examples of such fundamental problems include complex life and death issues, career moves, family conflicts, and life-span transitions such as aging or loss of a loved one.

As the preeminent leaders in wisdom research, Baltes and his associates set forth the premise that such pragmatics of life address wisdom within the context of life planning, life management, and life review (Baltes & Kunzmann, 2004; Baltes & Smith, 2008). Additionally, wisdom-related or expert knowledge is researched and assessed according to five wisdom criteria: rich factual knowledge, rich procedural knowledge, life-span contextualism (strategies, judgment, advice concerning matters of life), value relativism (differences in values, goals, and priorities), and uncertainty (Baltes & Kunzmann, 2004; Csikszentmilhalyi & Nakamura, 2005). Expert knowledge about the meaning and conduct of life approaches wisdom when all five criteria are present. The criteria are designed to reflect a balance between intellect and character and thereby offer an integrated perspective of wisdom.

The Berlin Group offers a stringent perspective on wisdom as a knowledge-based construct that emphasizes the functional consequences of wisdom over *how* one acquires it. While these theorists do take into consideration the cognitive, emotional, motivational, and virtuous aspects of the individual (Ardelt, 2004a; Baltes & Kunzmann, 2004), they are juxtaposed against research on wise people claiming that such individuals are an imperfect illustration of wisdom (Baltes & Kunzmann, 2004). Wise sages as we know them (e.g., Buddha) are, therefore, recognized as carriers of wisdom-related knowledge rather than the road to understanding the construct of wisdom. The contention herein is that most wise individuals move through several reconstructions and purifications. Because they are fallible and imperfect, they cannot reach an ideal level of wisdom (Baltes & Kunzmann, 2004). The Berlin Group therefore contends that research should focus more on wisdom as a body of knowledge rather than on implicit studies of wise persons.

Within the context of adult-developmental theory, however, one underlying premise of the present study is that the road to wisdom *is* paved with reconstruction and purification. While the Berlin Group's research on wisdom as an expert system of knowledge is important and vital to our understanding of wisdom, it is a non-hierarchal model that does not recognize aspects of developmental movement (Alexander, Druker, & Langer, 1990). It therefore fails to acknowledge potential for the transformative processes associated with such movement and higher stages of consciousness. Developmental theory contends that each stage of development is more complex than the previous stage because as the person evolves, he/she is able to integrate and differentiate previous stages of development into a more complex understanding and experience of life (Cook-Greuter, 2005; Torbert, et al., 2004). This ability to integrate and differentiate may translate to higher levels of wisdom (Barbuto & Millard, 2012; Cook-Greuter, 2005). The Berlin Group, however, does not acknowledge later stages of development that encompass and reorganize based on earlier stages of development (Alexander, Druker & Langer, 1990). Further, as a cognitive model (Ardelt, 2004a; 2004b), it eliminates perspectives associated with reflective thought and higher states and stages of consciousness.

The wise person theory of wisdom expands upon wisdom as an expert system of knowledge by acknowledging that even the most profound wisdom literature, e.g., the Bible or the ancient Vedic texts, remain intellectual or theoretical knowledge until the wisdom associated with that knowledge is realized by a person (Ardelt, 2004a; 2004b). Wisdom is therefore more than an intellectual construct. It is the experience of knowledge as it is re-transformed into the person's ability to arrive at some deeper understanding or meaning-making about a situation or life event. Interview protocols that seek out the wisdom experience of an individual's own life situation offer a unique perspective in that they align with an important premise linked to the construct of wisdom: the value and importance of interpretive knowledge (Kekes, 1983).

To have an understanding of the pragmatics of life without being able to adequately apply that knowledge to one's own life circumstances does not equate to wisdom. Interpretative knowledge, therefore, does not refer to an intellectual interpretation of facts but to a paradigm shift in knowing. Wisdom is not a state of perfect knowledge (Baltes & Kunzmann, 2004); it is a state of *being* (Ardelt, 2004b). This state of being is realized through reflection on one's life experiences and how those experiences transform the individual (Ardelt, 2004b; 2005). This state also encompasses the knowing or cognitive capacity of the individual as well as how the individual affectively responds to others; it should therefore be measured by assessing the wisdom experience of people rather than by the wisdom of their knowledge. Wisdom is therefore perceived as a property of the individual and the integration of the cognitive, reflective, and affective characteristics of that individual (Ardelt, 2000; 2004a; 2005).

In keeping with this paradigm of wisdom as an implicit theory that measures the wisdom experience of people, this study was designed to elicit the personal experience of individual executive leaders and to determine how, if at all, those experiences may have transformed them as individuals.

Constructive-Developmental Theory

In her pioneering work on ego development, Loevinger (1976) postulated that there is an order to stages of development. In essence no order or stage can be skipped; each stage is more complex than the previous, and each stage is based on the preceding stage and therefore prepares the individual for the stage to follow (Loevinger, 1976). The present study focused more specifically on the framework of constructive-developmental theory that encompasses the specific body of work linked to neo-Piagetian paradigms. These theories are deemed such because they expand the early work of Jean Piaget beyond the scope of childhood cognition to include the transformational processes and emotions associated with stages of adult development (McCauley et al., 2006). These stages of development set the foundation for work by later researchers such as Torbert (1987; 2004), and Cook-Greuter (1999).

Constructive-developmental theory, or what some theorists refer to as adult stage development, is positioned as constructive in that it explores how individuals construct or interpret their life experiences. Similarly, the theory is positioned as developmental in that it explores how those interpretations can change and become more complex over time (McCauley et al., 2006). The theory contends that a person's growth and development is a process whereby the individual adopts more complex ways of making meaning of life experiences (Kegan, 1982; Cook-Greuter, 2000; Torbert, 1987). Each stage of development is more complex than the previous stage because as the person evolves, he/she is able to integrate and differentiate previous stages of development into a more complex understanding and experience of life. Accordingly, McCauley et al. (2006) states that: "Constructive-developmental theory concerns itself with two primary aspects of development: (a) the organizing principles that regulate how people make sense of themselves and the world (orders of development) and (b) how these regulative principles are constructed and re-constructed over time (developmental movement)" (p. 636).

Developmental theorists divide the spectrum of human consciousness into four main tiers: pre-conventional, conventional, post-conventional, and transpersonal (Cook-Greuter, 2004, 2005). Every stage has the potential for strengths and weaknesses, and each stage offers specific characteristics associated with impulse control, character development, interpersonal relations, and conscious preoccupation to include self-concept—none of which can be measured separately because they are so intimately intertwined (Loevinger, 1966; 1976). For over two decades, theorists in the field of leadership and management have looked to stage development theory as a way to better understand how leaders think, take action, and make meaning out of their experience of leadership. Since the field of constructive-developmental theory is the stage development theory most often associated with leadership and management (Cook-Greuter, 2004; McCauley, Drath, Palus, O'Connor, & Baker, 2006), it is one of the core theoretical frameworks for the present study.

With this most important premise of human development at the forefront, the present study offers a deeper understanding of wisdom through the experiential lens of executive leaders in the context of their adult stage of development. What they *say* about their experience of wisdom will add to the body of knowledge of first-person descriptions of *how* executives live out aspects of wisdom as primary leaders in their respective fields.

Constructive-developmental theorists contend that individuals who measure at the post-conventional levels have a greater capacity for integration of complex thought, action, and feeling (Cook-Greuter, 2004). While the research is not yet fully defined on how this integration may interrelate with theoretical perspectives on wisdom, leaders who measure at post-conventional levels are deemed more successful at positioning their organizations through change and in adapting to complex environments (Cook-Greuter, 2000; Fisher, Merron, & Torbert, 1987; Merron & Torbert, 1987). By contrast, the conventional levels of development are viewed as the stages more associated with linear perspectives. Leaders who measure within these stages, for example, may demonstrate wisdom via analytic logic. However, they would not necessarily recognize their capacity to construct meaning.

In discussing the intersection between the theoretical frameworks on wisdom and constructive-developmental theory, the focus of this study is limited to categorical descriptors associated with the conventional and post-conventional stages of development as defined by Cook-Greuter (2005) and Torbert & Herdman-Barker (2013).

The conventional stages refer to three developmental stages: the Diplomat/Conformist (3.0), Expertise/Self-Conscious (3.5), and Achievement/Conscientious (4.0). These three stages pertain to developmental levels of most individuals after the age of 12; approximately 80% of the population measures within these ranges, with most individuals indicating a transition from the Expertise/Self-Conscious stage to the Achievement/Conscientious stage. For example, thirty-percent of people in a mixed sample of 4510 profiled at the Achievement/Conscientious action logic (Torbert & Herdman-Barker, 2011).

Table 2: Differentiations between Categorical Descriptors and Scoring of 3 Developmental Models.

	Torbert Action Logics	**Cook-Greuter** Ego Development Stages	Scoring	**O'Fallon** StAGES Model	Scoring
				Illumined	6.5
	Ironic	Unitive	6	Universal	6.0
				Transpersonal	5.5
	Alchemical	Construct-Aware	5/6	Construct-Aware	5.0
	Strategic-Systems Oriented	Autonomous	5	Strategist	4.5
Post-Conventional	Values-Oriented	Individualist	4/5	Individualist	4.0
	Achievement-Oriented	Conscientious	4	Achiever	3.5
Conventional	Expertise-Oriented	Self-Conscious	3/4	Expert	3.0
	Diplomatic	Conformist	3	Diplomat	2.5
	Opportunist	Self-Defensive	2/3	Rule-Oriented	2.0
	Impulsive	Impulsive	2	Opportunist	1.5
Pre-Conventional				Impulsive	1.0

Adapted from Cook-Greuter (2002) and Torbert (2013). Note: O'Fallon (2014) has identified three stages within the earlier stage identified as Unitive by Cook-Greuter and Torbert. In light of this data, O'Fallon also views the Construct-Aware Stage as the first Post-Conventional Stage. Additionally, Cook-Greuter and Torbert do not score for the Rule-Oriented stage.

The post-conventional stages refer to the three developmental stages: the Values-Oriented/Individualist (4.5), the Systems-Strategic/Autonomous (5.0), and the Alchemical/Construct-Aware stage (5.5). At the first post-conventional level, people begin to realize that the meaning of things is dependent upon their own perspective and interpretation (Cook-Greuter, 2005).

Table 2 represents the linguistic diversity between the Ego Development Model as expressed by Cook-Greuter (2002) and Torbert's Action Logics (2011, 2013). The StAGES model (O'Fallon, 2014) is also represented as the latest stage development model. Since it can be somewhat cumbersome and confusing to move between the various linguistic descriptors set forth by Cook-Grueter and Torbert, I will utilize the StAGES numerical scoring for the range of stages represented in this study. The significance of the StAGES model will be more fully explicated in the discussion on Future Research.

The Study

Research Design

The reasoning and processes involved in describing how someone experiences wisdom can be more challenging to detect via quantitative methods (Yang, 2011). The study was therefore designed as an exploratory qualitative study that involved a 1st-person interpretative approach to investigating leaders in their natural settings. In-depth semi-structured interview questions were designed to elicit the candid responses of 12 executive leaders and to determine how those responses related to their adult stage of development. The SCTi-Map was the instrument used to determine those stages.

Methodology

Selection and Recruitment

Executive leaders were purposefully recruited and selected via the researcher's corporate database and nominations from other leaders. The criteria for selection centered on mid-to-senior-level executives engaged in government, corporate, or non-profit settings (to include educational and religious entities) who had undergone a form of major transformation in their organization within the prior 5 years. For purposes of this study, major transformation is defined as corporate downsizing, loss of client base, loss of profits, or any self- identifying factor that has constituted a major shift in systems, processes, policies, or the infrastructure of the organization, to include leadership strategies. Every effort was made to secure a diverse population to include religious affiliation, gender, age, and ethnicity. The objective was to select executive leaders within these environments who scored within the conventional or post-conventional stages of adult development based on the results of the SCTi-Map.

Sample Population

The age of participants ranged from 44-70 with the median age at 60. Religious affiliation was only moderately represented by one atheist and one participant in the Hindu faith. Since the focus of the study was on executive leaders who measured at the conventional and post-conventional stages of development, this limitation was not a factor. The sample population was comprised of 8 males and 4 females. The private sector was represented by 41% whereas the public sector was represented by 16% of the population. Four of the participants (33%) were from non-profit organizations, and one participant was from a private foundation. The education level of participants ranged from Bachelor's Degree to Doctorate Degree and included two participants with Juris Doctor Degrees. Executive level positions included 50% of respondents at the Founder/President or CEO/COO level, 2 senior-level pastors from a large mega-church environment, 2 equity partner attorneys, 1 managing partner of an international medical technology company, and 1 technology consultant. Annual operating budgets ranged from $400,000 to $175M.

Procedure

The study involved two methods of data collection: the administration of the SCTi-Map (Cook-Grueter, 2008) and semi-structured interviews (Lincoln & Guba, 1985). Contact summary sheets and analytic memos were also utilized to reflect on preliminary themes that rose from the initial interviews and to capture ideas and relationships between codes during the process of coding and analysis (Miles & Huberman, 1994).

A pseudonym was assigned to each participant prior to their taking the SCTi-Map assessment. The SCTi-Map responses for each individual were then scored by an independent rater who has been trained according to the standards and protocols of Cook-Greuter and Associates. In an effort to minimize transformational bias (Cook-Greuter, 2011) toward any one specific stage during the analysis process, participants' scores were withheld from the researcher until after completion of the first coding and analysis cycle. Participants stages ranged from 3.0 to 4.5. Since Cook-Greuter's instrument depicts the 4.5 stage at the post-conventional level, no additional recruitment was deemed necessary. However, it should be noted that this decision proved to be a limit to the study in that some researchers view the 4.5 stage as a transitional stage to the post-conventional levels.

All participants were interviewed for 60-90 minutes. Three participants were interviewed over the phone due to distant locations. The remaining 9 interviews were conducted face-to-face by the researcher. Interviews were tape recorded and 10 of the 12 interviews were transcribed by an independent professional. The additional 2 interviews were transcribed by the researcher to protect anonymity of two of the participants who are very well known. Each recorded interview was transcribed verbatim and proofread word-by-word by the researcher.

The semi-structured interview questions related to the leaders' perceived role within the organization, personal wisdom experiences, wisdom as a construct, values and beliefs, the essence of their work, and responses to adversity.

Data Analysis

Thematic analysis (Saldaña, 2009) involved two separate and distinct coding cycles. The first cycle involved multi-phases of analysis to ascertain rich, thick descriptions (Maxwell, 2005) of the leaders’ responses. This initial phase was important to determine if their responses indicated a propensity for wisdom. Interview responses were coded into key aspects of general wisdom theory (Baltes & Smith, 1990, 2008) and personal wisdom theory (Ardelt, 2000, 2004a, 2005). Once the data and initial findings from the first cycle of analysis were clearly delineated, the results of the SCTi-Map were revealed to the researcher.

First Coding Cycle: Analysis, Coding, and Emergence of Leaders’ Experiences of Wisdom

The first coding cycle was divided into four separate phases.

Phase 1: review of transcripts

Phase 1 was aimed at understanding how the participants construct and make meaning of their wisdom experience (Strauss & Corbin, 1998). Consistent with a data-driven approach to analysis, the first six interviews were reviewed for preliminary code development. Each transcript was coded and analyzed using a multi-step iterative process of thematic analysis as set forth by Boyatzis (1998). This process involved the categorization of data, analysis of narrative structure and contextual relationships, the integration of themes, and the interpretation of major themes and descriptions (Creswell, 2009; Maxwell, 2005; Newman, 2003). The researcher systematically reviewed and analyzed over 15 hours of interview transcripts. This process allowed for insight into the overall theme of each transcript and how the theme might compare to contact summary sheets that were written post-interview of each participant.

A second review of the transcripts involved pre-coding methodologies (Saldaña, 2009) that identified key statements and helped determine patterns of expression. Those patterns of expressions were then compared and contrasted with one another to determine emerging codes. To ensure consistent quality of codes, a code book was developed to ensure that the definition and description of the codes would be accurately applied to future coding. The initial six transcripts were reviewed a third time and coded against the emerging themes to determine consistency of judgment.

Phase 2: code transcripts

The raw data of the final six interviews was then used to further validate the emerging themes. Once consistency of judgment was determined with respect to the emerging codes, the researcher reviewed the conceptual framework, the interview protocol, and the research question as a guide for articulation of meaningful themes. Additional codes were then developed to allow for responses within the individual domains of wisdom. To test the wise person theory of wisdom, responses were then subjected to an additional level of analysis to determine how they corresponded to the coding within the separate domains of wisdom, the reflective, cognitive, and affective. Research indicates that wisdom is a real-life phenomenon that can be recognized by others without much difficulty (Baltes, Staudinger, Maercker, & Smith, 1995). Based on this assertion, the researcher analyzed all 12 transcripts again and identified 847 “wisdom” responses within the three domains of wisdom.

Content from all 12 transcripts was then analyzed via a first cycle of descriptive coding (Miles & Huberman, 1994; Saldaña, 2009). This level of coding was chosen as a form of analysis because it is well suited to studies with a variety of data forms. As an iterative process, this level of analysis involved repeated review of raw data. Codes were then expanded or collapsed accordingly.

Phase 3: interpretation of data

This phase involved review of all analytic memos to identify key learning points from the first cycle of descriptive coding. A summary of each code was written, and summaries were arranged into clusters to determine higher levels of abstraction and how themes might emerge or converge (Miles & Huberman, 1994). Summaries were also analyzed in terms of the integrative domains of wisdom.

Phase 4: finalization of themes

This phase involved a return to the raw data to determine if the coded segments of the interview did in fact correspond to the emerging themes. Themes were refined as the data were repeatedly analyzed to ensure accurate representation. This repeated immersion in the interview transcripts allowed for rich, thick data to emerge and for a deepened understanding of the phenomenon. A final stage of clustering resulted in the organization of themes based on the domains of wisdom. Each theme was then named and tagged with an exemplar.

Second Coding Cycle: Analysis and Coding of Domains of Wisdom in Relation to Stages

Since the study was designed to elicit the wisdom experience of executive leaders who scored within the conventional and post-conventional stages of development, it was important to engage in a second coding cycle once the SCTi-Map scores were revealed. The purpose of this cycle was to analyze and code participant responses to determine if there was a relationship between their stage development score and their responses within each of the integrative domains of wisdom. This process involved reentry into the originally coded data. Patterning and clustering of the data was used to determine the descriptive responses of the participants and how those responses corresponded to the three domains of wisdom and their individual stage of adult development.

Phase 5: analysis of responses across the integrative domains of wisdom

Participant responses previously coded into the cognitive, reflective, and affective domains of wisdom were divided up by participant and analyzed to determine their primary domain of wisdom. Responses included all data previously coded in the subcategories of the coding schema as defined in Table 1. This table represents the definition and operationalization of wisdom as an integrated three-dimensional component of personality. These definitions were adapted from earlier research (Ardelt, 2003; Clayton & Birren, 1980) in an effort to accommodate a more qualitative and interpretative approach to the research. Clayton and Birren (1980) originally determined these domains through a multidimensional scaling process of 12 wisdom attributes (Ardelt, 2005).

The purpose of this level of analysis was to determine if participant responses were integrated across all three domains or if the participants described their experiences from a primary domain (e.g., cognitive, reflective, or affective). Because cognition is required in order to experience the reflective or affective aspects of personality (Wilber, 2000), the categorical responses were divided according to the cognitive, cognitive/reflective, cognitive/affective, and the cognitive/reflective/affective domains of wisdom.

The process involved a review of the coded data for each participant to ensure that the response in each domain was in fact appropriately coded according to the definition as outlined in the coding schema. A percentage of responses for each domain was then determined (Appendix A) to ascertain the primary domain of wisdom described by the participant. For example, 25.96% of the overall responses in the cognitive domain were expressed by Participant 1. Those responses were separated out from the remaining participant responses. Each of his 28 cognitive responses were then analyzed line-by-line to ensure they fit into the cognitive domain. Responses that reflected a direct cognitive response, according to the definition, were separated out and assigned a percentage rate. For example, Participant 1 indicated 19% of his responses in the cognitive domain. Responses that indicated more of an integration of the three domains or of the cognitive/reflective, cognitive/affective domains were separated out into those categories and given a percentage rate as appropriate. Participants' primary domain of wisdom was then determined by their highest percentage rate. For example, Participant 1 indicated 48% of his responses in the primary wisdom domain of the cognitive/affective category.

Phase 6: analysis of responses across the stages/action logics

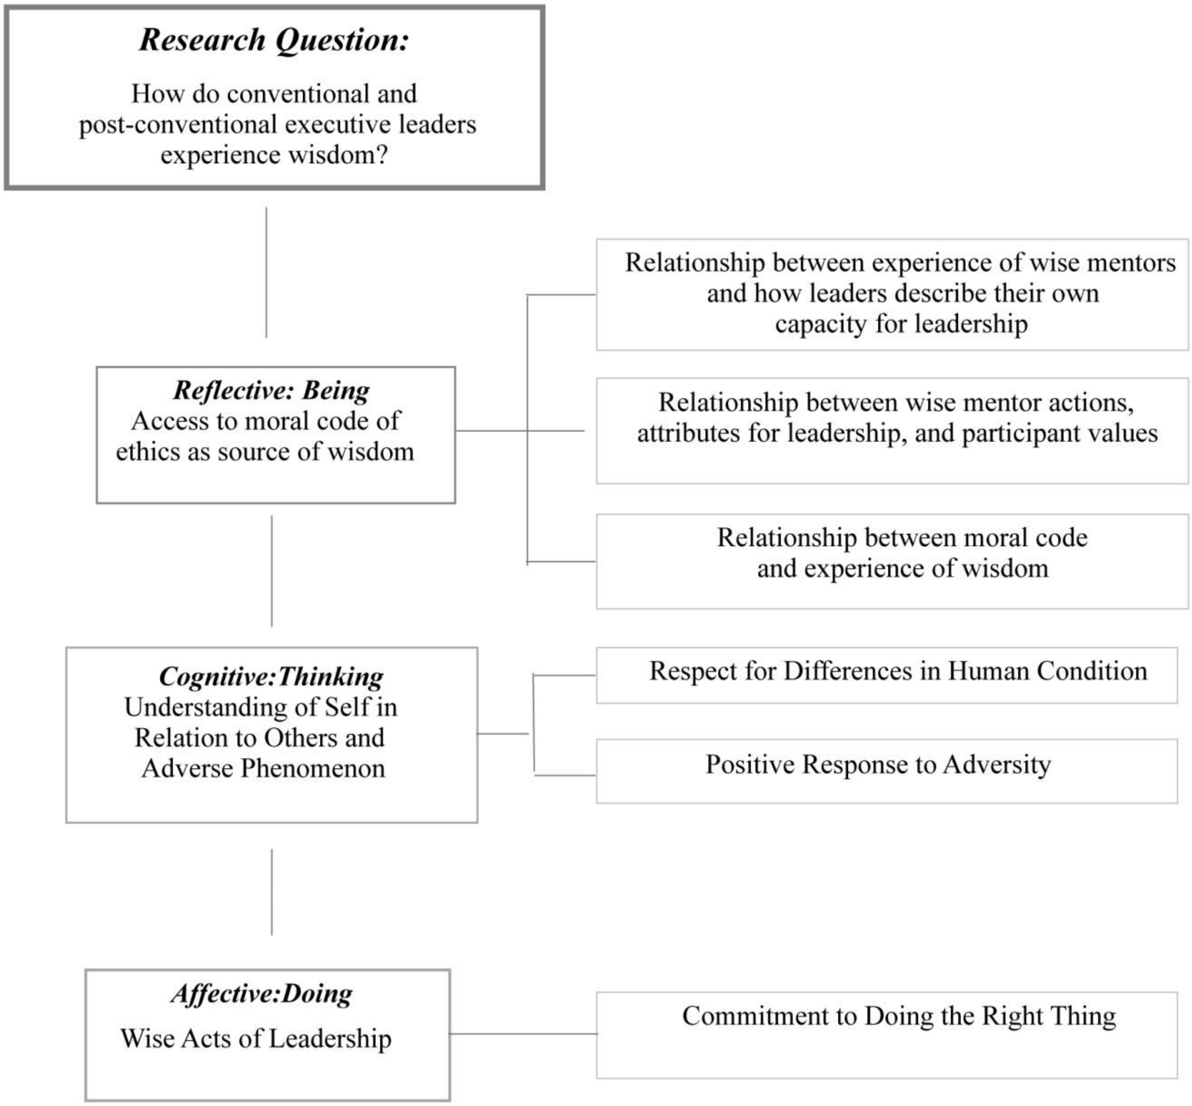
The purpose of this level of analysis was to determine if there was a relationship between how participants experienced wisdom, via their primary wisdom domain, and their stage of development or action logic (Torbert and Herdman-Barker, 2013). Participants' responses previously coded into the three domains of wisdom were analyzed and coded against the action logic lexicon for each stage of development. For example, if a cognitive response aligned with the lexicon and understanding associated with the 3.5 action logic, that response was coded at the Expertise level. Responses were then mapped across several action logics as appropriate for each participant. This detailed level of analysis involved coding representative of each action logic against the single or integrated domains of wisdom. For more information regarding the outcomes of this detailed level of analysis, see Spano (2013).

Key Findings

Based on the literature on wisdom and constructive-developmental theory, it initially seemed probable that leaders who measured at the conventional stages of development might fail to indicate a propensity for wisdom beyond a linear, cognitive perspective. Similarly, it seemed probable that those who measured at the later or post-conventional stages of development would indicate integration of the three wisdom domains. Key findings, however, suggest otherwise.

The initial cycle of analysis was necessary to determine if the leaders presented as "wise" based on the definition of wisdom as it corresponds to the three domains of wisdom outlined in Table 1. It was anticipated that participants who lead within more linear, analytic disciplines, e.g., attorneys or engineers, might demonstrate a propensity for wisdom, if at all, only within the cognitive domain of wisdom. However, this did not prove to be the case. Based on thematic analysis of the initial data, all 12 of the respondents indicated a propensity for wisdom albeit in different ways. The significance of the initial key findings that emerged within each of the domains of wisdom emphasized the complexity of human development and the elusive nature of wisdom.

The process of thematic analysis as outlined above revealed the major themes depicted in Figure 1.



Research Question:
How do conventional and post-conventional executive leaders experience wisdom?
Reflective: Being
Access to moral code of ethics as source of wisdom
Relationship between experience of wise mentors and how leaders describe their own capacity for leadership
Relationship between wise mentor actions, attributes for leadership, and participant values
Relationship between moral code and experience of wisdom
Cognitive:Thinking
Understanding of Self in Relation to Others and Adverse Phenomenon
Respect for Differences in Human Condition
Positive Response to Adversity
Affective:Doing
Wise Acts of Leadership
Commitment to Doing the Right Thing

Figure 1: Themes and Key Findings First Cycle of Analysis.

A brief overview of the findings from the First Cycle of Analysis will be now be discussed.

First Cycle of Analysis

Reflective: Access to Moral Code of Ethics as Source of Wisdom

From a reflective stance, all participants access a strong moral code of ethics as a source of wisdom. They may, however, do so from introspective practices such as prayer and meditation or through more cognitive processes. The reflective component of wisdom speaks to how participants move beyond knowledge and skill and what they know for certain through the process of logic and formal reasoning to understanding issues of knowing in the face of uncertainty (Kitchener & Brenner, 1990).

Responses indicated that all 12 participants were able to move beyond knowledge to levels of "knowing" by accessing a moral code of ethics. This moral code is embedded in who they are. It stems from societal and religious norms that have been impressed upon them in early developmental years. This moral code was also formulated by early career experiences with someone they described as a wise mentor. How they construct meaning within the context of this moral code is one aspect of how they experience wisdom. This system of morality or code of values guides choice and actions. Wisdom is not something they do as all decisions and resultant outcomes are not perfect; it is, however, part of their existence or way of being. These findings indicated that the participants are wise leaders, each in different and unique ways; this individual way of being is reflected in the way they live out the day-to-day experience of wise leadership.

Cognitive: Understanding of Self in Relation to Others and Adverse Phenomenon

Respect for differences in the human condition

Wisdom is manifested in our understanding of differences and the multiple perspectives of others (Ardelt, 2000; Kitchener & Brenner, 1990). Consistent with this premise, all participants demonstrated a deep understanding of themselves in relation to others and a surprising respect for differences in the human condition. This respect was described in relation to employees, clients/customers, and in some instance, the greater society.

Participants expressed appreciation of employee differences within an underlying theme of respect, care, and/or responsibility. This appreciation, however, was expressed differently based on the organizational sectors represented. For example the public and private sector respondents expressed client appreciation via a more cognitive response of solving problems for the client, increasing the bottom line for the company, and being accountable to a board. While these differentiations may seem obvious responses from anyone in a leadership role, participant knowledge and ability is strongly engulfed in a passionate desire to make a difference for their clients. Wisdom is therefore expressed via their ability to provide information and advice on the pragmatics of life such that their clients can make the best decisions for their businesses.

Leaders from the non-profit organizational sector, however, offered a more altruistic approach that included a systems perspective beyond the client or immediate needs of the community. Both the pragmatic and altruistic approaches to wisdom require some integration of the reflective, cognitive, and affective domains; however, this process is lived out or expressed at different levels. For example, in the pragmatic levels described above, wise leaders may reflect from rational thought or logic; they rely on facts. Those who engage in reflection from a broader systems perspective, however, seem to arrive at more altruistic levels of respect and appreciation beyond the scope of the individuals they directly serve. Such expression of service often extends beyond the organization, for example, to the global society.

Such acts suggest understanding and acceptance of the positive and negative aspects of human nature (Ardelt, 2005) as they relate to the construct of wisdom. The diversity of these responses, however, also indicates that how leaders experience wisdom within the integrative domains of the cognitive, reflective, and affective aspects of personality is not a clear path of discovery. The interrelationship between the domains of wisdom is complex and requires exploration into the multidimensional aspects of the spiritual, emotional, and psychosocial measures of an individual in order to more fully understand how leaders fully live out their experience of wisdom. Questions related to the phenomenon of adversity were therefore explored in the hopes of gaining some level of insight into the more complex aspects of the participants' meaning-making systems.

Positive response to adversity

Research indicates the importance of examining wisdom within the context of adversity (Ardelt, 2005; Kekes, 1983; Kitchener & Brenner, 1990). This aspect of wisdom also includes how individuals understand themselves in relation to the inherent limits of knowledge and how they understand and accept the unpredictability and uncertainty of life (Ardelt, 2005). Adversity can be expressed as any negative misfortune or crisis that results in calamity or distress for the individual. Depending on the meaning-making systems of the person, to include perception, interpretation, and levels of wisdom, even a minor infraction can be viewed as adversity. One clear aspect of adversity is that it is part of the human experience. How individuals maneuver their way through such moments of misfortune is often determined by their theological, philosophical, or psychological approach to life.

While not all adversity leads to greater levels of wisdom, research indicates that the ability to cope with crisis and hardship may not only be a hallmark of wise individuals, it may also be one of the pathways to wisdom (Ardelt, 2005; Pascual-Leone, 2000). Wisdom theory therefore suggests that leaders would be fully capable of dealing with any crisis and obstacles they may encounter (Ardelt, 2005; Baltes & Kunzmann, 2004; Kekes, 1983; Kunzmann & Baltes, 2003).

Findings indicated that 11/12 of the participants expressed an ability to endure and persevere through extreme measures of adversity. One participant did not feel he had experienced adversity because in his estimation adversity is greater than the day-to-day challenges of life. Daily challenges, in his estimation, are simply problems to solve. Since he had not experienced loss of family, income, or extreme illness, he did not view adversity as part of his life experience.

Consistent with the literature on wisdom and adversity, participants engaged in *active coping* as set forth by Ardelt (2005) in several specific ways: (a) reframed the situation to make the best of it; (b) demonstrated the ability and willingness to take control of the situation based on their own experience, skills, or talents; (c) came to the understanding that one doesn't always have control over external circumstances; (d) accepted that adversity is part of life and that life is unpredictable and uncertain; (e) accepted that death or loss is a part of life; (f) expressed a trust in the benevolence of others and, in some instances, God.

The aforementioned findings suggest that how leaders handle adverse circumstances may have an impact on how they develop their own capacity for wisdom. Participant responses indicated that adversity is viewed as an opportunity to gain insight and wisdom about self and others. Through adversity, participants learned to embrace challenge, have faith in their own experience and/or God, and to make better and wiser decisions.

Affective: Wise Acts of Leadership

The ebb and flow of how participants reflect and think about daily organizational life is translated into affective behavior, the *doing* aspect of wisdom, or what can be deemed as “wise acts” of leadership. While participants did not expressly describe their actions as “wise,” the process of thematic analysis revealed interesting differentiations in how they deliver products and services. Responses were coded according to thoughts or actions specific to client needs versus those for the greater good of the organization or those set forth on behalf of the common good of society. All 12 participants expressed a commitment to doing the right thing. Twelve of the executive leaders described affective responses specific to their clients. Additionally, all 12 expressed actions for the greater good of the organization. However, only 6/12 responses demonstrated affective behaviors for the common good of society.

The significance of these initial findings was not fully realized until the SCTi-Map scores were revealed. While the first cycle of analysis indicated that there were differentiations in how participants described their commitment to doing the right thing, the second cycle of analysis indicated that there was no significant relationship between stages of adult development and how the participants demonstrated affective behavior towards either the client or the great good of the organization or society at large. Leaders who measured at both the conventional and post-conventional levels of development described affective behavior for the common good of society.

In conclusion, these “wise acts” of leadership are focused on that which is right and just for the client/customers served, the overall good of the organization, or the overall common good of society. In either instance, wise decisions are made based on what is “right and just” for someone or something outside and beyond self. There was little to no evidence of egocentricity in the responses of these executive leaders.

These initial findings further emphasized the complexity of wisdom and the need for greater understanding of the participants’ spiritual, emotional, and psychosocial development. While each of 12 participants indicated a propensity for wisdom, they did so in unique and different ways. Findings from the First Cycle of Analysis did indicate, however, that they do so within the broader scope of a strong moral code, an understanding of self in relation to others and adverse phenomenon, and in their commitment to doing that which is right and just for their organizations, the people they serve, and, in some instances, society-at-large.

Their propensity to experience wisdom in unique ways within the context of their adult stage of development was further substantiated by findings of the Second Cycle of Analysis.

Second Cycle of Analysis

The second cycle of analysis was important to ascertain if the leaders experienced wisdom within the integrative domains of wisdom, and, if so, how that experience related to their adult stage of development. Since the findings were surprisingly contradictory to existing theories on wisdom and constructive-developmental theory they are presented in support of my argument that wisdom has its own trajectory and therefore necessitates inquiry into the lines of human development as well as the stages of adult development.

Results of the SCTi-Map

The SCTi-Map scores denote each respondent's primary stage or center of gravity (Cook-Greuter, 2005; Torbert & Herdman-Barker, 2013). Participants' individual scores ranged from 3.5 to 4.5 and are representative of the Total Protocol Rating which indicates the statistical measure and qualitative appraisal of the SCTi-Map protocol as scored and assessed by Cook-Greuter. What this essentially means is that the TPR rating is a combination of the statistical score from the inventory, and it also includes the qualitative judgment of the rater. For example, if a participant scores within a statistical range of 4.5, the expertise of the rater might also discern that the respondent's sentence stems indicate an early or late stage of development within that range; hence the plus and minuses depicted in Appendix A. Note that Participant 9 indicates a score of 4/5-. This score indicates that this particular participant has only recently transitioned to the 4.0 stage; she is in the early stage of this level.

The results of the SCTi-Map indicated that eight of the participants measured within the conventional ranges of development: three measured at the 3.5 level, and five measured at the 4.0 level. The remaining four participants, measured at the post-conventional stage 4.5. It is also worth noting that three of the four participants who measured at the post-conventional level were women.

While these scores are representative of the participants' center of gravity (Cook-Greuter, 2005; Torbert & Herdman-Barker, 2013), it is not unusual for the dynamic of development to include a pull toward later stages of development. Under the right conditions and depending on the person's state of consciousness, e.g., the concrete, subtle, causal, and nondual tiers (Wilber, 2006) an individual may indicate meaning-making capacities and actions within later stages of development or vice versa. For example, a person may have a peak spiritual experience at the earlier concrete state of consciousness, however, that peak experience does not necessarily mean they have moved to a later stage of development.

The complexity of this developmental movement can perhaps best be described as a "rocking back and forth" (O'Fallon, Personal Communication, 2014) as individuals experience themselves in transition between earlier and later stages. The results of the SCTi-Map for this specific population, therefore, also indicated a range of responses from earlier to later stages. This range represents the nuanced dimensions of the meaning-making capacity of the individual. A participant may indicate scores in earlier stages just as readily as he may indicate scores in later stages of development.

As further evidence of this premise, five of the participants who scored within the conventional range of 4 also indicated SCTi-Map responses in the 4.5 range. Three out of the four participants in the post-conventional range of 4.5 indicated assessment responses in the 5.0 stage. After the results of the SCTi-Map were revealed, the second cycle of analysis further supported the propensity for these specific participants to gravitate toward later stages of development.

Analysis of Wisdom across the Stages/Action Logics

The second level of analysis also involved mapping participant interview responses across multiple stages of development according to the lexicon of stage-development theory as recently set forth by Torbert and Herdman-Barker (2013). The reason for shifting from the SCTi-Map lexicon to the Action Logic lexicon at this point of analysis was to ascertain how participants' wisdom experience corresponded with the leadership perspectives set forth by Torbert & Herdman-Barker (2013). Torbert's latest model, The Global Leadership Profile was not yet available at the time this study was conducted.

This second level of analysis indicated that it was much easier to map the conventional level responses across one, two, or even three action logics. In most instances, these responses mapped either one level below or beyond the respondents' center of gravity score. Participants who scored at the later post-conventional action logics, however, expressed more complex responses that mapped across 3-4 levels. For several, these responses were even two stages beyond their center of gravity score.

This element of the study is indicative of the ebb and flow of human development and the "pull' toward later action logics. Participants who scored within the later action logics more specifically indicated a movement and transition toward a deeper understanding of self and the ability to more fully self-integrate into frameworks beyond their center of gravity. This aspect of the analysis was important in that it pointed to a possible relationship between how participants mapped across multiple stages of development and how they might experience wisdom within the integrated domains of wisdom.

The Integrative Domains of Wisdom

The results of this study did not indicate a significant relationship between the integrative domains of the cognitive, reflective, and affective aspects of personality and how participants experience wisdom. Additionally, there was no significant relationship between participants' adult stage of development and how they experienced the domains of wisdom. The significance of these two findings will be more fully explicated in the following discussion.

Summary of Key Findings

Key findings of the overall study suggest that wisdom can be experienced and expressed in both the single and integrated domains of wisdom. Participants from every level of development expressed responses that correspond to one or more domains. The integration of all three domains is difficult to measure because cognition is so closely related to the domain of reflection. This study can only point to what each participant revealed about their reflective processes. This factor presents a limitation to the study in that there is no way to fully determine how, if at all, participants access the reflective domain to include the full integrative domains of wisdom as defined in this study. One can cognitively experience wisdom in the moral decision-making process as readily as one can access wisdom in moments of deep introspection which may ultimately lead to deeper and more meaningful experiences of life and conduct toward others. The integrated domains are not necessarily accessed by an individual all the time. Sternberg (1985; 1998; 2004) reminds us that even wise individuals are not always wise. One can be wise in a variety of situations and in a variety of ways.

With respect to stage development theory, Appendix A indicates that wisdom can be experienced within multiple stages of development. For example, an individual who measures within the 3.5 range may experience the cognitive/affective domain of wisdom at 48% just as readily as a participant who measures within the 4.5 range does at 49%. The literature suggests that wisdom occurs more readily at the later stages of development because individuals at these later stages have a greater propensity to engage in thought processes or “empty mind” experiences that allow for more complex perspectives such as a deeper understanding of self in relation to the world and systems-at-large (Cook-Greuter, 2005). This overriding premise suggests that developmental movement includes a movement toward wisdom that involves increasing balance between differentiation and integration.

While the literature clearly points to the deep and profound meaning-making systems of individuals at these later stages, it is not clearly identified with any specific definition of wisdom. The study-at-hand, however, has analyzed a small, yet specific population of leaders within the context of the integrative domains of wisdom, and findings suggest that wisdom can and does occur within multiple stages of adult development. .

In conclusion, key findings indicated that:

- Wisdom can be experienced at both the conventional and post-conventional levels of development.
- Wisdom can be experienced within one or more of the multidimensional domains of the cognitive, reflective, and affective aspects of personality.

Discussion

Findings of the present study suggest that the complexity of wisdom necessitates inquiry into the lines of human development to include the integral perspectives associated with spiritual, emotional, and psychosocial measures because stage development theory, while vital to our understanding of human development, offers a limited understanding of how leaders experience wisdom. Further, the cognitive, reflective, and affective domains of personality may be influenced or affected by an individual’s spiritual, emotional, and psychosocial lines of development. Finally, the relationship between lines, states, and stages of adult development in the context of wisdom can provide a deeper understanding of how leaders effectively engage in behaviors associated with wisdom.

Before discussion on the reasons for these contentions, it is important to reiterate that participant responses associated with this study are but one aspect of how leaders construct meaning of their wisdom experience. While there is some indication that several of the participants (6/12) indicate more cognitive responses, it is presumptive to conclude that responses at another point in time would not indicate more integrated perspectives. Even within the more cognitive stance, participants indicate an ability to respond to people, life situations, and the overall pragmatics of life with wisdom. The participants in this study make good decisions based on a strong moral code of ethics, demonstrate empathy and compassion towards others, and exhibit positive responses to adversity. How they reflect and make meaning of those situations may extend beyond the cognitive responses offered in this study; this study is limited to responses of a small sample population at one given point in time. Additionally, it must be noted that this study does not represent participants from the later stages of development, namely, 5.0 and beyond. It is possible that participants who measure at these later stages may indicate a greater propensity for the more integrated domains of wisdom.

Constructive-Developmental Theory and How Leaders Experience Wisdom

My first contention that stage development theory offers a limited understanding of how leaders experience wisdom can be substantiated in two specific ways:

- Depending on the operationalized definition of wisdom, progression in human development may or may not coincide with progression in wisdom development.
- Based on the findings of this study, wisdom can be experienced at both the conventional and post-conventional levels of development.

With respect to this first contention, the underlying premise for this study was based on research in constructive-developmental theory that indicates that later stages of development correspond to higher levels of wisdom. As one transitions to later stages of development, higher levels of wisdom emerge (Barbuto & Millard, 2012; Cook-Greuter, 2005).

In an overview of Kegan’s Orders of Consciousness, Barbuto & Millard (2012) offer a significant perspective on the relationship between the stages of development and how such development coincides with a progression in wisdom. In this synopsis, the highest order of development corresponds to wisdom via an individual’s awareness of self-limitations and openness to the complexity of issues, the ability to connect multiple perspectives, and a willingness to adapt to the uncertainty of life. Other leading constructive-developmental theorists indicate that higher levels of differentiation and integration within the post-conventional stages indicate higher levels of wisdom (Cook-Greuter, 2005). Additional empirical studies (Yang, 2008a, 2008b, 2009, 2011) proposes a process view of wisdom arguing that when leaders exert positive influence to promote good lives for themselves, members of their organization, and society in general, wisdom is displayed through their leadership. Wisdom is therefore viewed as a positive real-life process that encompasses core competencies of cognitive integration, a vision for a good life, and the action required to embody that integrated thought and the positive effects of the action on self and others (Yang, 2011). As one of the most recognized constructive-developmental theorists in the field of leadership, Torbert, et al., (2004) views wisdom as an ongoing integration of 1st, 2nd, and 3rd person inquiry in the midst of action with others. Such wisdom involves the integration of being, knowing, doing, and effecting in a timely manner.

While each of these theorists point to the relationship between constructive-developmental theory and wisdom, the findings of this study suggests that the relationship between adult development and how leaders progress in wisdom may be more complex than previously understood. Based on review of the literature on constructive-developmental theory at the outset of this study, it was anticipated that leaders who measured at the earlier stages of development would fail to indicate integrated responses within the three domains of wisdom. However, when the results of the SCTi-Map scores were revealed, a surprising result emerged. Leaders who measured at the conventional and post-conventional stages, as demonstrated in Appendix A, indicated integrated responses within the primary domains of wisdom, e.g., the Cognitive/Affective and the Cognitive/Reflective. These slight, but important differentiations in the data, point to the complexity of human development in relation to the multidimensional aspects of wisdom and indicate that progression in human development may or may not equate to a progression in wisdom development, again, depending on the operationalized definition of wisdom. Without further inquiry into the spiritual, emotional, and psychosocial lines of development, it may be presumptuous to assume that progression in stages of development equate to a progression in wisdom.

Additionally, findings also suggest that it cannot be presumed that leaders who measure at later stages of development experience wisdom more readily than those at the earlier stages. For example, Participate 1 who measured at the lowest SCTi-Map conventional score indicated 48% of his responses in the primary domain of the Cognitive/Affective. However, with 33% of his responses falling within the Cognitive/Reflective/Affective domains of wisdom, he was also the only participant to indicate integration in all three domains (Appendix A). Constructive-developmental theory would suggest that someone who measures at this level might experience wisdom purely from a cognitive level that relies on external norms and standards and an express level of expertise from external sources (Barbuto & Millard, 2012). While it is difficult to ascertain the nuances of these measures within a small sample population, in-depth thematic analysis suggests that additional lines of development that might include spiritual and emotional perspectives are worthy of consideration.

The Integrative Domains of Wisdom and How Leaders Experience Wisdom

My second contention that the cognitive, reflective, and affective domains of wisdom may be influenced or affected by an individual's spiritual, emotional, and psychosocial lines of development is exemplified by the fact that participants indicated responses within one or more multiple domains of wisdom.

Research indicates that respondents who scored high on cognition utilizing the 3DWS (Three Dimensional Wisdom Scale; Ardelt, 2003) also scored high on the reflective and affective domains of wisdom (Ardelt, 2004b). Wisdom is therefore described as the integration of these three dimensional personality characteristics (Ardelt, 2004a; 2004b). The reflective component is emphasized as an important aspect of wisdom (Ardelt (2000, 2004a, 2004b).

Table 3 indicates the average percentages of the overall categorical responses in each domain in relation to the stages/action logics represented in the study. None of the three representative stages indicate a high percentage in the integrative cognitive/reflective/affective domain. However, participants' responses do indicate percentages within the multiple domains of cognitive/reflective and cognitive/affective.

Table 3: Wisdom Domains and Action Logics.

Action Logic	No. of Participants	Average Percentages In Integrative Domains			
		C	C/R	C/A	C/R/A
Expertise	3	34%	21%	30%	15%
Achievement	5	57%	14%	23%	3%
Values Oriented	4	37%	15%	37%	10%

Note: The categorical domains are represented as Cognitive, Cognitive/Reflective, Cognitive/Affective, and Cognitive/Reflective/Affective (Ardelt, 2000) and are based on data code sets.

Table 3 further indicates that participants within the Expertise, Achievement, and Values-Oriented action logics had lower response rates in the Cognitive/Reflective domain. Research on constructive-developmental theory points to the probability that people who score in the later stages of development, 5.0 and above, might have a greater propensity for higher levels of self-awareness and reflective engagement (Barbuto & Millard, 2012; Cook-Greuter, 2005; Torbert & Herdman-Barker, 2013); they might therefore experience more significant levels of wisdom based on their integration of all three domains. One of the limitations of this study is that none of the 12 participants assessed within these later stages of development. For more detailed exemplars of how participants experienced wisdom within the domains of wisdom, see Spano (2013).

Findings suggest that the three-dimensional domains of wisdom are present in the meaning-making systems of these participants albeit in different forms. For example, those participants who measured at the 4.5 range indicated an average percentage range (37%) in the cognitive domain that is not too dissimilar from that expressed by the those who scored within the 3.5 range at 34%. While this percentage is balanced with their cognitive-affective domain (37%), it cannot be presumed that their wisdom experience is more integrated than those who scored within the 3.5 range and indicated a higher percentage rate of 15% in the cognitive/reflective/affective domain. However, even this percentage in the integrated domain as expressed by the Expertise level is skewed due to the high 33% responses of Participate 1. Appendix A indicates that two of the participants actually scored higher in the cognitive domain. These differentiations in percentages point to the complexity of this construct and further suggest that wisdom can be experienced within the single and integrated domains of wisdom.

One of the most comprehensive studies on wisdom in recent years exemplifies the many complex nuances of wisdom as a construct. In examining exemplars of wisdom, Krafcik (2011) points to the significance of inquiry into the spiritual, emotional, and psychosocial lines of development. His study involves quantitative and qualitative measurements of exemplars' perceived levels of stress, life satisfaction, state and trait anxiety, personality traits, generativity, mindfulness, humility, ego development, spiritual perspectives, and potential for subclinical narcissism. As Krafcik hypothesized, exemplars indicated adult development scores that exceeded the highest conventional stage of 4.0; the study did not include exemplars within the earlier stages of development.

Additionally, one pertinent result of the Krafcik study indicated that among exemplars of wisdom, spirituality exceeded the normative score on the Spiritual Perspective Scale by 15.7%. Spirituality, as its own line of development (Wilber, 2006), is important to our understanding of wisdom (Ardelt, 2004; Kramer, 1990).

One of the limitations of the present study (Spano, 2013) is that, without a measurement of perspectives on spirituality, it is difficult to ascertain how the cognitive, reflective, and affective domains of wisdom are affected by participants' spiritual development. This line of reasoning can be further explicated in a third contention as follows.

States, Stages and Lines of Development

Finally, the third contention is that the relationship between lines, states, and stages of adult development in the context of wisdom can provide a deeper understanding of how leaders effectively engage in behaviors associated with wisdom. The findings of the present study suggest that without analysis of the complex interrelationship between states of consciousness and stages and lines of development, it is challenging to determine precisely how leaders experience wisdom. Stages and states of consciousness overlap in complex ways. A leader may experience a peak mental state within any stage; this state is interpreted based on his or her current stage of development (Wilber, 2006). The interrelationship between states, stages, and lines of development produces a variety of interpretative experiences that may or may not result in the experience of wisdom.

This relationship between states, stages, and lines of development was more significantly realized as the present study unfolded. Findings indicated that participants each had access to a moral code of ethics as their source of wisdom. This moral code of ethics evolved from positive and meaningful experiences with mentors early in their career paths and from societal and family norms over time. With the exception of one self-declared atheist, each participant expressed some level of spiritual or religious understanding. Several participants were selected for the study because they are known to be wise spiritual leaders in their community. Participants described behaviors often associated with higher levels of spiritual development, e.g., consistent acts of prayer and meditation, acts of generosity and benevolence, compassion, empathy, a deep and profound belief in something beyond self, an abiding love for others, and so forth. Two of the pastors from an evangelical mega-church, for example, were interviewed because of their philosophical and spiritual perspectives on the meaning of life and their ability to impact global societies. Findings indicated, however, that both of these participants scored in the 4.0 range and that they experience wisdom within the primary domain of the cognitive (Appendix A).

Krafcik (2011) indicates that an individual's state of spiritual development can override their stage of development. Such nuances add to the complexity of human development. For example, in contrast to the 4.0 scores of the two spiritual leaders, it is worth noting that the self-professed atheist scored at the later 4.5 stage with 49% of her responses in the Cognitive/Affective domain. States of consciousness represent the space in which developmental lines arise (Wilber, 2006). Depending on the different states of consciousness, developmental lines increase in complexity. Research that examines how these interconnections relate to wisdom can also prove invaluable in determining how leaders transition from early to later stages of development and how they experience wisdom. For example, the male Hindu participant in this study who measured at a post-conventional level expressed a higher state of consciousness via his daily meditative practices. Exploration into how such individuals' lines of development are affected by such higher states could be useful to our understanding of how leaders' experience wisdom.

These findings are significant when interpreted through the lens of recent research that indicates that exemplars of wisdom do not recommend one spiritual path (Krafcik, 2011). Such differentiations point to the importance of further inquiry into the spiritual, emotional, and psychosocial lines of human development.

Stages and lines of development as positioned within the framework of constructive-developmental theory are relevant to the field of leadership in that organizational leaders preparing to meet today's challenges would be wise to consider the relationship between the overall system and the entire leadership practice, to include the leader's consciousness or stage of development, his behavior, and the domains of culture (Kübers & Weibler, 2008). The results of this study indicate the potential for additional research that explores wisdom in the context of both adult lines *and* stages of development to determine if specific correlations do exist.

Limitations to the Study

This section identifies the limitations and delimitations of the present study to include aspects of the research design, sample size, sampling procedure, instrumentation, and researcher bias.

Sample Size

As is appropriate for a qualitative study that examines the in-depth first- person experience of participants, the sample size was limited to 12 participants. This sample size is not sufficient for generalizations about the wisdom experience of executive leaders or the overall population. It is sufficient, however, to generate perspectives on how conventional and post-conventional executive leaders experience wisdom in the course of their daily lives. It may also help define future research questions and methodologies in the field of leadership, wisdom, and constructive-developmental theory.

Sample Procedure

The sampling procedure created some limitations. Despite the desire to include participants from a variety of geographical areas, the researcher's national database now includes individuals who have transitioned outside of leadership roles due to the recent economic crisis. Despite outreach to over 26 leaders, 10 respondents are key leaders in one geographical area. Another limiting factor was the decision to include two leaders from the same mega-church. This decision, however, was predicated on the unique aspects of this organization as a global entity and the fact that both leaders represent entirely different roles at a local and global level.

Sample Population

The sample population includes 4 women and 8 men. While every effort was made to equally balance the gender factor, it was challenging to find executive-level women who were available to participate. Since women are still only 40% of the executive population, the researcher's data base includes a greater number of male leaders. Even though the study includes fewer women participants, it is worth noting that three of the executive-women scored at the 4.5 post-conventional level of development. This aspect of the study is interesting in that it posits the need for future gender based research that examines the differences between the wisdom experience of leaders from earlier and later stages of development.

Age was another factor of limitation in that many organizational settings include executive leaders in more seasoned stages of life (e.g., 40s and beyond.) The researcher did not have access to younger executive leaders who may be rising up in other fields, e.g., technology.

It should also be noted that the sample population criterion defined as "executive leaders," is limiting to the study. This specific limit responds to leaders whom, by the very nature of their status and role, may have greater capacity for wisdom. By focusing on this specific population, the study excludes responses from individuals in subordinate positions who might add to existing literature on wisdom and adult human development.

Another limiting aspect of the study involves the participants' stages of adult development. The SCTi-Map scores of the participants in this study indicated responses in the 3.5 stage to the 4.5 stage of development. Because it is somewhat difficult to locate participants in the later stages, more particularly within the corporate environment, the study excludes the wisdom experience of individuals who might score in these later stages. This factor presents a limitation to the study in that individuals who score within the later stages of 5.0 and beyond might offer a different perspective on how leaders experience wisdom within the integrative domains of wisdom.

Additionally, the study is designed to examine the interview responses of participants. This methodology presents a limitation to the study in that all data are self-reported and do not include third-party observations or other data points beyond the SCTi-Map scores. This factor points to the potential for participant self-bias and any proclivity to state their experiences from an subjective stance.

Instrumentation

The SCTi-Map assessment instrument has been rigorously validated through the work of Cook-Greuter (1999) and Torbert (1987, 2004). However, it is but one instrument that proffers one perspective of human development on an individual at a specific point in time. Additional instrumentation that measures and evaluates the construct of wisdom would also have been valuable to this study, e.g., the Three Dimensional Wisdom Scale (Ardelt, 2003).

Researcher Bias

All participants were selected via the researcher's data base or via nomination from a mutual colleague. Every precaution was taken to avert potential bias via analytic memos and journaling. However, the study may have benefited more from a nomination process that allowed for involvement from participants completely unknown to the researcher.

Implications of the Study

The purpose of this study was to elicit the wisdom experience of conventional and post-conventional executive leaders and to determine whether and how this experience related to the leaders' stage of development.

Implications for Leadership Development and Theory

Any expressed linkage between how leaders experience wisdom and their adult stage of development can be meaningful to future leadership development processes. The results of this study do not offer a significant relationship between conventional and post-conventional stages of development and the participants' experience of wisdom; however, the findings are nonetheless meaningful because they suggest that leaders at both stages have the potential to live out the experience of wisdom in ways that positively impact the organization. They are also significant in that leaders who come to understand their own experience of wisdom in the context of their stage of development have the potential to access higher levels of both wisdom and developmental movement. Leadership development processes that encompass aspects of stage development theory and wisdom theory could prove beneficial to the overall effectiveness of leaders.

Implications for Wisdom and Constructive-Developmental Theory

Wisdom Theory

The underlying premise of this study is that wisdom is vital to our understanding of self in relation to the world. How we respond to situations and people is dependent on our ability to exercise wisdom. Wise leaders are better equipped to handle the complexities of our global society.

This study is but one whisper in a large and still emerging conversation. Scholar/practitioners are only beginning to explore how wisdom can potentially impact leadership capacity and overall organizational development. The rapid changes in our society alert us to the fact that we must come to a better understanding of what it means to develop leaders beyond skills and competence. More comprehensive models of leadership that specifically align theory and practice are required. Scholar/practitioners can aid in these symbiotic efforts by "facilitating a more approximate fit between organizational context and the strategies and design of leadership interventions" (Zaccaro & Horn, 2003, p. 774).

The results of the present study suggest the importance of a leader's strong moral code of ethics as a source of wisdom. Somehow, in the midst of our chaotic environment, leaders must find ways to think and behave in more ethical and moral ways. The wisdom experienced and expressed by the executive leaders in this study represents a bridge between wisdom, leadership, and constructive-developmental theory. Implications of this study suggest that research must and should extend beyond the existing conversations of expert knowledge and the integrative aspects of wisdom to include the spiritual, emotional, moral, and interpersonal lines of development. Wise leadership is now becoming more critical to the future of our organizations, our environment, and our international societies. If we are to move leadership beyond the hierarchal model of authoritative power, control, and bottom-line results, we must come to understand what it means to live from value based perspectives that generate results for the greater and common good.

Wisdom theory, while still somewhat new as a psychological construct, demands that we access the hearts and minds of leaders such as the participants of this study[2] so that we can more clearly define that which they themselves take for granted: their unique ability to solve real-world problems in real time based on their own humble capacity to do that which is right and just – maybe not all of the time, but at the very least, much of the time.

Constructive-Developmental Theory

Research and application of constructive-developmental theory continues to expand in the field of human and organizational development. The relationship between adult stages of development and wisdom represents a non-linear, spiral effect, meaning that whether wisdom or higher stages of development occur first is difficult to surmise.

Findings of the present study suggest the potentiality for a reciprocal relationship between these two constructs. Several themes are consistent between the two constructs: (a) the inclusion of the cognitive, affective, and social elements; (b) the developmental nature of both constructs; (c) the increased ability to deal with complexity; (d) the ability to be self-aware and reflective; and (e) the impact of challenging situations and dissonant events to trigger further development (Barbuto & Millard, 2012).

The significance of the present study is that it expands upon these conclusions by exploring the nuances and differentiations in how participants experience the *integrative* domains of wisdom. Findings suggest that the wisdom experience of these 12 participants, while unique to each individual, does not necessarily correspond to their stage of development. Due to the complex and multidimensional nature of both wisdom and adult stages of development, more research is needed before scholar/practitioners can unequivocally propose that the integrative domains of wisdom directly correspond to stages of development.

---

[2] For rich descriptions of participants of this study, see Spano (2013).

Implications for Future Research

The relationship between a leader's propensity for wisdom and his/her adult stage of development has profound implications for leadership development (Barbuto & Millard, 2012). Future research should be intentionally designed to advance developmental processes in both areas as follows:

The Leader/Stakeholder Relationship

Responsible leadership and stakeholder theory expands the leader/follower relationship to include key stakeholders (Maak & Pless, 2006). Executive leaders who are interacting with multiple individuals within a variety of contexts will be better equipped to do so if they have developed a greater understanding of their stage of development and how, if at all, that level equates to their capacity for wisdom.

The participants of this study indicated that how they experienced their wise mentors impacted how they came to develop their own moral code of ethics and their own capacity for leadership. Much of the integration between their moral code and their leadership capacity occurred at a subconscious level. It wasn't until the participants had an opportunity to recall their memories that they came to fully realize the impact of this wise mentor on their lives. Most often, they were surprised to notice that they had come to emulate much of what they had experienced in this leader.

This finding has significant implications for research that involves the mentoring capacity of leaders. How leaders come to understand and explore their moral code and how they live it out in the day-to-day practicum of leadership could prove important to the leader/stakeholder relationship. Leaders have the potential to foster wisdom in their followers (Barbuto & Millard, 2012). Awareness of their own developmental stage and how their meaning-making systems impact their ability to effectively live out their role of leadership can potentially impact their capacity to influence the leader-follower relationship in positive ways.

Differentiation of Target Audiences

The present study was designed to include executive leaders from diverse backgrounds. Greater emphasis was placed on the leadership capacity of the individual, however, than it was on their industry or the industry's role within society.

The relationship between the two constructs may be more expressly researched in terms of industry and/or disciplines. For example, findings suggest that those in the more analytical fields (engineer, attorney) may experience wisdom differently than those in the more humanistic fields of religion or social administration. Additionally, there was an apparent difference between the wisdom experience of leaders in corporate environments and those who exercise authority in not-for-profit organizations.

Finally, research into the wisdom experience of women leaders vs. men leaders would also prove invaluable. The study pointed to some interesting differences in the way women recalled their experience of adversity and the wisdom gained versus that of their male counterparts. The women were far more straightforward in describing their experience whereas 4/8 male participants were very emotional in describing their adversity and what they learned from that experience. Even as they expressed emotion, the four male participants spoke to their need to be strong for others in these moments of loss. Literally caught off guard by their own emotions, it was as though the interview was the first time these men had spoken of their feelings on the matter. The women, however, expressed greater comfort and understanding of their story and how they came to resolution after a period of reflection.

Such nuances may suggest that women may have a greater propensity to move beyond the cognitive level of wisdom to the more integrative reflective and affective stances that equate to wisdom.

Additionally, this study focused on the wisdom experience of leaders who measured within the 3.5 range to the 4.5 range of development. Further research is needed to determine if leaders who measure within the earlier or later stages of development might experience wisdom more within the integrative domains of wisdom than findings of this study indicate.

The Spirituality of Wisdom

The relationship between the human experience of spirituality and wisdom is so complex that it warrants specific research in its own rite. The nature of business is transformed when viewed and experienced from a spiritual-based context (Delbecq in Miller & Miller, 2006). Delbecq further states that “one of the most striking features of the spiritual-based context for wisdom leadership is that the primary purpose of business and of wisdom leadership is spiritual fulfillment and service to society” (Miller & Miller, 2006, p. 9).

This study has encapsulated the leadership of these participants in the context of their moral code. For some, this moral code includes a high level of spirituality, but spirituality conjures up all kinds of definitions and experiences in the human mind. Based on findings associated with the Spiritual Perspective Scale, Krafcik (2011) indicates that higher levels of wisdom are correlated with increases in openness, humility, and the importance of spirituality. Future research that more clearly defines how spirituality impacts a leader’s propensity for wisdom could enhance meaningful life/work experiences for leaders.

From the perspective of constructive-development theory, spirituality presents even more complex dichotomies. For example, two of the leaders in this study are deeply spiritual men, yet, even so, they measured at the 4.0 conventional level of development. On the other hand, three of the leaders who measured at the 4.5 post-conventional level professed no specific spiritual beliefs or practices.

Wisdom and Differentiation-and-Integration

The experience of wisdom within the context of stage development theory may be more significantly understood through the lens of differentiation and integration than through the integrative aspects of existing wisdom theories. Development is defined as the purposeful transformation toward higher levels of simultaneous differentiation and integration (Cook-Greuter, 2005). Differentiation refers to an increased understanding of the specificity of concepts held in one's knowledge of the world (Zaccaro & Horn, 2003). Development and cognitive psychologists characterize the beginning of cognitive growth in terms of increased differentiation in schemas, knowledge structures, and ways of understanding (Kegan, l994; Piaget, 1954; Zaccaro & Horn, 2003). Integration refers to the understanding of assumptions (Cook-Greuter, 2004) and a linking of unrelated concepts through higher order abstraction (Zaccaro & Horn, 2003). Differentiation begins in the conventional stages of development and increases toward higher levels of integration at the post-conventional stages. While this study inadvertently explored the nuances of differentiation and integration, analysis was not intentionally pointed in this direction since the greater emphasis was placed on the integrated domains of wisdom.

Research that explores how leaders differentiate and integrate their experiences could be perhaps the most vital to our understanding of how leaders' experience of wisdom corresponds to their stage of development. Barbuto & Millard (2012) contend that the connection between constructive-developmental theory and wisdom could have profound implications for future leadership developmental processes and for wisdom development in followers.

Life Experience and Adversity

The interview protocol of this study was designed to elicit the meaning-making systems of participants via semi-structured, open-ended questions. While every participant expressed the viewpoint that wisdom comes from life experience, future research into the depth of such experiences could prove meaningful to our understanding of how individuals from all walks of life grow and develop their capacity for wisdom.

The literature clearly indicates that a person's capacity to positively maneuver through the many aspects of adversity may enhance one's capacity for wisdom (Ardelt, 2000). Adversity, however, is a broad and ambiguous construct within its own rite. This study was designed to elicit responses about wisdom in the context of adversity; however, adversity was not the sole focus of this body of work. Future research that deals more specifically with the many aspects of adversity would expand our understanding of wisdom. Specific areas worthy of consideration include how wisdom precisely correlates to life experience, how one learns from mistakes and poor life choices, how one acquires wisdom via the adversity of personal tragedy, or how one experiences wisdom from hazardous occupational settings or from being exposed to life-threatening conditions.

The StAGES Model

The more recent StAGES Model set forth by O'Fallon (2014) offers up a great opportunity for future research in that her extensive longitudinal studies have further delineated the Unitive/Ironist or 6.0 post-conventional stage of the earlier models. This body of research depicts three later stages more expressly described as Transpersonal (5.5), Universal (6.0), and Illumined (6.5).

The significance of this model lies in the fact that it synthesizes earlier ego development theory, the concrete, subtle, and causal tiers, and an understanding of later stages of development, all of which are embedded in the Integral Theory AQAL Model (Wilber, 1996, 2000, 2006).

In experiencing the many complex premises underlying the StAGES Model directly within the Pacific Integral Community, I found this particular model to offer a deep and profound understanding of the complexities of human development. Further research that explores the StAGES Model in conjunction with Wisdom Theory may prove instrumental in deepening our understanding of how leaders experience wisdom in the context of their internal, external, and collective worlds.

Conclusion

The study was designed to explore the wisdom experience of conventional and post-conventional leaders. The intention is to open scholar/practitioner discourse between three significant fields of research: leadership, wisdom, and constructive-developmental theory. While the aforementioned qualitative findings are interesting and meaningful, they suggest the need for additional research that explores wisdom in the context of both adult lines and adult stages of development to determine if specific correlations do exist. As with every academic endeavor, more questions arise than answers.

Recent shifts in the global economy and the many challenges associated with a networked society in the age of knowledge and information suggest the need for leaders who are self-reflective and self-aware. Additionally, today’s leaders must be capable of engaging in complex levels of differentiation and integration of multiple ideas and solutions. A hundred plus years of leadership theory points to a shift from early quantitative research on traits, behaviors, power and influence, leader-follower relationships, and situational theory (Yukl, 2010) – each emphasizing leadership effectiveness – to now include equal focus on qualitative research, to include cognition and perception, e.g., phenomenological studies (Bass, 2008).

Constructive-developmental theorists have offered a plethora of research that helps us understand how individuals construct meaning and how that meaning equates to effectiveness and overall positive outcomes. The many facets of wisdom have been explored and researched from a philosophical, theoretical, and psychological perspective since man began to ponder the meaning and significance of life. Each of these disciplines has contributed to our understanding of the human condition. While we have come to understand a great deal about how leaders construct meaning and how they may or may not engage in behaviors associated with wisdom, we still have a limited understanding of the relationship between those meaning-making systems and their states, stages, and lines of development.

At the outset of this study, I quietly presupposed that leaders who measured at the later stages of development would indicate a greater propensity for wisdom within the integrated domains of wisdom. Findings indicated otherwise. There was no significant relationship between participants’ stage of development and their propensity for wisdom. Leaders measured within the single and multiple domains of wisdom at both the conventional and post-conventional levels. The findings suggest that, depending on the operationalization and definition of wisdom, the progression in human development may or may not coincide with a progression in wisdom development.

The significance of these findings lies in my contention that wisdom, as a complex multidimensional construct, requires further inquiry into the spiritual, emotional, and psychosocial lines of human development. Exploration into the interrelationship between how a leader thinks and the possible underlying source of that meaning-making system, e.g., lines of spiritual or emotional development, is necessary if we are to more fully comprehend how leaders construct meaning and engage in behaviors associated with wisdom.

It would be easy to review the findings of this study and reduce them to a cliché about the essence of leadership or what it really means to embody wisdom. Halfway through the process of analysis, I found myself asking, what does it matter, after all, if a small select group of leaders presented themselves not as perfect, but as experienced, good solid individuals who were engaged in purposeful work? So what? Would these findings add anything to that which we already know? As the data began to reveal a group of leaders who exhibited focus, passion, and an overall desire to do the right thing, my thoughts deepened.

As a society, we anticipate the promise of good leadership. Unfortunately our daily experience with corporate debacles and Wall Street narcissists alerts us to the dangers of leadership gone awry. How do we do that which is right and just when up against deceitfulness, deadlines, and the unscrupulous and egocentric behavior of others? How do we create positive results in our personal and professional lives with those who are at different stages of development than ourselves? With those who may be more or less wise?

The significance of this study goes beyond the findings of any first-or- second-cycle of analysis. The significance lies in the hearts and minds of 12 executive leaders who dared to share their stories. Among the global chaos that has enveloped much of our society, they offer the promise that leaders can and do cultivate wisdom; they can do that which is right and just for the greater good of all. Extensive and repeated qualitative analysis of their transcripts, their voices, offers unique perspectives on wisdom than cannot be captured via statistical data alone. These leaders represent all that is possible for every leader, every society. Each of these leaders has described an ability to actively cope with adversity and this ability to cope has moved them to significant levels of understanding about themselves and others. They exercise wise acts of leadership not because they should but because it is who they are. They get up each day, passionate about the work they do, and they make the hard choices. And in the midst of all their challenges and frustrations, they do their best and hope that it is good enough. Each leader, from the early conventional level of 3.5 to the later post-conventional stage of 4.5 indicated an ability to be selfless and self-aware. For them, wisdom represents a quest to reach our highest potential. But this quest is quiet, unheralded by the things we accomplish. It is less about what we do and more about whom we become along this journey called life.

In the grand and vast valley between theories, this study fills a small but meaningful gap. It serves to remind us that no matter the horror of the evening news, the goodness of leaders such as these will prevail. As scholar/practitioners, it is why we do the work we do. It is why leadership matters.

11	4/5	Values	Technology Consultant	24%	37%	15%	22%	C/R
12	4/5	Values	President/Advocate	26%	11%	46%	15%	C/A

Note: Percentages are based on number of overall responses in cognitive, reflective, and affective domains of wisdom.

A Brief Overview of From Wisdom Related Knowledge to Wise Acts: Refashioning the Conception of Wisdom to Improve our Chances of Becoming Wiser

Jonathan Reams[1]

This brief overview is intended to accompany the interview with Jonathan Rowson also in this special issue of Integral Review. Written in 2008, Jonathan's dissertation provides an example of observing an integral mind at work. Reading through the it one cannot help but be aware of the easy, flowing nature of how Jonathan's mind is able to integrate a wide range of fields of inquiry, models, positions within academic and societal relevance and discourse while somehow making it easy to read.

The dissertation begins with a very personal introduction on why the topic of wisdom and how it is important to become part of the problem in order to become part of the solution. This is a counterintuitive phrase he attributes to Bill Torbert and it equates to the notion that unless you have a lived experience of a certain kind of challenge, and participate in the world, it's very challenging to understand how the problems, as Kegan and Lahey say, can 'solve us.' In that sense Jonathan approaches the topic of wisdom as a personal problem of learning to become wiser as well as understanding the social and political needs for wisdom in society today.

The dissertation is divided into four parts making up ten chapters. The first part is looking at wisdom research itself. It begins with a traditional literature review which takes us through an array of works by researchers from the major schools of thought as well as outside them in the field of wisdom literature. From this review you see a number of themes beginning to appear. There is something of a relationship between spiritual intelligence and needs and wisdom. There is something to do with this notion from Francisco Varela of the virtuality of self that is somehow related to wisdom. There's a distinction made between wisdom as a general personality characteristic and the notion of wise acting.

Our relationship to wisdom is also linked to the notion of catching ourselves in the act of self-deception. In this way, Jonathan positions wisdom as a form of transformative learning, a theme he comes back to a number of times. In reviewing this array of literature and research on wisdom

he perceives that the main challenge is that wisdom is a premodern idea relying on the tools of modernity to fit a postmodern world.

It is this kind of challenge of wisdom as a concept or phenomenon that in some ways we can all recognize when we see it, or at least have a felt sense of recognition and resonance for it, and yet it's almost impossible to define. In fact, later on Jonathan says that to define wisdom is unwise.

The second chapter looks at the problem of why it's so difficult to approach the word wisdom in a wise way, and that this notion of indefinitely defining wisdom is in itself problematic. To deal with this Jonathan looks at wisdom as a finite province of meaning, as a meme and even as a koan. This approach of trying to understand why it is so challenging to define or even discuss wisdom is the nub of this chapter. We encounter the reality of this challenge in that the very act of naming and positioning this difficulty is to step to the margins of what is considered appropriate for doing an academic intellectual project in relation to something that doesn't really fit in that modality.

In the third chapter Jonathan moves into a description of how he did his research. While not what one would consider a traditional methodology chapter, it does serve this function as he describes the first, second and third person notions of awareness, appreciation and appraisal that he utilized in this work. It's very clear that there is a strong heuristic orientation of observing his mind at work in relation to the topic. To illustrate this he uses a story from his time as a chess player (where he was three years in a row the British Chess Champion). He utilized his ability to observe the different phenomena arising in his mind as a metacognitive way of helping him understand possible distractions and/or blind alleys of thinking that can arise during a chess match. Applying this kind of metacognitive functioning to his own process of research is what gives this dissertation a light readable quality, where we feel we're going on this personal journey with Jonathan.

The second person part of the research constituted utilizing a number of stories that were considered to be descriptive of wisdom or wise acts in some form or another and to use those as a dialogue piece to have a number of other respondents read and give responses to whether or not they considered the stories exemplars of wisdom and, if so or if not, why or why not? This second person part of the research appears here and there throughout the dissertation but there is no traditional empirical findings section in relation to this. As well, the third person appraisal has a lot to do with taking a meta-theoretical approach to the existing theories and research around wisdom.

In part two, positioning wisdom, Jonathan addresses some of the challenges he faced in applying this approach to the topic. The first is talking about getting beyond a rationalistic neurosis in research. This involved describing the notion of bricolage as a general kind of meta-theoretical handyman approach to weaving through not only the landscape of wisdom literature, but also the philosophical and psychological issues involved in wisdom research.

He then takes a look in chapter five at human nature as bodies, brains and breakdowns and talks about embodied empathy and wisdom as transformation. Chapter six, *knowledge about* *wisdom requires wisdom about knowledge*, gets into the epistemological challenges that face doing this work and recognizes that knowledge is active and not just representational. Essentially this entails a need to stand back from and be as conscious and explicit as possible about the lenses and perspectives one is bringing into the work and how they create the particular perceptions available. In this there was an interesting relation to the work of Watzlawick, who talks about taking total responsibility in our lives, total personal responsibility, and how this action actually leads to total freedom. This was a very interesting chapter looking at epistemology and knowledge in relation to doing wisdom research.

Part three looks at a deeper understanding of wisdom, or at least moving towards it and in chapter seven unpacks the notion of transformative learning as the essence of wisdom. Jonathan sees wisdom as a confluence of experience, perspective and transformation. In this way he comes to the concept from Varela of the virtuality of self. He recognizes that as we go through transformative processes what we were once subject to or embedded in as an identity shifts to an object of reflection that we are no longer identified with. From this we start to see that the notion of self is actually much more fluid than we imagined; that change is natural in humans. From this he notices how Varela moves towards this notion of a virtuality of self, not as self being unreal, but as the self not being the ontological grounding of reality we often take it to be.

Chapter eight then builds on this and talks about seeing through the self; from being a self to having a self. This is captured by the notion that each of us as a self is a theory, or “each of us are a theory which is a self.” Somehow we ‘self spin’ imaginative events and create all sorts of distractions and dead ends for ourselves. The notion of expertise as knowledge is translated into first person experience of the virtuality of self and the transformative effect this is able to have on us.

Part four is about the challenge of becoming wiser. The first three parts lay out the field of wisdom and its research, what it is, where it is situated and why it is important. Part four looks at what is the path towards gaining wisdom? This is what Jonathan problematizes as the main challenge in the existing research on wisdom, that while it does a lot of descriptive work it does not do so much to try and explain to us how to move on a path towards becoming wiser.

To redress this, he draws on a number of pieces of work to look at some very specific issues related to what he calls the “psycho social battleground of wisdom” in chapter nine. These have to do with; the biological divisions we have constructed between mind and body, a notion of naïve realism that we already see things as they are and should be, and the notion of self-deception which we touched on earlier and is a very strong component of what seems to be a natural blockage on the road to wisdom. As well, the notion of a self-serving bias, that we already see our own change much more than we see it in others, as well as a negativity bias, group think and status anxiety are included in the list of issues Jonathan puts forward as impediments on the path to wisdom. In this sense, there are implications for pedagogy which are explored in the conclusion, with a sense of the importance of dissonance in cultivating wisdom as a step in the process of transformative learning.

Overall, this meta-theoretical heuristic journey through the landscape of literature, stories (third person as well as personal ones) and reflections on wisdom makes for very enjoyable reading. In my experience, after having been exposed to a lot of the literature reviewed on wisdom from earlier work, it is clear to me that the approach that Jonathan has taken enables the field of wisdom research to have a perspective on itself. There are new insights about wisdom, that in essence it is a transformative process about cultivating a sense of detachment from our identification as a self, realizing the virtuality of that self and yet utilizing the self in creating and cultivating the kind of habits of mind that will lead to spontaneous wise acts in the world.

Wisdom, Spirituality and the Virtuality of Self: An Interview with Jonathan Rowson

Jonathan Reams[1]

I had the good fortune of meeting Jonathan Rowson in the fall of 2013 at the offices of the RSA in London. I have also had the opportunity to read his Ph.D. thesis on *From Wisdom Related Knowledge to Wise Acts: Refashioning the Concept of Wisdom to Improve Our Chances of Becoming Wiser.* On my first reading of it, I felt like I had taken a journey, gently guided by a mind floating along a stream of intellectual thought, research, public opinion and more, somehow navigating his way through all of it in a way that opened new horizons of how wisdom can be conceived.

When undertaking this special issue, I wanted to find a way to include Jonathan's work. I didn't just want him to write an article based on his thesis, although that would have been nice. I managed to arrange for an interview, and have provided a brief set of reflections (also in this issue) on his thesis aiming to summarize it and entice readers into reading it for themselves.

The interview itself was stimulating, wide-ranging in scope, and heartfelt in the degree of personal engagement Jonathan brought to it. Reading the transcription for the process of ensuring accuracy and cleaning up things, I again found enthusiasm and energy rising. There was at times a real felt sense of tension in the conversation and in the lived experience it was describing, as we were drawn into enacting the qualities described to the best of our abilities. It is my and our hope that you enjoy listening in while reading.

Jonathan's current formal bio is as follows:

Dr Jonathan Rowson is Director of the Social Brain Centre at the RSA. After degrees spanning a range of social science disciplines from Oxford and Harvard, Jonathan's Doctoral research at the University of Bristol featured an analysis of the challenge of overcoming the psycho-social constraints that prevent people becoming 'wiser'. He writes for The Guardian's Behavioural Insights Blog, was formerly a columnist in the Herald, Scotland's national newspaper, has authored three books, and is a chess Grandmaster and former British Champion (2004–6). He recently authored: Spiritualise: Revitalising spirituality for 21st century challenges.

The interview took place on the morning of December 16th, with the aid of various technological mediations. Given that we have same first names and last initials, it was easiest to distinguish us by using last names.

SOME RIGHTS RESERVED

Reams: Jonathan, first thanks for taking the time to do this interview. I'll say I've thoroughly enjoyed reading and then re-reading your thesis: From Wisdom Related Knowledge to Wise Acts: Refashioning the Concept of Wisdom to Improve Our Chances of Becoming Wiser.

Rowson: Thank you.

Reams: My first question would be do you feel a little bit wiser from having done that?

Rowson: Well, I finished it about 6 years ago and I was motivated to finish it by the main thing distracting me at the time, which was the election of Obama. So it was November 2008 that I submitted it and I remember the lead up to it had this trade-off between the distractions of the American presidential election and actually writing the report. That's just to give people some historical context for how long ago it was.

Going through the process I don't think it would be right to say a resolute no, it hasn't made me any wiser, but nor would it be right to say yes. The truth is there's a connection between untangling one's thoughts about something and knowing what you're seeking in the world. There is something about that process of seeking that leads towards wisdom.

So although it doesn't in itself make you any wiser, it can be quite useful underlabor. For example, writing the thesis made it abundantly clear to me just how important practice was. There's a notion of experiencing and methodologically undergoing certain things to have a chance of being wiser when it matters. So in and of itself the writing does not create the wisdom. But it does create a way to unfold that might help you get there.

Reams: What kind of things are in tension with this? I know later in the thesis you describe moving from the positive description of the how, what and where of wisdom toward describing wise action. But then you also take a chapter to look at some of the things that, if this is so obvious, why don't people do it? What is your sense of that tension?

Rowson: Wisdom is a concept that invites a lot of folk understanding. It is part of our everyday lexicon and it is symbolized in songs and books and people have a certain implicit understanding of what is meant by wisdom.

What the thesis was about is on the one hand how adequate that folk conception is and what literatures are there to sense different ways of looking at wisdom. Then what do I as the writer and researcher think about all that? In that context it became clear to me when I think of the moments that I'm most moved by what seems to be something wise, when I'm struck by a certain receptive quality or empathetic quality or some ethical conviction that is somehow enacted; when I see those things coalesce in a particular moment I think: Wow, that's what I'm looking for. Whatever that was is a quality that I'm trying to unpack here.

Now what that means for means for me is a recognition that on the one hand such things can emerge spontaneously without prior preparation. But it's also clear there are barriers for that kind of presence of mind and heart in the right moment. And those barriers ears include the ego, they include self preoccupation, they include a lack of mental complexity to actually bring into one's own mind the perspectives of others and those things together are the kind of pathways you need to undertake so you have a greater chance of acting wisely; even if it doesn't in and of itself create the act and even if that act does not depend upon those prior forms of preparation.

There does seem to be quite a strong correlation between working on one's self, for instance through thinning the ego and gradually growing in our capacity for perspective taking, and growing in empathetic communion with others. The moment for wise action tends to arrive in situations that are socially and ethically complex; a an act or decision or even just a form of words, but being able to do the right thing as those conditions arise. These things – becoming wiser and acting wisely – do seem to be connected.

Reams: Right. Then that leads me to two different tracks I want to make note of here. One is that in your thesis you describe Robert Kegan's work and how moving towards a fifth order transformational mind rather than a self authoring mind seems to describe characteristics of that are very much aligned with what you just described in terms of being able to take multiple perspectives and integrate them and even have a perspective on your own perspective.

Yet in your thesis you also moved away from trying to base wisdom as being directly related to those later stages of cognitive development. Can you reflect on that for a moment?

Rowson: Ok. On the one hand you have these maps of post formal thinking sometimes described as adult development. Certain integral theories and some of these maps are very, very sophisticated, classically involving quadrants of different kinds, bringing in social and cultural influences, the relationships between interior and exterior aspects of consciousness, and so forth.

There are these models out there and they're mostly theoretical. Some of them have some empirical validation and others don't. So on the one hand you have all that rich and interesting intellectual stuff, and on the other hand you have the visceral, vivid felt sense of what it is to be in the presence of somebody wise, or to observe a wise action. Then the question becomes: How are these two things related, if at all?

Let me give a brief anecdote and come back to this question to contextualize it. A couple of days ago I was responsible for looking after five five-to-six year old children. It was an after school play date and I had to take them all home from school. I was the only person looking after them and, of course, with five young children and twenty young limbs it's difficult to keep track of what's going on.

There is a busy main road on the way home from the school. It's a short walk but it's slightly dangerous; a fairly dicey, slightly nervy situation when walking with five young kids. At one moment my son was getting quite distressed because I was trying to hold his hand while also trying to hold another child’s hand with the same left hand. He was getting distressed because he didn’t want to share and also he wasn’t that comfortable.

The girl who was holding his hand and mine as well looked at me and saw that there was a slight, well, she looked at my son and saw there was this problem and without saying anything she kind of smiled at me and crossed over past me and went to the other side and held the hand of another child and we carried on walking. And she gave me a little look as if to say: Is that better now?

Now that happened quietly and unobtrusively and I wouldn’t go so far as to say it was wise. It would feel like a stretch to call an act of a five year old wise but in that moment she picked up on a huge number of subtle cues as to what the correct course of action was.

I’m sure if you did a developmental study of this five year old you wouldn’t find anything like the kind of perspective taking qualities one would expect or need for wise action. But nonetheless, I wouldn’t want to say that there wasn’t an emergent, proto quality of wisdom in the kind of perception that she had.

I guess that’s the long way of saying I’m not locked into linking wisdom too closely to a particular developmental theoretical model because there is something beautiful about the freshness of a particular act by almost any kind of person in any given moment.

In contrast, not being fully ensconced in the world of integral theory but knowing enough of it; having read a fair amount of Wilber and Kegan and a few others, my feeling is that these concepts, if I stop being seduced by them intellectually and just stand back from my mind and stop finding these models so delicious and interesting, all these pathways and maps and terrains of how one can progress, and I just stand back for a minute, they all feel, well, a little *heavy*.

You know if I’m honest, the felt sense of these models is that, yes, they’re intellectually delicious, yes they speak to our experience in a quite a profound and illuminating way. But there is also a strong sense that they are ‘not it’. In the old Zen sense, they are the map not the territory, and while we need good maps there is something about the territory that gets lost when you fixate on them too much.

Reams: *It’s very interesting how you describe this. There are two distinctions I’d like to make in relation to that. One is that in this special issue where our interview will be published there are two other theses where the researchers looked at people who were nominated as wise from various criteria and even were scored on different measures of wisdom and were given ego development assessments. What they found in both of those is that there is not a strong correlation between late stages of cognitive development and wisdom.*

Rowson: Right! And that doesn’t hugely surprise me. We are in complex terrain here because it depends on how deep you want to go, but my mind is bringing forth various things. First, it’s the basic ontological question of; if wisdom is a feature of reality in what does it inhere? Does it inhere in a particular cognitive apparatus that could be unpacked in neural terms? Does it inhere into intersubjective complexity such as relations between minds, or perhaps between bodies in a given social cultural environmental context? Or is it somehow downloaded from above in some sort of divine or creative insight that is strictly unpredictable and uncontrollable?

I think most people would want to say it's a little bit of all of those things and also something about their coalescence. So I would imagine these developmental pathways might sometimes be necessary without having sufficient conditions inherent in them. But there's something very sweet, simple, almost innocent about wisdom that doesn't seem to require complexity of insight.

Reams: Let's look at that.

Rowson: This can apply in the situation like the one I mentioned and various others; a kind of visceral, slightly breathtaking quality of a simple grasp of what needs to be done in that moment, or a form of words that really connect deeply with somebody. And that's all true, as far as it goes.

But on the other hand, these developmental models are very important for pointing towards what it means to grow as a person. I think the idea that there is no connection between growth and wisdom would be pretty problematic because I think part of what we think of as wisdom is something that one grows into or acquires through experience.

Reams: Right. So there is something in what you're saying that I think might fit with the notion of two different distinctions. One is that we're talking about stage development and in a way we're talking about wisdom as a kind of general virtue of character that a person carries that enables them to be more likely to act wisely and not be hung up by their ego or a lack of empathy or whatever.

But we're also talking, I think, in your story about the five year old girl, about states and wise acting rather than a generic sense of wisdom.

Rowson: Yes and when you say states what do you mean exactly?

Reams: I'm just thinking that state experiences in integral theory, at least in Wilber's model, are related to temporary things. You can have a peak experience, a momentary insight of something.

Rowson: Okay so you're talking about states, streams and stages.

Reams: Yes.

Rowson: I know where you're coming from now. Yes that's right. I think it's Wilber who says these things are separate and need to be distinguished but they're not completely unrelated either. As I understand it, certain stages are more likely to give rise to certain states even if they don't strictly reside in them.

Reams: *Right. So I'm trying to weave a number of things from your thesis together here. We're in this place at the moment where we have this example of the five year old girl in a way doing some act that we could say has some characteristics of wisdom. We wouldn't call her a wise person necessarily but we could say she acted wisely in that context in that moment. She didn't pull a tantrum or whatever.*

Rowson: Yes.

Reams: *You also talk later on in your thesis, and I want to get into this more later, but as a way to introduce it now, you talk about Francisco Varela and the notion of the virtuality of self.*

Rowson: Yes.

Reams: *I have this image suddenly when you're describing this girl and we're talking about states as opposed to stages and wise acting, that there is some way in which this virtuality of self leaks through a person and enacts itself in some act that people look and say that was wise. Does that make sense?*

Rowson: Yes it does. This virtuality of self idea needs a little unpacking. Most people who will be reading this probably know this broad domain, and will immediately associate it with Buddhism and the concept of annata or no-self. It is closely related to that. It's a fundamental insight that also goes back to people like David Hume and the Western tradition, many who recognized that if you examine your spirit closely there is no essential self or ego to be found. There are mainly fragments of experiences and thoughts that pass, but no particular sense or locus around which these arrive.

Varela has a nice expression for this. He says, "There's no landing platform for experience," which for me was quite an evocative way of putting it. If you imagine experience as the thing we experience, the thing that's going on in our psyches, there isn't a place where that settles. There is no self to bring that contingent flux into its bosom. There is just this experience that's going around.

Of course, in models like Kegan's you'll see that you have self authorship and have a sort of self locus to make sense of that experience, and structure and order and make judgments about it and so forth. But I think nonetheless the more deeply one goes into certain meditative practices the more you can see that yes, there isn't really an essential self. However, that's not to say the idea that there is no such thing as a self actually makes any sense! Because clearly that's how we experience the world, and the self has a lot of functional social and cultural relevance. It's an integral part of how we relate to other people and make sense of the world.

Again, we're in one of these paradoxes or contradictions where you want to say simultaneously the self is extremely real and very much at the center of our lives, but also fundamentally unreal. And the term "virtuality" that Varela uses I found quite helpful for that because, we know virtuality through the virtual which we often describe as the internet, forms of the internet. But virtuality also gets at the notion of fragility and not quite being real as well.

So to speak of the self as being virtual is to acknowledge simultaneously that it's not what we assume it to be in everyday life, but equally that it's not completely non-existent.

Reams: I know late in the thesis you do have this discussion in relation to the virtuality of self, of what is the self in that sense. The phrase that comes to mind for me is that there is some "domain of validity" in which the self as a construct and a way of organizing experience seems to be appropriate and useful. Then you're pointing to a domain of validity that may have a lot to do with wisdom where it may get in the way and be a limiting construct.

Rowson: Yes, I think that's a good way of looking at it. I think you can be completely subject to the self and then you can recognize the self and the various stages beyond that, many of which I have no first person access to. What Varela argues is that he's talking about ethical know-how which is not quite the same as wisdom. But it's wonderful - he talks about certain examples of what it would mean to act with virtue in a given situation.

Varela says the capacity to do that is directly related to the progressive ability to experience this virtuality of self and know it from the inside. To know at some level there's nothing to hold onto. You don't have to be attached to your identity or your desires in a way that prevents you from acting well.

Again, this is a slightly more vernacular popular example. To slightly jump a little bit, in the report that is about to come out [this is referring to a report for the RSA Jonathan has written, and which can be found here] about spirituality I distinguish between self and soul, and this might be quite useful for this point. When you're at a dance and you're a relatively shy introverted person or just someone who doesn't really want to be too flamboyant in your movements, you often are on the edge of the dance floor and feel a little bit inhibitive and say: "I don't dance. I like to write papers and go to conferences" and so on. But you also know at some level that you'd be a lot better off if you just let go and got on the dance floor.

The qualities of inhibition and self preservation and identity construction that are preventing you from dancing are part of the same type of problems that might prevent you from really seeing what another needs, really hearing and really sensing what's going on in a given situation.

Whereas the part of you that just says "let's go" and says that reputation, that sense of self, that sort of limited conception of who I am doesn't really matter that much, and then you go dance. You find then after 30 seconds or so of self consciousness you find you're in this much more free liberated state where you can enjoy yourself. It feels truer to who you are as well. It's closer to reality.

Reams: Right. You talk about openness to experience, which is one of the "big five" psychological constructs researchers have found to be empirically valid. This openness to experience has something to do with accessing the more authentic self, but you're also going to make the distinction then between self and soul.

Rowson: Yes, I think this is quite a handy distinction. This is not in the thesis, but helpful here. I spent three years studying philosophy at Oxford in seminar rooms and tutorials with people who are analytically quite fierce and who want to get away from a Cartesian notion of separation of mind and body, and also in my current role as Director of the Social Brain Center at the RSA – a place where intellect and policy are hegemonic and spirit and even emotions are somewhat subordinate.

In any case, there is a kind of professional assumption that consciousness is ultimately material and any notion of the soul is an old fashioned folklore construction we can do without. But actually in recent years I very much changed my mind on that. I think the notion of a soul is absolutely indispensable and it's very valuable and to be spoken of with some pride.

That doesn't, of course, mean there is a little essence that's sort of shiny and pink on the inside close to your heart. It's not soul as product or entity, but soul as the fullest possible context of human experience. Soul gets at what it is to be *an experiencer as such* in the fullest possible context of time and space and life and death and love and loss and so forth.

It's actually something that goes beyond self. You could say that self is about commentary on experience, but soul is closer to experience as such. I know that in Wilberian models and so forth that he goes from self to soul to spirit, but the models are not fresh enough in my mind to link to that. For now, I find that notion of soul captures something quite deep about the playful quality of being alive, the creative quality of being alive. On the other hand I have come to see the self as the identity, the personality and the commentary, which often manifest as barriers to a life fully lived.

Reams: I think that is a very helpful distinction. Of course, it resonates with a lot of stuff I've said and written over the years as well. It leads me to then link this notion of the self to the mind and even to David Bohm's notion that he talks about as thought as a system, where the system of thought constructs an identity, and it's a mental construct, but then it identifies with that. So in that context one of the notes I made here is it seems you're talking about the mind as a servant not a master. And that you try to point to the pathway towards generating wisdom or being able to fall prey to spontaneous wise acts as a need to cultivate certain habits so the mind is more open and amenable to those insights and impulses from soul and not constrained to stay on the edge of the dance floor because the self image doesn't align with being open to that experience.

Rowson: Yes, that's well put and it's more or less how I would put it too. I view self as something virtual but therefore functionally real even if it is not ontologically real. The self is something interesting, even compelling, but also problematic; something I think we need to work towards understanding, integrating and ultimately transcending.

Whereas the soul on the other hand is something I see to be more deeply embraced as part of being fully human. I think there is something about shaking off the self or recognizing that it's a kind of constraint, but we also need it to get through life, so there is something to be said for being at peace with it too – in fact the two things – deeply accepting and fully transcending, may even amount to the same thing in practice.

The soul, on the other hand, is something to be reconnected with and re-experienced because I don't think of the soul as something that reinforces an identity, reinforces a construct of who we are. I think the soul is much more about being fully present for whatever is going on, and that includes other people. Indeed, in this sense moments calling for wise action are not 'set pieces' calling for a formula, but more like a sudden switch from self to soul, in which we free up levels of awareness that allow us to act more judiciously than we could through mere self-expression or self-concern.

Looking back on my thesis, I see more clearly now than I did then that empirically it's very hard to go anywhere with this idea of wise action. You can't really simulate it. You can create scenarios with several people where you're asked to enact a certain difficult complex situation and see what emerges, but that's quite labor intensive and would require a lot of heavy lifting. I say this now because I don't want people to think that wise action is somehow one of these cliff hangers in a Hollywood movie where you say just the right words or do just the right thing to resolve the dramatic tension.

I see it more like an extra-ordinary daily capacity. Sometimes you get home from the office and your head is full of work and you can't really connect with your wife because despite your best abilities your mind is lost in your last email. I think there the challenge of wisdom is somehow to be able to come out of it and be present for the person who needs you. That isn't easy. That is partly a practice related issue in the sense that your mind needs the prior experience of dis-embedding from what it's embedded in. I don't think there's any real short cut to that. There are times when we really can't shake off our immediate experience and connect. But I think various forms of spiritual practice may offer a way out of that.

Reams: Right. So as I'm listening to you describe this I have this image for the average person there is maybe a phenomenological fuzziness and fusion because they'll have a lived experience as soul you could say, and they will have all these kinds of self-images and mental constructs about that experience all kind of mushed together.

Rowson: Yes.

Reams: Earlier I asked you about the process of doing the thesis. Part of that process was that you had this array of stories that you interviewed people around and through that *process I saw people making distinctions about what seems wise and what isn't and why and what perspectives are there on that. The process of being able to differentiate and make distinctions seems to have given you a better sense of this distinction between self and soul which could lead to understanding how do you cultivate practices to enable the self to be more open to soul.*

Rowson: Yes, that's in effect how I see it. I think it's also useful to use language that creates some friction against dominant paradigms. So self is an uncontroversial term and it's heavily saturated with perspectives from a whole range of disciplines. But soul is one of these terms that has a different power or different atmosphere around it in terms of the way we talk about it.

Because your hardened scientist materialists wants to say the soul, well we did away with that and we're now working on the mind, and really there is the brain left and even the brain breaks down into neurons and genes, and so forth. So there is this heavy reduction and the soul is right at the beginning of that.

But you also have people like Iain McGilchrist and Nicolas Humphrey and various other scientists who are saying look: even William James if you look at his early writings, speaks about the soul being something we have to do away with. But if you read how he talks of it, it's like very much a "thou doth protest too much" moment. You can really sense that he doesn't want to do away with it (the soul) but feels he has to.

So these people are saying look, it's a very useful concept and if we lose it we lose this perspective of the whole that is how we live at least some of our lives. Some of our richer and deeper moments have this sense of fullness that we can't just disavow. We can't just say those are not 'real'. We need language for those moments that goes beyond emotion and beyond mind and beyond aesthetics and so forth. And the language of the soul, I think, helps to do that.

So it's a brave and somewhat contrarian act that amounts to saying look: I insist on using these terms that are slightly awkward.

Reams: Yes, I've encountered the same because I've used the term soul in publications, and for me the logical distinction is to say all the self characteristics have this transient virtuality to them. So as a ground of being I would prefer soul, which has this sense of eternalness and I'd much rather ground my being in that than in an ephemeral self.

In relation to academic discourse for example I like to reference Mario Beauregard's work, because he's doing neuroscience and talking about how you can interpret if from a non-materialistic view.

Then there is something you talk about in your thesis, that even talking about wisdom is intellectually subversive.

Rowson: Yes, yes, very much so. That said, I sense there are these pockets of resistance in the intellectual world, broadly conceived. At one level there are those who will pay lip service to it but won't really quite know what to do with it. So we've got people like George Lakoff and Mark Johnson writing about the embodied mind and they are asking rhetorically: what is the spirituality of the embodied mind? What is it?

Or people like Jonathan Haidt, maybe, who's saying religious perspectives, particularly as they are manifest in certain implicit ideas of value and the sacred, are experienced as profoundly real, even if the attendant beliefs may not be. But rather than probe these tensions further, they are often presented as afterthoughts. And so in effect you have impressive people saying: I think someone else should look at this in a bit more detail, but if I look at it too much I might undermine my own reputation for scientific impartiality.

Some of course look at it more head on and they have a difficult challenge because there isn't this dominant notion of what intellectual common sense is supposed to be. One of the people I think is best at 'fighting back' is Rupert Sheldrake'; I don't know if you've come across his work?

Reams: I had dinner with him at a conference 16 years ago.

Rowson: Okay. He's quite an important voice I think. Someone described him as a fly buzzing around the heads of the dogmatic materialists. He won't go away because he insists on asking the questions in a scientific fashion. Can you explain this with your available data? Where exactly is memory in the brain? How does it make sense?

Reams: Yes, DNA can explain all these things.

Rowson: What exactly is matter? What is your theory of matter? Where exactly is your materialistic consciousness. He's probing people all the time and he's not the only one of course.

Reams: Amit Goswami is another one.

Rowson: Say again please?

Reams: Amit Goswami, the physicist. He's another one who has done that, he's even done the math around it.

Since this is in the area of what you're talking about now, one of my favorite type of questions is; how might you characterize your cosmological framework?

Rowson: Right.

Reams: Because I think that's the lens that's implicit in how you're looking at all this, that enables you to make these distinctions, engage in these practices and processes. So there is something that is enabling all of this.

Rowson: I can speak to that from personal experience now because as I mentioned before the interview started, I just submitted a report that roughly took me two years to complete and involves about 300 or so people and it's about spirituality in the public realm.

One of the things I cited early on, and I think this was a difficult but correct move, was not to make it about fundamental beliefs about how the world is, so I'll come back to what that means for cosmological framework. But what I decided was look; you have broadly three relationships with spirituality. You have the conventional religious spirituality which, of course, includes many different traditions and within those traditions are lots of disagreements and so forth, but they all share a certain perspective of what the world is and what follows from that for our action.

Of course, as I said, there will be big disagreements but they share this idea of there is a metaphysical picture and then an ethical set of ideas that come out of that. Then you have something that's called spiritual but not religious, although I think that's an increasingly problematic term. There is a very broad group of people who don't particularly identify with any religion but don't want to disavow the spiritual, and by the spiritual they often do mean something non-material, whether a being or a certain kind of experience they can't account for. For example, they might think there is an immaterial soul even though they might not be able to hold that under cross examination.

Then finally you have atheistic sectors of spirituality, which is what people like Sam Harris and so forth are beginning to develop, stemming from the recognition that a liberal humanist world view lacks something. It lacks an aspect of experience that connects to us at the level of depth and transcendence and meaning and the sacred, none of which are really going to go away.

I decided that the only way to do justice to the idea of the spiritual was to carry all three of these perspectives and try to hold the tension. I decided that if spirituality was ever going to have a chance to be recognized as a valid subject of shared public concern, everybody had to have at least some stake in it. Now that makes it difficult because you have some people saying look, the spiritual is meaningless unless you have a view of something immaterial, a divine presence or purpose or providence that shapes the world. Others will say look, I don't really want to be on the same page as people who think we all ought to go back to church even if we don't believe in God, and so on.

So there is a lot of tension in that approach, but I decided that actually you can unpack a view of the spiritual that includes all these things and I tried to do that. I mention that now and the report will explain how I went about that, but what I want to share is the kinds of reactions I've had to that.

In a speech about the report I gave recently [which you can find here] I distinguished between three broad reactions and I based them on the facial expressions people give me when I start talking about the spiritual. So should I go on about this?

Reams: Yes.

Rowson: Good. The first reaction is from what I call the spiritual swingers. By that I mean people who look at you when you mention the spiritual, they look at you eagerly and excitedly, feeling that you're one of them and on their turf and we should speak more about this. But they don't typically distinguish between different kinds of spiritual engagement. So for them going to a three month Vipassana Retreat is a-piece with a quick visit to the Tarot reader or buying a new age self-help book. There isn't really any sense of discrimination about what the spiritual refers to. So I call them the spiritual swingers, and they are very keen for this discussion to take place. That's not to disparage them and it's not as though they couldn't discriminate, it's just at the moment in many cases they're not doing that.

The second group I call the religious diplomats. They look at your warmly and welcomingly but with a slight hint of distrust. Imagine people who are maybe on the liberal side of Christianity, or maybe secular Buddhists, and relatively secularized people in the Vedantic tradition who are still practicing in various ways. They will think you're onto something very important and yes it's actually a big part of public life but they'll distrust it because they don't really see how it works outside of a tradition or institutional context with particular doctrines or practices. So they are keen to see where you can get to, but don't seem to really believe in it at some level. I call them religious diplomats because they're encouraging but you also sense that they have an agenda of their own which is to preserve the integrity of their own traditions.

Finally you have what I call the intellectual assassins, and they're the hardest to face. They look at you with a kind of disgust and disdain. They look at you as if, what the hell are you talking about? This spirituality is nebulous nonsense and you know it. You went to Oxford for God's sake, why are you talking about the spiritual? These people are actually quite hard to deal with.

I realized after a while, of course, that these three constructs are projections and that I have them all in my psyche. They're all different ways in which I wrestle with what it is to speak of the spiritual. On the one hand I'm quite skeptical and so I'm not at ease with a spiritual free-for-all, an "anything goes" approach. On the other hand I can clearly see this is a big part of my life and I feel as though it needs to be a bigger part of the world's conversation, at least in advanced democracies, advanced capitalist or late capitalist or post capitalist societies.

So I see this very complex picture emerging where, within the sociology of religion they're realizing that the secularization narrative hasn't really happened. It's just not true that the triumph of reason and death of God has really happened. Instead you have this confused incipient world of different beliefs and different perspectives that hasn't yet taken real shape in any sort of crystallized form, and may never do.

One the one hand that's a bit dizzying and troubling and it makes sense that people would want to go back to religion in that context. On the other hand you have the sense that if only we could keep the conversation going we might find something that works or begins to make sense for those who feel they could never 'go back' to religion, no matter how much it reforms.

Reams: Lots of the things there and I'm just making some notes to hold some of them. One is how I hear some of what you're saying is that some people are struggling to come to what I would call a trans-rational rather than a pre-rational view of spirituality.

Rowson: Yes that's right.

Reams: Some of the swingers find it easy to be with the pre-rational because they don't want to get bogged down in having to do the heavy labor or make rigorous distinctions to clarify things. So anything is good as long as it isn't that rational view. The ones who are really within the rational view are like the diplomats. I would surmise them to be saying yes that's all nice, we know there's something more there, but it needs to be rooted in some kind of rational explanation.

Rowson: Yes.

Reams: And the assassins, well that's a whole other matter. But would there be…

Rowson: They are important because they are the high priests of the academy and also the high priests of much of policy making. I think the intellectual assassin mindset, which in effect says defend your terms and measure your measurables and then assess your impact. That's the kind of mentality a lot of these people have, at least in their professional role, and I call them assassins because they're quite skilled. It's not necessarily that they don't sense here's something going on. But whether because they're defensive or uncomfortable with the language that they think of as pre-rational, they're the biggest challenge in some ways.

Reams: Right, and the picture I have from what you're saying, which is they may have some phenomenological experience or practice or connection to something, but the mind is more of a master than a servant and so the intellectual need to put things in the frames that it can relate to drives it more.

Rowson: True.

Reams: So a couple of questions. One is; is there another category other than those three reactions that you would like to encounter?

Rowson: Yes. It's funny I didn't put this into the speech but I thought about it. I think the appropriate response is a mixture of all three of these. So you want the critical discrimination of the intellectual assassin, you want the deep historical and institutional understanding of the religious diplomats and you want the kind of radical openness to experience of the spiritual swingers.

The question is what do you get when those three, when they aren't just thrown in and sort of mixed together but somehow optimally connected so that the whole is greater than the sum of its parts. I don't know what the term would be for that kind of person but…

Reams: Well I think Kegan's notion of being able to…

Rowson: Something approaching wisdom might be it.

Reams: Yes. Having a self-transforming mind would enable you to take on the characteristics of those different perspectives, views and attitudes as appropriate but not identify with them.

Rowson: Yes exactly. I think maybe the point is just that. It's funny with Kegan and Wilber, for me it's like they're not second nature to me to that extent. I'm often reminded of them and see – of that perspective again - and oh yes, that's how it fits.

In this case, I wasn't thinking developmentally, but perhaps the spiritual swinger might be more Kegan's stage two or three but the other two are probably a bit more stage four in my view of them. But yes you're right, probably what you need is something more stage five like or beyond that in that sense is worth working towards.

Reams: Right. I think the distinction I would pull us back to is that is something you're looking for as a sense of character or way of being that has enough of a type of soul presence to manage the self and the embodied reactiveness that you pointed to as some of the issues that keep us from making this progress on the path towards wisdom.

Rowson: Yes, and for me the picture is always complicated by certain things. If I have weaknesses as a thinker - and I certainly do! - one of the main ones is knowing what is out and what is in scope. I tend not to draw boundaries very well. I'm interested to think about the social and political context of any given personal pathway.

We live in a time of a fairly unstable economy and technological proliferation, potential ecological collapse, all are arguably already underway. You have all these things in the back of your mind, and then for me it doesn't make sense to speak of personal cultivation without some awareness of those situational factors that provide the context for it. That's difficult because it's already complicated and it gets even more complicated when you bring that in.

Reams: Right, which gets us back to the question around cosmological framework.

Rowson: Yes. My own cosmological framework would be, well my biggest formative experience as a person is playing chess professionally for many years. I became a Grandmaster and was the British Chess Champion and it was a huge part of my life. I wrote three books about the game. I wondered recently what exactly transferred from that main specific expertise.

I didn't put this in the spirituality report but I did write it at one point and I realized there are three main things. One of main ones relates to the fact that in chess we often use this expression, "keep the tension". There are moments where you can clarify the situation, for instance you might make a pawn exchange or a piece exchange or take some tension out of the position, something that's unresolved and you resolve it.

Actually, a lot of chess skills is marked by the capacity (a) not to do that and (b) to handle the tension well, because the argument is that the more complex your grasp of the position, the stronger you are, the more the tension will work in your favor because you'll be able to read all the different ways in which the tension might resolve itself and there are more potential pitfalls for your opponent, whereas you can manage them better. So the idea of keeping the tension is quite important to me.

In terms of my cosmological framework, chess also gave me the very strong inclination to inquire into what the other side is thinking. That's the reason I bring in the intellectual assassin. Some of my friends who are more into spirituality say: "You're always complicating it. Why are you always trying to convince people? Just do your own thing and enjoy it."

For me it's very important to sort of lock horns if you like with the important perspective and see what comes out of that. So my cosmological framework includes quite a big sense of pluralism and dealing with the other side and dealing with the shadow and so forth.

Finally, there is a third main thing I got from chess which was a suspicion of grand strategy. I know from chess deep down that anything that suggests if you do A and then B and C, D, E, then F will follow tends to come unstuck around B or C on a good day. So those three things together would mean any framework has to have a huge amount of scope for how we deal with the unresolved and holding spaces for conflict, a sort of deep respect for opposing views, a deep understanding that there will never be an overarching picture that will tell everyone what to do. There has to be room for conflict and chaos.

So my framework would have to have plenty of space for the tension being held and opponents being respected and a kind of view of progress that was sufficiently nuanced and tentative that you could actually believe in it.

Reams: So all that, and there may be more, but I want to stop for a minute. Some of the notes I made when looking at your thesis included a number of things about the virtuality of the self and the path to wisdom. I got this feeling for a sense of detachment or non-attachment at the heart of enabling all these things. And even as you describe this *process, and you describe it a little bit in your thesis, of what was interesting for you in playing chess, it was observing how your mind would relate to the very things you were just talking about now. That, to me, requires a certain kind of non-attachment to the mind and its processes to be able to witness it.*

Rowson: Yes. I think I've had that from a relatively young age – probably mostly because of chess, but perhaps also from being a type-one diabetic since I was six; you are just obliged to be a bit more experientially self-conscious. But at the same time I don't think that is it in and of itself a good thing! You can use that for good or ill.

What I'm reminded of by the mention of the detachment is the Zen teaching story about the different stages of the ox. I don't know if you know the one I mean but broadly the first one is about discovering the ox, the second is seeing it and you begin to wrestle with it and you're thrown off it and get back on it and so forth. As I remember the story it resolves itself by the man and ox being separate and then the man is alone and then the penultimate stage of this spiritual journey involves wrestling with the ox which, of course, represents the ego and that tells the story of seeing it in one's experience, beginning to wrestle with it, beginning to see how powerful it is and slowly getting some control over it.

The final one is called 'Entering the Marketplace with Open Arms'. That is about coming back into the fold. So on the one hand yes you detach, have to go through this struggle, this wrestling match with your inner forces and see them and in some sense and overpower them and in some sense make peace with them. But having done that it's not as though that's the battle. That's only the preview to the battle. The real difficult work is when you reengage with other people and you come to try and help others in their own way and that's a long journey, that's not something that a meditative vision does for you.

Reams: No, and I want to make a distinction because I recognize that the way you're using the term here or unpacking it is something I encounter a lot and so I want to come back to that. Also what you're describing also is Joseph Campbell's notion of the heroes' journey, you have to go out and slay the dragon but then you have to come back, and how do you bring what you've gained from that experience back to the community?

Rowson: Yes, that's part of it and we're in this magical space, and we talked about this but since we're on this, I'm reminded of Frodo in Lord of the Rings actually. What I find as one of the truest, beautiful parts of that story in that book and film is the idea that Frodo couldn't really stay in the Shire. The idea that he'd been through too much, he'd too been bruised and changed by it fundamentally, he couldn't carry on being a Hobbit in the Shire.

I think there is something in that too. If you have any Scottish readers there is a famous slightly nationalistic song called Caledonia and there is a line in there: "Lost the friends I needed losing; found others on the way." I think there is something to that as well. There is a lot of loss on a spiritual journey it's not all just about gain. It's about pain and the severing of some cherished attachments.

Reams: Yes very much. So in that sense the severing of attachments or I think often of identifications that we in a way become disillusioned, in that we lose some of our illusions about our self and others. At the same time, and that's why I say detachment or non-attachment, for me there is an implicit connotation that detachment is in no way disengaging from the world. It is about being fully present in the world and yet at the same time not had by it, not lost in it.

Rowson: Yes, that's helpful. I think you're right. It's one of the terms that has certain implicit meanings that aren't altogether helpful. To detach in a way is to reengage rather than be lost.

Reams: I think this comes back to your distinction between self and soul. Where is the point of detachment? What is it we are detaching from? It may be that it's from this virtuality of self if we're not identifying with it as the ground of our being, it allows us a freedom.

There was a line in your thesis from Watzlawick that you cite, that I noted very strongly that he talked about taking total responsibility for creating our own world, but that at the same time this gave us total freedom.

Rowson: Yes, which is slightly terrifying. I have probably moved away from that now. I think my thinking in the last few years, of having been married and having a child, I have a much stronger felt sense of interdependence than I think I had at the time I wrote the thesis. You know, just being a functional 21st century grown up – staying sane, not to mention flourishing, is pretty exacting.

So the idea that we can ever have that degree of control over our own reality I think, well, it's not entirely untrue but you have to really find your inner power. One of the best books I've read in the last few years if I'm fully honest is a book about archetypes of the mature masculine psyche. It's a Jungian book, but I found it very helpful, called *King, Warrior, Magician, Lover*. It's about how these different types of undercurrents of our life need to be brought to fruition to function properly as a man.

There are, of course, female and feminine parallels all along I'm pretty sure, but it made sense to me because at some point when I was struggling I realized that I had more or less outsourced all these archetypes to other people and I had to reassimilate them in my own way.

So things like just taking ownership of difficult domestic decisions that you might prefer to defer or outsource, that would be King-like energy, or even getting the bills paid, making sure you fix the things that get broken in the home, and perhaps most importantly demarcating what is really in your 'kingdom' and what isn't i.e. What matters and what doesn't.

Then warrior energy is, broadly, what are you fighting for? What really matters and what doesn't? Lover energy is getting in touch with the soul like qualities of sensuality and playfulness. And there is a magician energy that is full of insight and knowledge and specialist understanding. That's always been my delight, but also my problem. To live a balanced life you shouldn't let the magician energy run riot. It's about having a mature conception of it.

I mention all that now because I think once you bring in other people – colleagues, friends, children, parents, spouses- into the equation, it's extremely exacting to actually 'create your own world'. You have to discover whatever personal power of control or perspective that you can, and that requires maturation, quite rapid maturation sometimes, but it's a maturation that can only come about through adapting to the worlds of other people; it really can't come about in isolation.

Reams: Yes. There is something about this that for me always bumps into some of the connotations or implications of cosmological framework, because people say it's all well and good to be the person responsible for creating your world until you end up in certain circumstances where as you say you're suddenly in this much more interdependent dynamic and you see why you're not in control of these things, but how are you going to be responsible for them and have the freedom that comes from that.

In this case, I like to reference for instance, James Hillman in the Soul's Code about going back to Plato and the Myth of Er and the notion that we don't come into this world as blank slates. That genetic nature and nurturing of our environment together cannot explain all of our character and being in the world. There is something prior to that that comes in and in that sense can bring in with it some sense of fate or destiny that gives us circumstances that we wonder, where did we create this from? And yet in a deeper more profound sense we have created it before we came here.

Rowson: Right. Well this is an interesting one and when I come back to keeping the tension on the spiritual, this is a good case in point because part of me very much wants to go with you on that and say yes that's true to experience and coheres with a lot of things I believe and do. Another part of me here is the rational skeptic saying, yes certainly there is not a blank slate, there is an evolutionary endowment including a certain epigenetic process whereby culture and genes and so forth give rise to certain preconditions.

I forget who it was but I think it was Jonathan Haidt who said that "innate does not mean fixed and determined. It means organized prior to experience."

Reams: Okay.

Rowson: I think that's quite a useful expression. Innate means organized prior to experience. In other words, there is a default setting that isn't trivial and is quite important. The default setting shapes what follows in important ways. The question is, does that default setting include archetypes in the Jungian sense? Does it include some in built sense of the hero's quest in Campbell's sense? I don't really know the answer to that but I think it *could* but I am far from certain that it does.

Reams: Right. So as I listen to that response I also would want to refer back to this distinction between self and soul and is it possible that some of these things you're describing are relating more to the concept of self and less to the presence of soul as a kind of ongoing learning entity?

Rowson: Well it's possible. I mean, I wonder. Part of me wants to find the courage to say yes I believe we have something very much resembling a soul. It may not be ontologically material in the same way the body and skeleton are but it's nonetheless real and when we're born there is something like an individual soul, and it is somehow part of a greater world soul; a part of me really thinks that and really wants to go with that.
But I can't go all the way there. There's another part of me that is pulling back and pressing the brakes and saying: Look, the soul may be an emergent property and come about through the experience of being in the world, and observing other people and going through certain experiences. It may not be there as such when you're born. On the other hand I don't know what that would mean, or how it could be exactly.

That book that I mentioned about the archetypes, there is something deeply real about that. When I came across this it wasn't just intellectually satisfying, it was emotionally validating and made me feel yes, this is true. At some level, fundamentally to function fully and feel well and feel functional in society, I need to get back in touch with these aspects of my psyche that I've forsaken.

Reams: Right.

Rowson: These aspects of my psyche, they are at the soul level, you're right, they're not really self related, they are more about the journey and quest and the archetypes. I guess I would say I'm with you on that, but a part of me is reluctant to close the door on that and wants to keep some air for the skeptic to breathe.

Reams: But what I hear in that is you applying what you described as your learning about how to be in chess, to hold the tension. That there is clearly a tension there for you and that becomes a living question. So you don't want to bring closure on it because that takes away the openness to learning and growth and letting that tension as you quote Kegan and Lahey, "let the problem solve you rather than you solve it."

Rowson: Yes, I had forgotten that expression. I remember enjoying that. So yes, the challenge is, and this is keeping it real again, that disposition makes you quite difficult to live with! It might be intellectually interesting and it might even be true to how we should think at some level about certain things. But people you're managing at work, or family at home often want a resolute decision, and quickly. And saying let's keep it open and let's not resolve the tension is by no means always welcome. People in your life want to know the big fundamental existential decisions and you're like, well, why didn't the problem solve me? I'm not sure that kind of perspective is always helpful.

Yes, I guess I'm doing it again. I'm keeping the tension again, but that does seem to be quite a big factor in how I approach things. I hope that if we speak again in five years I may have somehow developed a somewhat less problematic relationship to this issue. At the moment it doesn’t particularly feel like a strength; it feels more like a feature that permits certain things, but with certain problems.

Reams: I made a note before this interview about where you talk about the significance of Varela’s claim of the need to have first person experience of the virtuality of self.

Rowson: Yes.

Reams: The tension that I hear you describing in your thesis and talk about now is that when there is not a conscious awareness of that kind of experience in a clear way, then the perceptual means that you have to encounter that question generates a lot of this tension. It’s like a Zen koan and its generating tremendous tension. I could say for myself, from my own experience, having had a really profound experience of that virtuality of the self, I see how it has worked on me for 23 years now, that it has enabled me to relate to that dichotomy in a way with much less tension.

Rowson: Yes, okay, good to hear that. I guess I have a sense within myself that there is a great deal of development still to go. In some of my better moments in the last few weeks and months I have been performing simple human acts well. So being on time, feeding my son well and mindfully, making sure I was available for my wife, speaking well to colleagues and making sure I’m listening. Simple, important things.

Such things actually require presence and require me to get out of my typical mindset. Those achievements have been quite satisfying because I sense that feeling of self-control and inner growth and just the simple act of being present and how difficult it is in daily life is quite a significant. When you get it, you think if I can be like this more of the time then I can’t really ask for more. Just to enjoy those simple moments of living more fully and deeply because you’re present to them.

Reams: Right. This goes back to something you were writing about in your thesis, that one of the challenges of, for instance, defining wisdom is that most of the definitions do not have a good path towards becoming wiser built into them. In that sense it’s actually unwise to try and define wisdom. What I hear you describing now is a sense of an actual lived path towards becoming wiser.

Rowson: Yes, I think you put it quite well there. There is a wonderful essay by, I think, Chandler & Holiday in one of the Sternberg wisdom collections where they write about whatever wisdom is, it shouldn’t be ‘a charred fragment from our psychometric past’. They were recognizing that the wish to measure and define might be antithetical to the qualities we’re trying to bring to bear.

By contrast, I think within religious traditions they actually have pathways towards wisdom, but it’s just that many aspects of our culture have become a bit wary of conventional religion and we often don’t see them as such. For example, the Buddhist eightfold path is the quintessence of a pathway towards becoming wiser. But why don’t we see that? Well for some it doesn't feel like their thing. Some are put off by the fact that it's explicitly religious or there is too much of a commitment to one pathway. But they have presented both a story of how things are and a story of how we have to be to live better and more fully. There are similar things in other religions as well.

Reams: But I'm reminded of a moment where one of my colleagues at Integral Review, Bonnie Roy and I were at the Metanexus Conference back in 2007 and there was a panel that Marty Seligman was chairing. They had top scholars from the Jewish tradition, the Christian tradition and the Islamic tradition and they were all going on at length about all these things. Bonnie got up there and asked, so what does your theology have to say about cultivating love?

Rowson: Right.

Reams: And they all sat there and said nothing. They really didn't have a response to that.

Rowson: That's sad to hear. In the report that is about to come out we speak about four main reference points for our discussion of spirituality that keeps these three perspectives on board, that appeases the intellectual assassins and placates the religious diplomats and also helps the spiritual swingers to find something.

Love is the first of those, death is the second and then self and soul are the third and fourth. I feel these four things have to be at the center of the conversation because they seem to me to be the most fundamental. On love, I think, any sort of spiritual perspective that doesn't have a story to tell about love is fundamentally lacking. And to be fair, Christianity has love right at heart of things, which gives me a weird kind of cultural pride.

Reams: I think the challenge was this was a group of theologians.

Rowson: Right. So the thing is there is an experience of love that many of us know, most of us I guess, which involves a kind of welling up on the inside, but it's unlike anything else; and it is so clearly true and real at some fundamental level and is a sign of what we care about and should be living for, but it comes and goes so infrequently that we don't always recognize it as being the sign of how we should live.

I think speaking the language of love and recognizing that we're going to die, realizing that the self is somewhat problematic and something to be worked through and to some degree overcome and then reconnecting with the soul. For me this is the sort of broad tapestry of what the new spirituality might look like.

Reams: That brings me to a question, as we have started out talking about wisdom and wisdom related knowledge to wise acts and all this, it's clear that somehow in the mix of this is a lot of spirituality.

Rowson: I think so. When I wrote the thesis I recognized that, but didn't make too much of it. Now I would probably push that a bit harder. I think like soul, spirituality is a phenomenon, also a term we should be a bit more fortified by using. I think there are lots of people who never come across the term or don't think of themselves as spiritual who might nonetheless be wise. But I don't think that matters too much. I think they are pointing to similar things. They're pointing away from our place and by that I mean a kind of status and our personality and identity and back towards our ground; and by that I mean our fragility, our pending death, our relationships that matter deeply to us, our experiences of love in our life.

So this distinction between ground and place, I think for people who are wiser they have a much stronger sense of the ground and a much better perspective on their place. They are less caught up on what it is to get on in the world and more fully attuned to what it means to be in the world.

So for me the two are quite closely linked. There are certain distinctions of course, and you can get wise managers and the term wisdom is a little bit promiscuous like that - it goes everywhere. Spirituality is a little bit more specific probably.

Reams: Yes. Where that question would lead into is, is there any sense of where this is heading? I know you have the RSA project and I remember being at one of the events, and you have the report coming out now. Is there a sense of where you might want to go with this work in the future?

Rowson: We'll see when and how and in what institutional capacity, but there are a few things going on. In addition to the spirituality work I spent a year in 2013 thinking about climate change from not a particularly spiritual perspective. I was looking at economic models and scientific projections and various social movements and so forth. And in my other work I sometimes think about inequality and educational reform and various other practical policy things.

For me the question at the moment is, how do you get better at bringing these things together? I am becoming a much comfortable using this kind of language more freely and confidently because I think there is a large but mostly latent appetite for it. We shouldn't shy away from words that matter to us and that point towards things that are important. For me it's not hiding away and retreating from my own personal development, it's very much about helping others to articulate what they already feel about these things.

Because whenever I've spoken about for example, the spiritual roots of climate change, people are quite attentive. My experience is that they 'get it' and at some intuitive level they know that the major problems we face are at some fundamental level 'spiritual'.

So the challenge is to enrich our conceptions spiritually enough so that it has a sort of tractable and comprehensible quality. But also to realize that it's not enough to map it out. One has to live it to some extent too. The challenge for me is to do that while simultaneously making sense of big complex political issues. So really it's how do you link the spiritual and the political in a way that doesn't drive you insane.

Reams: And if you can navigate that, you'll definitely be on the path of wisdom.

Rowson: I only can hope, but it remains to be seen!

Reams: Thanks very much for your time today Jonathan.

Rowson: Pleasure, thanks a lot.

The Cultivation of Wisdom in the Classroom

Juliane Reams[1]

Abstract: This article focuses on a research project that was designed to inquire into the cultivation of wisdom in the classroom in the context of a newly implemented school subject called Glück (English: happiness). Glück was introduced in order to make a difference in traditional mainstream schooling as a reaction to school curricula that emphasize data and knowledge transfer. It is different and new because it embraces the kind of learning that includes the senses, the mind, body, spirit and the guts. Its multidimensional approach makes an attempt to validate a renunciation of the reductionistic perspective of traditional and contemporary schooling. How it is implemented served as a transformational process through a set of experiential exercises, group discussions, contemplative practices, teamwork etc. It is my aim to give an insight into what I understood as an alternative learning arena embedded in a traditional schooling system and the implications for further development beyond the transfer of data and information in adolescents. Zooming in on Glück, I aim to provide some perspectives on how key experiences and the reflection upon them can lead to the cultivation of wisdom.

The understanding of cultivating wisdom I have gained from this study is that it is a dynamic process where the creation of new structures of meaning making emerge through the interaction with others, with oneself and the reflection upon one's own interior processes that can help unfold, know how to use and refine tacit knowledge. Part of this process is actively discovering and transforming complex information in order to embody it and make it one's own.

Due to the assumption that traditional schooling mostly puts an emphasis on conveying informational knowledge (Hart, 2009; Sternberg, 2001) (to the more or less attentive) students and another assumption that wisdom is often seen in connection to age, this article makes an attempt to give an alternative perspective. In this article I propose a synergistic model of the interior process that enables the activation of tacit knowledge into explicit knowledge and the development of age-appropriate wisdom in stages in due consideration of the nature and life tasks of adolescence.

Keywords: Adolescence, Bildung, happiness, positive psychology, reflection, self-awareness, wisdom theory.

Introduction

My interest for this subject had a very personal origin. Something that struck me first when I did my master's degree in counseling was that one of my professors had a completely different

way of teaching. His teaching method stood out from other teachers who I remembered from school and university and also from the other teachers in the program I was in at the time. In his lectures, I found myself in an interactive arena where my opinion was actively requested and my critical thinking and questioning was welcomed. As well, deep reflection and disclosure of my somewhat not so cultivated interior landscape was appreciated. Being stimulated to think for myself instead of being told what to think was not a familiar approach to me.

Another reason for my interest in linking my research subject to this school subject was that wisdom is a concept that adolescents often appear to be underestimated in. Conversations with people not involved in my research showed that the implicit understanding and opinions about (the development of) wisdom was wide-spread and often seen in connection to age. The older, the wiser, but not in connection to people of a young age so much. There is current wisdom literature that tries to refute this assumption (Sternberg, 2001; Pasupathi, Staudinger & Baltes, 2001). Many contemporary wisdom researchers also claim that wisdom does not automatically increase with age (Ardelt, 2010; Baltes & Freund, 2003; Jordan, 2005; Staudinger, 1999; Sternberg, 1990b).

The most important personal reason to engage in this research subject was the fact that I had been suffering from the education system for at least nine of my thirteen years (in the 80s into the early 90s) of traditional schooling in high school. Classes appeared to me more like indoctrination and often not more than accumulating informational knowledge. I was also affected by the impression of a high discontentedness among young people in my home country (Germany) and learning about Glück made questions and interest come up in me.

As I explored the constructs behind Glück, I found that the curriculum emphasized key elements essential for young people to create a better life for themselves in very practical terms. The integration of culturally relevant themes and even basic living conditions; such as buying groceries and cooking a meal together, to the curriculum was supposed to create awareness about these as being a resource to happiness beyond material welfare (Kaminski, n.y.). It also provided a container for them to reflect, get to know themselves better and explore the circumstances that facilitate lifelong learning.

Observing the Glück classes also revealed that the focus on gaining life competences appeared to have overlaps with the constructs of wisdom. If happiness was the key to gain life competences, what might be part of that process? Informed by roots in Nicomachean ethics and the theoretical foundation in Positive Psychology (Seligman, 2011), Antonovsky’s concept of salutogenesis (Antonovsky, 1979, 1987), and Motivation Psychology (Heckhausen & Rheinberg, 1980; Heckhausen & Gollwitzer, 1987; Rheinberg, 2002; Heckhausen & Heckhausen, 2010; Storch & Krause, 2005), Glück’s intention to cultivate happiness in the students raised the question in me if wisdom is cultivated in parallel. If so, how does it reveal itself? Or was a potentially arising wisdom-related knowledge an unintended consequence or outcome of the curriculum? What characteristics of this sensitive life phase regulate or facilitate an age-appropriate development of wisdom-related acting?

Societal Needs of the 21^{st} Century

Several societal needs and expectations indicate the necessity for a paradigm change in educational settings and traditional school curricula which are limited to a maximization of information through indoctrination (Hart, 2009; Gerver, 2010). Complex challenges the younger generation has to face in the contemporary context of a modern and fast moving globalized world creates a need for adaptation through a complete transformation in the principles and processes of public education (Robinson, in Gerver, 2010). This seems to be a consequence of recent discussions about educational concepts embedded in larger societal expectations and issues that illustrate the gap between traditional schooling and what today's students' needs are in order to be prepared for a future in an ill-defined world. Gerver (2010) emphasizes the imperative for change in traditional schooling and corroborates this with the need to prepare the new generation for "a successful life as adult citizens … making positive contributions to the world around them, … and develop the skills and behaviors that will see them flourish in the middle of the twenty-first century and beyond" (p. 4). Creating a space for the momentum of change is a challenge for any traditional school agenda and will require an arena for multi-dimensional learning and teaching. Another important factor is the role of the teacher in times of a "need of a fundamental shift of mind … about the concept of educational change itself" (Fullan, 1993, p. 3).

Questioning the existing education paradigm and moving from a system that maintains mental models of what education implies to a system that invites innovative teaching, transformation and embraces the kind of intelligences that facilitate the students´ holistic self-cultivation is challenging. It challenges not only the process as such, but also the existing concept of Bildung.

Moving from the earlier emphasis on conveying data and informational knowledge transmission to actually challenging the students to; observe and reflect upon their feelings, thoughts and behaviors, contemplate on purpose and goals, and help them develop an intrinsic appetite to learn, will inevitably raise questions in any traditional education system. It will not only require an emergent understanding powerful enough to break the existing dominance of the paradigm in society, the invigoration of innovative teaching, and also the ignition/cultivation of another kind of intelligence and learning in the students. This process of cultivation has a generative character as it can help students expand their repertoire of skills and refine and deepen their existing skills helping them to navigate their life tasks better, understand and overcome self-limiting beliefs and embrace personal growth and development.

Bildung

How does Glück fit with the term "Bildung"? What I took from observing classes, the interviews and from Glück literature (Fritz-Schubert, 2011a, 2011b) and working on this article was that the curriculum`s set-up and orientation turned out to resonate with the concept of "Bildung". This term is traceable back to Plato, Meister Eckhart and was later connected to German Enlightenment, Idealism, neo- humanism, and the philosophy of education. Bildung was also defined as liberal education and "became connected to the liberation of the mind from traditional dogma so that one can think for oneself to form oneself. In that sense, Bildung is

Selbst-Bildung (Selbst = the self, the I), which involves imprinting a picture of oneself on oneself" (Cuypers & Martin, 2013).

A broad range of thinkers such as; Humboldt, Hegel, Kant, Nietzsche and many others have laid different foundations to describe the connotation of the concept of Bildung in the European context. "Bildung" is different from its English translation "education" in that it (Bildung) encompasses the deeper and more holistic aspect validating meaning, purpose, the individual´s flourishing and self-development. The term "education" seems to have a more formal nature and this is critical for Bildung. Nevertheless, the latter etymologically refers to the verb "bilden" and "Bildung" to what can be described as "a process of designing an image (Bild)" (Schneider, 2012). A specific content-based formal knowledge is helpful to meet societal demands and is a part of the concept of Bildung. However, *designing an image* implies a more profound and active process of appropriation and internalizing knowledge to make it more accessible. It encompasses a process of growing into something, building character and manifesting ones aspirations and goals. It is my hypothesis that the conceptual framework of Glück can lay a fertile ground for this process by offering a container for a) a dynamic and holistic process of personal maturation as opposed to a mere accumulation of factual knowledge, and b) gaining perspective on this process, self-fulfillment, self-realization and self-leadership in order to be a "well-functioning participant" of society with aspirations and goals and the ability to think creatively and critically.

The current understanding of Bildung appears to be context-bound.[2] The international discourse on Bildung requires an attempt to synthesize the comprehension of different strands and to understand them as distinct from each other as well. There are similarities and differences between the concept of Bildung in Germany, the English-speaking research and the more recent concept of "transformative learning" coming from the US and Canada (Nohl, 2006). The notion of learning added a new aspect to traditional theories of Bildung in recent years (Meyer-Drawe, 2008). In the European context Bildung encapsulates processes of meaning making having transformative implications for the learner´s personality and embraces childhood, youth and adulthood. "Transformative learning" theories were developed in the US and Canada/in the English-speaking context to explain learning focusing on adulthood.

Teaching for Happiness / Wisdom

When researching adolescents` development of wisdom it is essential to account for the sensitivity of the life phase they are in. Adolescence is turbulent in many ways. It is molded by the development of critical thinking, the ability to make rational decisions about what to do or what to believe (Slavin, 2006), reflectivity, a tendency to think about what is going on in oneself and do self-inquiry. The awareness for their own uniqueness and separateness from others increases (ibid.) which is a part of their individuation (Jung, 1933), another important life task in this stage.

There are differences in several domains between intellectual knowledge and wisdom-related knowledge (Assmann, 1994; Chandler & Holliday, 1990; Clayton & Birren, 1980; Csikszentmihalyi & Rathunde, 1990; Sternberg, 1990a; all in Ardelt, 2000). Ardelt (2000, 2008) points to differences between intellectual and wisdom-related knowledge in these six domains;[3] goals, approach, range, acquisition, the effects of the knowledge on the knower, and the relation to aging. The overall picture of these differences is that intellectual knowledge is quantitatively oriented. It refers to the accumulation of factual evidences that provide predictability and values a scientific ground work that invites a narrower and more reductionistic world view. The nature of intellectual knowledge is that it is prone to be outdated. As opposed to this, wisdom-related knowledge refers to (an openness to) experiential learning and the integration of the knowledge of the body, mind and spirit. Thus, it provides a more multi-dimensional depth to relating to and making meaning of life in a holistic way.

---

[2] http://implexus.org/profiles/blogs/international-conference-transformative-learning-meets-bildung-fr

My understanding of these differences is that (the acquisition of) wisdom-related knowledge overlaps with vertical development and is related to growing perspective taking and cognitive complexity in how we learn and think. In contrast; acquiring intellectual knowledge refers more to additive, or horizontal development. A synthesis of both intellectual knowledge and wisdom-related knowledge, requires a vertical step up in cognitive development to be able to take a perspective on both at the same time and then to integrate them. Knowing how to apply it demands that a person can act from within this new level of understanding. This may create a finer-meshed, awareness based approach to mastery and navigating different life tasks.

Making such a contrasting juxtaposition as in comparing intellectual knowledge and wisdom-related knowledge is like comparing a reductionistic, scientific approach and the holistic and integrated approach. The tension of opposites in this contrasting illustration of these two types of knowledge presents possibilities for developmental progression, from solely validating intellectual knowledge that values control, predictability and logical sequencing (Hart, 2009) towards integrating wisdom-related knowledge that values intuition, acceptance of uncertainty and ambiguity, and non-linear learning processes. Of course, the possibility that adults are in Kegan`s later stages of consciousness is more likely than for adolescents,[4] because the latter do not have a set of required reference points in their lives yet. Nevertheless, setting and nurturing the seeds for the ground work for the cultivation of wisdom in that particular life phase is critical.

Teaching for happiness is of course an ambitious endeavor. Teaching for wisdom alludes to an ignition of the students` developmental processes through a synthesis of their cognitive abilities and their wisdom-related knowledge (Sternberg, Jarvin & Grigorenko, 2011). The hypothesis is that a more creative and integral/multi-disciplinary approach to teaching as opposed to traditional methods can open spaces for the individual to fuel the own process of development. Positive Psychology research (Seligman et al., 2009) on the positive effects on academic achievement in well-being programs supports the focus on positive education. Thus, going successfully through the 2 year Glück curriculum could help boost academic attainments. It could also fuel the individual´s intentionality to improve other skills necessary to make meaning of the world, find the own voice, make wiser decisions etc. Both teaching for happiness and teaching for wisdom, are dynamic activities. Teaching for wisdom will want to make an attempt to encourage the individual to step out of a socially programmed consensus consciousness, think critically, question assumptions and develop a deeper understanding of the architecture of one's own reality. It will try to foster the individual`s ability to make wise judgments and navigate and operate upon certain life challenges.

---

[3] Ardelt´s article focuses on the differences between intellectual and wisdom-related knowledge in the later years of life. It showed that many of the points in her listing were applied to early life stages in her article from 2008.

[4] While Krafcik and Spano (this issue) did not find evidence of a strong link between wisdom and later stage ego development, others such as Rowson (2008) noted overlaps between language describing characteristics of wisdom and language describing later stage ego development.

One`s explicit knowledge that is gained through data transfer has to be *"beefed up"* with implicit knowledge in order to be able to make wise judgments (Sternberg, 2001). This happens when attending to our inner processes. Happiness and wisdom can, in that sense, not be *taught*. It is rather indirectly, though actively, acquired and constitutes the inner condition of the adolescent that the individual brings out into the world. Teaching for wisdom fuels a developmental process of transformative nature whose major purpose is to empower the students' self-cultivation, the refinement of tacit knowledge, bring forth the ability to think critically and thus enable a shift in consciousness/their mindset. The fundamental idea behind bringing the cultivation of wisdom into the classroom is that teaching is not about telling the students what to think, but rather how to think (ibid.). In Glück, this is supported by an appreciation of numerous ways or multidimensional types of learning with attention to each student`s subjectivity. Glück`s main goal/ ambition, the cultivation of happiness, seems in many ways to be concordantly aligned with the cultivation of wisdom.

Transformative Education

Theorists and researchers have laid out various perspectives on transformative learning theory bringing great complexity to the field. The vantage points in diverse philosophical assumptions and underpinnings (constructivist assumptions, humanist assumptions, and critical social theory assumptions) are the fertile ground for a transformative learning theory that might appear fragmented and with clear boundaries as it displays a set of dominant perspectives (Cranton & Taylor, 2012). Considering the breadth of orientations and zooming in on them, Cranton and Taylor (2012) describe transformative learning theory as "cognitive and rational, as imaginative and intuitive, as spiritual, as related to individuation, as relational, and as relating to social change" (p. 7) and highlight the need for a more unified theory.

Most work on transformative learning theory is done in the field of adult learning. Theories of Bildung are used in adult learning as well, but the concept of Bildung also encompasses childhood and adolescence. Adolescence is a formative period with a broad range of developmental changes wherefore the call for a certain type of education seems evident for this life phase. While we need to be cognizant of the developmental differences between adolescence and adulthood, we also need to make an attempt to adjust our assumptions and consider adolescence as a valuable period for the encounter with alternative teaching methods that can be transformative.

One example for transformative education is Paolo Freire´s concept of critical pedagogy that focuses on liberation and transformative optimism (Freire, 1974). He argued for the political nature of education as the place where individuals and society are constructed. His thought-provoking pedagogy endorses problem-posing as a key to critical dialogue and focuses on how the questioning of the system and knowledge is essential for the development of a critical consciousness. Freirian critical education emphasizes the importance of a democratic and transformative relationship between the learner and the teacher, the learner and learning, and the learner and society. It invites the learner to be critical, question the system they live in and actively create the future they envision (Shor, 1993).

We can also find alternative education with transformative character in the Montessori and Steiner education movement. Both have an emphasis on a holistic education based on the child´s needs encompassing the spiritual, mental, physical and psychological development.

Brief Description of Relevant Approaches to Wisdom

The roots of the concept of wisdom go back to the classical philosophies of Plato and Aristotle. The postmodern understanding of wisdom and current wisdom literature generated several definitions of wisdom, because the concept of wisdom as a human attribute has changed over time in parallel to the evolutions in the society (Birren & Svensson, 2005). This article will only depict some notions that seemed most relevant in relation to the Glück curriculum.

Wisdom is related to our social-societal functioning and “universal knowledge that guides our behavior in ways that optimize productivity and well-being on the level of individuals and on the level of society at large” (Kunzmann & Baltes, 2005, p.110).

Wisdom is in this article defined as a construct that arises from a process of refinement and cultivation of tacit knowledge (Sternberg, Jarvin, & Grigorenko, 2011). This definition is also informed by understanding wisdom as a construct that regulates the use of certain skills (e.g. abstraction, reflection, self-awareness), which are involved in making wise choices for acting in the world (Sternberg, 2003; Schwartz & Sharpe, 2010). Wisdom is characterized by features such as the ability of critical-reflective thinking, self-awareness and sagacity in actions, decision making and meaning construction (Hart, 2009; Mezirow, 1990; Sternberg & Jordan, 2005; Sternberg, 2003; Sternberg, Jarvin, & Grigorenko, 2011; Garrison, 1997).

There are many different theories and approaches to understand wisdom, and all of them cover aspects which are relevant for this article. However, in order to discuss the cultivation of wisdom in relation to educational settings and the model proposed in this article, the most relevant seems to me to be Sternberg`s Balance Theory (1998, 2003). It aims at a balancing of one´s own interests and finally the common good. Balance Theory also points out that wisdom requires knowledge, and acknowledges tacit knowledge as the foundational feature of wisdom (Sternberg, 2001; Kunzmann & Baltes, 2005).

It gives validation to explicit formal knowledge as in intellectual skills relevant to a given theory of intelligence. But it also emphasizes this kind of knowledge´s limitation as not being sufficient in order to engage the world in a wise manner. Wisdom is a multi-faceted intelligence and appears as knowledge balancing interests. In Balance Theory,

> wisdom is defined as the application of tacit knowledge as well as explicit knowledge as mediated by values toward the achievement of a common good through a balance among a) intrapersonal, b) interpersonal, and c) extra-personal interests, over the a) short and b) long

> terms, to achieve a balance among a) adaptation to existing environments, b) shaping of existing environments, and c) selection of new environments. (Sternberg, 2001, p. 231)

The balance in this theory implies the seeking for good outcomes for oneself as much as for others. In this process, it is also necessary to be able to make distinctions as the common good may be better for some than for others. Problem-solving that requires wisdom-related skills will then always need to integrate at least some elements of each of intrapersonal, interpersonal, and extra-personal interests (ibid.).

The initiation of developmental steps through an activation of tacit knowledge requires experiential learning. “Tacit knowledge is action orientated, it helps individuals to achieve goals they personally value, and it can be acquired only through learning of one’s own experiences, not “vicariously” through reading books or through other’s instructions” (Kunzmann & Baltes, 2005, p. 115). Balance Theory also highlights the ability for four types of thinking. These are;

- analytical thinking (which includes an ability for metacognition, critiquing, judging, evaluating, comparing and contrasting, and assessing),
- creative thinking (including creating, discovering, inventing, imagining, supposing and hypothesizing),
- creatively insightful thinking, and
- good practical thinking (including applying, using, utilizing and practicing) (Sternberg, 1997).

Nevertheless, mastering these types of thinking does not necessarily imply the ability for wise acting, but it opens the possibility of having more choices and a broader range of options to face tasks and life in general. However, wise acting does require the capacity to take certain matters as an object of reflection and seeks for a more sophisticated way to engage the world. Having more choices is an essential step towards wise acting but requires the ability to reflect on it from different angles to make good judgments about possible courses of action.

The Nature of Adolescence and Its Life Tasks

Piaget’s Theory of Cognitive Development (Piaget, 1954) and Erikson`s Theory of Psychosocial Development (Erikson, 1950, 1968) are to be considered seminal descriptions of human psychological nature in personal development (Coleman & Hendry, 2009). Both Piaget’s and Erikson’s theories proceed in stages and are characterized by certain life tasks the human being is supposed to master.

In Erikson’s stages of psychosocial development, life is viewed as a series of eight stages (Erikson, 1950, 1968) in which each of them has a particular task. Erikson framed these particular life tasks as developmental crises dependent on if they are mastered in a successful or unsuccessful manner. The stage the participants of my research study are in is the late part of the fifth stage characterized by identity versus role confusion. Part of this stage is that adolescents figure out who they are and who they can be (Sternberg and Williams, 2002). From an Eriksonian perspective, “wisdom (…) develops from the person’s coactions with the world and the transformation of the person’s actions as they are directed toward the adaptive resolution of a series of psychosocial conflicts" (Takahashi & Overton, 2005, p. 46). Erikson understands wisdom as a concept that entails a certain equanimity and "involved disinvolvement" (Erikson, 1982, p. 61) with life. His model of psychosocial development points to the synthetic/transformational feature of the experience of wisdom and is broadly defined as "reflective understanding", a sense of detachment or a high level of meta-awareness of the self and situational contexts" (Erikson, Erikson, & Kivnick, 1986, 2005, pg. 46-7).

Like Erikson`s Theory of Psychosocial Development, Piaget's Theory of Cognitive Development also proceeds in stages. According to his theory, my participants would mainly be in the formal operational stage in which adolescents have a greater ability for hypothetico-deductive and abstract thinking (Piaget, 1954; Coleman and Hendry, 2009). Thus, the ongoing development of abstract and reflective thought is a part of the formal operational stage in adolescence.

To sum this up, Davis-Seaver (2000) highlights three different notions of the ability to think critically from a developmental perspective. She points to three seminal theorists and claims that the ability to think critically depends upon physical/biological maturation (Piaget) or upon resolving psychosocial tasks at a maturational level successfully (Erikson). She also highlights Vygotsky, who sees the developmental aspect in the ability to speak and in the formation of concepts which begins in early childhood, but takes shape and matures as higher-order thinking in puberty. Adolescence is the life phase of identity confusion and insecurities that drive the young individual´s need to seek recognition from peers. Adolescence is also a phase of rapid growth molded by the development of critical thinking (Slavin, 2006; Paul & Elder, 2014), "the ability to make rational decisions about what to do or what to believe" (Slavin, 2006, p. 269). These abilities come along with the development of reflectivity, a tendency to think about what is going on in oneself and do self-inquiry. The awareness for their own uniqueness and separateness from others increases (ibid.) which is a part of their individuation (Jung, 1933), another important life task in this stage. Part of the process of individuation and the age-related ability to use formal operations is also to make distinctions which are connected to the capacity of taking a hypothetico-deductive approach to problem-solving (Coleman and Hendry, 2009). Another important capability that develops in adolescence is "to think about mental constructs as objects which can be manipulated and to come to terms with notions of probability and belief" (ibid., p. 36). This can be linked to adolescents starting to think operationally, and who are not anymore embedded in hers or his perceptions but can detach oneself from them, and take them as an object of reflection and attention (Kegan, 1982, 1994; Uhlendorff, 2010).

In relation to a successful accomplishment of adolescence's life tasks, the Glück curriculum puts emphasis on the procurement of life competencies (Fritz-Schubert, 2011a, 2011b) which demand the abilities described above and that adolescents are supposed to develop in this life phase. The curriculum itself aims to help the adolescents to make progress on the life tasks by offering a schedule for self-exploration stretched over two years.

Meaning-Construction

In order to assume adult roles or confront the expectations (noted above) from society, adolescents may arrive at the point where individuation is a developmental challenge (Jung, 1933; Cole & Hendry, 2009). Zooming in on Glück, this is in a broad understanding also part of the aspired outcomes of a successful accomplishment of the curriculum. Confronting this developmental challenge and relating to oneself and the world demands the ability for meaning construction, it creates learning and is embedded in the constructive-developmental framework. The constructivist perspective on learning is that the human is in a process of creating knowledge and actively discovers and transforms complex information in order to embody it and make it one's own (Slavin, 2006). Taking a neo-Piagetian perspective on development as a process in his constructive-developmental theory, Kegan perpetuates the theoretical view of Piaget and claims that the epistemological, "deep structure of any principle of mental organization is the subject-object relationship" (Kegan, 1994, p. 32). The kind of experiencing that the subject-object principle facilitates is what is related to consciousness (ibid.), self-awareness and self-reflective thinking which is highly addressed in the cultivation of wisdom.

Gaining self-awareness requires reflection and a development of awareness of what is going on inside oneself (Jordan, 2002). The process of developing self-awareness proceeds in three stages of which the last one, transforming, includes the individual's intentionality that opens for an abjuration from the embeddedness in the old frame of reference (ibid.).

> Transforming our epistemologies, liberating ourselves from that in which we were embedded, making what was subject into object so that we can "have it" rather than "be had" by it – this is the most powerful way I know to conceptualize the growth of the mind. (Kegan, 1994, p. 34)

These shifts can initiate transformation.

It is a developmental process that carries along progressive changes which represent a higher sense of what to do of one's life, relationships and choices (Kegan, 1994), which is a relevant matter in adolescence. Moving from an egocentric mind to a socialized mind in adolescence is a process that asks progressive changes, and which can trigger inquiry in the young person about how to engage the world. Being socialized includes meeting and facing expectations from society as for example to be a "good citizen" who is aware of certain rules in life (ibid.), gain mastery over certain skills and accomplishment of certain life tasks (Piaget, 1954; Erikson, 1950, 1968). These are also the aspired to goals of the Glück curriculum.

Wisdom – A Matter of Age?

The assumption that wisdom is considered as a peak performance or end state of human development seems to give a touch of exclusivity to the possibility of enhancing wisdom-related knowledge only in later stages of development. This notion can be challenged to some degree. Adolescents` age-appropriate natural intellectual developments of generalization, logical thought and abstract conceptualization makes a case for considering young peoples´ internal and external processes in these domains as also pertaining to wisdom. While adolescents might not have such a sophisticated view on life yet (Sternberg and Jordan, 2005) or not accumulated enough experience yet to be considered wise, the seeds for later wise acting can be viewed as being planted during this phase of life. Thus personal growth and development tends to crystallize during this phase of life in the individual`s progress toward higher levels of meaning making and performance (Baltes & Smith, 1990). This creates an opening for individuals of a young age to also participate in the discussion on wisdom. Regarding Erikson`s stages of psychosocial development, the sample of interviewees were in the fifth stage characterized by identity versus role confusion. This stage embraces that adolescents figure out who they are and who they can be (Sternberg and Williams, 2002), a life phase to make generalizations from key experiences and explore one`s own personality. From an Eriksonian perspective wisdom would occur later, in the last stage of his stage model (Erikson, 1950). However, the focus on the development of wisdom as a construct related to post-formal thought or age exclusively seems to be outdated. Current wisdom literature promotes adolescence and young adulthood as important life phases regarding the potential development of wisdom-related knowledge (Pasupathi, Staudinger, & Baltes, 2001; Richardson, & Pasupathi, 2005; Sternberg, 2001; Bassett, n.y.[5]). Normative and age-appropriate knowledge develops in steep growth curves between 15 and 25 (Pasupathi, Staudinger, & Baltes, 2001).

Zooming in on the nature of adolescence, individuation and the search for one’s own identity indicate that it is a sensitive period of orientation. The young person seeks for knowledge to contemplate on these life problems as a direct response to their age-appropriate identity confusion (Ardelt & Jacobs, 2009). It is a “period of privileged encoding of autobiographical and other types of experiences” (Richardson & Pasupathi, 2005, p. 149) and heightened memory for experiences associated with reminiscence to create the kind of narratives and nexuses necessary to develop wisdom-related motivation and knowledge. While the seeds for the development (may) get set in adolescence, translating wisdom-related knowledge into action will require self-regulatory capabilities which come through experience. However, the key building blocks that facilitate the development of wisdom-related motivation and knowledge emerge in adolescence and early adulthood (ibid.). Adolescents also have attained the ability for abstract thought (Piaget, 1952) and metacognitive skills necessary to develop a certain kind of thought that facilitate wise thinking.

It can thus be argued that wisdom can be developed in every life phase or at any age. Facing developmental tasks from birth throughout all the different life stages, wisdom-related knowledge will emerge and manifest itself. As a part of personal growth and self-cultivation, wisdom will emerge from exposure to experiences that show up differently in different life phases (Ardelt & Jacobs, 2009; Ardelt, 2008; Bluck & Glück, 2004).

Although there seems to be a common understanding among many wisdom researchers that most demonstrations of wisdom will reveal itself in peoples´ later life stages (Ardelt, 2008; Bassett, 2015), its actual development seems to follow a steeper learning curve during adolescence than in adulthood (Pasupathi, Staudinger, & Baltes, 2001). Wisdom can be found in younger people too, especially in the ones who had to deal with hardships in their life (Bluck & Glück, 2004; Ardelt, 2008). It seems that the accumulation of certain key experiences is the sticking point that generates the connections and fuels the growth of wisdom. From this, we can surmise that withdrawal from making key experiences and opening oneself to the learning that comes with them won´t make one wiser. In contrast, feeling more coherent with oneself and the social environment, being more at ease with challenging life situations and one´s uncertainty coming along with identity confusion and individuation and to engage in the world will provide a broader range of possibilities to accelerate this growth process.

Teaching for Wisdom in Adolescence

All these arguments seem to give a body of evidence to the importance of having opportunities for laying a foundation that helps to spot certain acupuncture points that create a finer-meshed and generative tissue for the cultivation of wisdom in the young person. Still, the cultivation of wisdom in adolescents demands certain circumstances facilitating their growth. Apart from these arguments, there is another reason that speaks for teaching happiness and wisdom in the classroom. The curriculum holds a frame for social learning through the interaction with peers which is significant in terms of personal growth in the proximal learning zone (Vygotsky in John-Steiner, Souberman, Cole, & Scribner, (Eds.) 1978; Slavin, 2006; Coleman & Hendry, 2009).

The holding environment of the safe container (Winnicott, 1965; Bowlby, 1988) in the class offers a space of trust where the individual is invited to experience encouragement, support, valuable feedback and creative energy in the peer group. This reciprocal relationship opens for self-inquiry, being present to one’s own personal growth and learning through the creation of individual and collective awareness in the container (McClure, 2005). The quality of the holding environment will be crucial for the initiation of certain developmental processes in the adolescent. An essential part of this is the way of teaching.

Sternberg´s WICS[6] model is based on his Balance Theory and argues that wisdom, intelligence and creativity are developing expertise. They are presuppositions for citizens and professionals of the future, and for anyone else who aspires to meaningful success in life (Sternberg, 2009).[7] Sternberg argues that teaching for wisdom requires three types of teaching;

- teaching analytically (to encourage students to analyze, critique, judge, compare and contrast),
- teaching creatively (to encourage students to create, invent, discover, imagine if…, suppose that…, predict) and
- teaching practically (to encourage the students to apply, use, put into practice, implement, employ, render practical what they know).

A synthesis of these three different skill sets can give the students a broader range of possibilities for action and behavior. My research focused on an example of how this kind of teaching can be applied. The next section provides some background on this curriculum and a description of the research methodology.

The Roots of the Glück Curriculum

Glück is basically focused on giving the students a possibility to explore and experience how they can create a better life for themselves by providing a space, activities, and exercises to make and reflect upon key experiences. From this they can identify and explore alternatives for acting and decision making in future situations. Refining their ability to make generalizations from the experiences is a critical part of their wisdom-related learning process.

---

[6] WICS stands for “wisdom, intelligence and creativity, synthesized”.

[7] http://www.clarku.edu/aboutclark/pdfs/sternberg_wics.pdf

The message and contents of Glück is something a person can learn (Fritz-Schubert, 2011a, 2011b; Seligman, 2011; Lyubomirsky, 2007) but gaining life competencies requires effort and motivation. The Glück curriculum therefore embraces the notion of positive education, a wide range of learning styles and has a very practice-based approach instead of overloading the students with theories. The development of wisdom-related knowledge can in these learning processes help regulate the applicability of the aspired life competencies. It is also therefore critical for the subjective experience of the curriculum.

Glück Classes, Facilitation and Exercises

It is a major goal of the Glück curriculum that the students experience their creative strength in connection to the meaningfulness of their actions, and to unfold their intrinsic pursuit to reach for goals and realize them in their daily actions. This way they sit in the driver´s seat of their own growth processes, formulate and realize their goals and generate an enhanced motivation to learn. The ongoing practice of self-unfoldment through positive key experiences also increases their self-trust which can give them reference points to make connections for future situations as well. Thereby, the emergence of existential anxieties can be avoided (Kaminski, n. y.). Glück wants to bring forth an improvement of the students´ social competence and academic learning achievement, increase of resilience, gain of more energy, having better health and joy in life (Fritz-Schubert (2011a, 2011b), even (or especially) at times when life is tough and certain skills are required in order to master life`s challenges. To experience flow and develop joy in acquiring certain skills and reach goals is an important part of this process. The safe container in the community of the class facilitates the conditions to practice turning inwardly, explore and learn individually and collectively how to show up in the world, and act in the world instead of being acted upon.

An elaborated set of concrete exercises (which the curriculum calls positive key experiences) are as part of the Glück classes. They aim at helping the students become aware of moments of flow, a feeling of trust, responsibility and sense for community. The students` processes are supported through facilitated group reflections in class and followed up through homework reflection papers which have to be handed in as semester assignments.

In order to give a little taste of the positive key experiences in the curriculum, I want to mention the “Free Fall” and the “Value Hierarchy” exercises. Especially the “Free Fall” was frequently mentioned in the interviews in relation to its positive impact. In the “Free Fall” several adolescents stand close together on the floor right behind a table. One adolescent stands on the table with the back turned towards the other ones on the floor. Taking a deep breath and when feeling ready the one on the table lets herself/himself fall and the others catch her/him. These kinds of key experiences are supposed to give them a feeling of trust and self-confidence as much as responsibility, authenticity and team spirit. It is supposed to give them a richer treasure trove of experiences that allows the individual to acknowledge options for generalization and eventually transferability of the gathered learning to future situations and considerations. Future-defining relevance was considered in the purpose of the exercises that ask for teamwork as well as the acknowledgement of aspects that link together altruism and mental health.

In the “Value Hierarchy” the adolescents get several building bricks which represent a certain value. The class is then asked to discuss the values which are most important to them and then about which role and position in the hierarchy these values appear most important to them. The goal is to come to a mutual consent of which values are in which position when physically building a pyramid with the cubes. The top position of the pyramid represents then the value with the highest relevance to them. The quality of the physical interaction in the exercises is as important as the quality of the students` presence, attention and communication in the group process. The students` narratives revealed that the experience of working physically together, negotiating and reaching for a common goal was helpful for their understanding of their uniqueness, togetherness and concern for the common good.

The Glück curriculum is stretched over two years. The main constructs I have been able to perceive from reviewing available literature on the Glück curriculum are based upon several aspects of everyday life such as; the benefits of social togetherness, the experience of happiness, pleasure in life, their own achievement, the body in motion and as a means for expression, mental and physical well-being, nutrition, practical necessities in everyday life (such as planning the daily agenda), cultural codes as a base for social life and the self, including their own social responsibility as a member of the society. Mental training, meditation techniques, relaxation exercises, sports, yoga and drama activities to cultivate their sense of intuition are integral parts of the curriculum (Kaminski, n. y.; Fritz-Schubert, 2011a, 2011b).

Theoretical Foundations of the Glück Curriculum

A historical event, Caesar`s crossing of the Rubicon river, creates some of the theoretical background and illustrates a model in Motivational Psychology that demands from the learner setting a specific goal and by going through phases, strive after it, make decisions and eventually reach the goal. The Rubikon model (Heckhausen & Gollwitzer, 1987; Heckhausen & Heckhausen, 2010; Storch & Krause, 2005) describes four phases of acting – pondering (abwägen), planning (planen), acting (handeln), and evaluating (bewerten).

In positive psychology, the theoretical anchor for Glück, Seligman (2011) appeals for imagining positive education and stresses the importance of well-being. Schooling could, “without compromising either, teach both the skills of well-being and the skills of achievement” (p. 78). Well-being taught in school would ignite a paradigm shift and create a space for students to help them increase their creative and holistic thinking and their life satisfaction in general, foster better learning (ibid.), discover inner strengths, learn from crises, show responsibility, be more self-sufficient, have joy in everyday life and promote an optimistic attitude towards oneself, society and life in general (Fritz-Schubert, 2011a, 2011b). Well-being and positive moods enhancing learning, stimulating more creative and holistic thinking and broader attention (ibid.), create positive implications for the development of skills of achievement, increase life satisfaction and help prevent depression. This interconnection between the skills of well-being (for the most connected to happiness) and the skills of achievement (or academic performance) and increase of life satisfaction raises questions about the conditions. Which conditions facilitate this, and how can it be achieved?

One approach to answering this question can be found in research on coherence in relation to the wide-spread scope of well-being and the subjective mastery of life which generated results that can be linked to wisdom. Research from the HeartMath Institute and Antonovsky's theoretical frame of salutogenesis exemplify this approach.[8] The HeartMath Institute's research shows interactions between the neurons in the heart leading to a state of psychophysiological coherence that showed a significant improvement in cognitive performance, including memory and even academic test performance (McCraty, Atkinson, Tomasino, & Bradley, 2009). Another effect that is ascribed to a high coherence between heart and brain interaction is its positive impact on helping to maintain a person's mental, emotional, physical and spiritual well-being. The research acknowledges the impact of positive emotion and introduces the term *heart rhythm coherence hypothesis* that verifies that the higher the degree of emotional stability and system-wide coherence, the better is the facilitation of cognitive and task performance" (ibid.). HeartMath Institute research claims that "emotional coherence - a harmonious state of sustained, self-modulated positive emotion - is a primary driver of the beneficial changes in physiological function that produce improved performance and overall well-being" (ibid., p. 15).

The sense of coherence (SOC) in Antonovsky`s principle of salutogenesis describes and measures a person`s subjective way of making sense of one's own life and the world. It is also an indicator and major factor in defining how well a person copes with stress and stays healthy (Antonovsky, 1979, 1987; Bengel, Strittmatter & Willmann, 2001; Petzold, 2010). Adolescence is the period of life where the SOC is still open for changes while it becomes more settled (static) around the age of thirty (Antonovsky, 1979, 1987). The SOC consists of three factors; comprehensibility, manageability and meaningfulness. A strong SOC indicates an ability to orientate in the world (comprehensibility), ability to activate resources and master certain situations (manageability), acknowledging life and its challenges as something meaningful and put energy into the solution of problems (meaningfulness) (Fritz-Schubert, 2011a, 2011b). The increase of the SOC is an explicit goal of the Glück curriculum and is regularly evaluated (ibid.).

Although two different starting points – the HeartMarth research is based on the psychophysiological concept of coherence and Antonovsky´s model of salutogenesis on coherence as a psychological concept – it appears that both approaches resonate with the development of skills that fuel wisdom-related knowledge and performance. Both approaches point to states of enhanced awareness and wholeness that can initiate maturation processes. Wisdom is related to receptivity to imagination, intuition, and the kind of thinking and knowing that is below the neck.

What shaped my understanding of the concept of wisdom is that is in an interconnected relationship with the heart`s intuitive intelligence (McCraty, Atkinson, Tomasino, & Bradley, 2009), and feeling coherent in oneself and one`s decisions. Coherence manifests itself as balance, harmony, flow, integration, structure, being in sync, an enhanced sense of intuition, and system-wide alignment within. All these are qualities that are aligned with the presence and attention necessary to turn inward, be able to engage the inner landscape, hold that in a good space, surrender and transcend the ego. Incoherence in contrast creates disruption, disintegration, stress, and disharmony. It appears that a developing coherence in consciousness is characterized by psychophysiological, system-wide coherence embracing mental, emotional, physical and spiritual wellbeing and resilience (ibid.). A high SOC score in Antonovsky`s salutogenesis` three terms comprehensibility, manageability and meaningfulness also seems to be interrelated to a developing coherent consciousness.[9]

---

[8] Antonovsky's work is an explicit part of the Gluck theoretical foundations. The HeartMath research is not, but seems relevant enough to also mention here.

Another possible interrelation is that the three components of the salutogenic frame – comprehensibility, manageability and meaningfulness – contextualized in the Glück curriculum can be seen in a connection to what wisdom theorists define as *wisdom criteria*. Expert knowledge, referring to the meaning and conduct of life, approaches wisdom if it meets these five criteria (Kunzmann & Baltes, 2005), which are (1) rich factual knowledge, (2) rich procedural knowledge, (3) lifespan contextualism, (4) valuation of relativism and (5) tolerance and ability to understand and manage uncertainty. While the two first criteria are on a basic level and not sufficient for the development of wisdom-related knowledge, the three last criteria are meta-level criteria. They require a broader body of experiences and learning to embody than the basic level criteria. Considering the contents of the three terms in the salutogenic framework it seems that the five wisdom criteria not only fit the aspired outcome of the Glück curriculum but resonate with the contents of the wisdom criteria. They give clues to how a person engages her/ his social and physical environment and makes decisions in certain domains.

Putting it all together and looking at the interconnection of the three components – the accomplishment of life tasks, the theoretical background of Glück and wisdom theory – a fluent orchestration of these components defines the zone for the cultivation of wisdom. Existing research from the University of Mannheim[10] showed that Glück had a positive effect on the students` subjective well-being but also described one confinement in relation to the individuals` emotional stability. The interviews with 106 students showed that the higher the degree of emotional stability in the individual before the accomplishment of the Glück curriculum, the higher was the positive outcome for the individual. This puts the notion that happiness is something one can learn into something we have to look at in relation to where the individual is at and consider that the classrooms are filled with individuals so that this statement must not be overgeneralized.

The essence of my research arose in the process of observing classes and listening to the narratives in group discussions as well as in interviews. Exploring the lectures and scrutinizing the interviews for signs of transformational processes gave a more holistic picture of what I perceived as a synthesis of foundational life stage criteria exposed to a conceptual frame which is embedded in the constructivist developmental framework. The holding environment created a space for reflection and critical-analytical thought. Integrating and looking beyond the theories about the development of children's` and adolescents` capacities and life tasks, I was interested in the concept that regulated the use of these capacities besides their subjective well-being.

---

[9] Seeing these two notions of coherence, it would be interesting for future research to explore the degree to which there is an overlap between the concepts of coherence when considering heart and brain interactions and the salutogenic framework, or if a feeling of a sensed incoherence actually also contributes to the development of wisdom-related knowledge.

[10] http://www.uni-mannheim.de/1/presse_uni_medien/pressemitteilungen/2011/august/unterricht_zum_gluecklichsein/druckversion_pi52/08_08_unterricht_zum_glacklichsein.pdf

My Observations and Interview Approach

I interviewed seven students who were between 17 and 20 years old (3 female, 4 male) and two teachers. Before picking a sample of interviewees, I was told that the students were already quite used to giving interviews as the media had shown a lot of interest in the implementation of Glück. It turned out that this was an essential factor when doing the interviews. The students' personal narratives revealed more of how their perception and subjective experience of the Glück curriculum related to the development of skills related to wisdom-related knowledge. They also disclosed more about their process of discovering their relation to their own meaning making.

Interviewing Adolescents: Critical Reflection vs. Descriptive Cheerleading

The semi-structured interview guide contained questions to find out about what motivated the adolescents, what they learned in class, if and how they applied what they learned related to their everyday life, and how they experienced the lessons as a means in order to develop certain abilities. The main purpose of the interviews was to stimulate the students' reflective thinking through facilitating their process to gain broader insights into how and in which ways their attendance of Glück helped them in relation to wisdom-related criteria.

The presupposition for this was to help them find a language to describe their subjective experiences. My motivation was to help them go beyond a "flat" description of the class and give rich answers of what revealed itself. Framing the interviews to each of them as a possibility to reflect about their insights, impressions and feelings towards Glück before the start of the interviews, I proposed to each of them that these conversations can be a possibility to go deeper into layers that maybe they had not considered to talk about before. All of them accepted this proposal very openly and gave verbal and non-verbal signals that they were interested in a deeper self-inquiry.

However, when conducting the interviews, I observed that there were discrepancies between the students` way to respond to the questions. While some of the students showed not so much variation in their answers and gave responses which had more of a descriptive nature, other students answered in a more critical manner than I had expected, reasoning abstractly. The interest of the media might have caused that some of the interviewees were kind of "trained" or "programmed," and more descriptive in their interviews rather than reflective and critical. It was probably unconscious that their narratives were more aligned to a good description of the Glück curriculum rather than their own subjective meaning making. The other students who had been more reflective brought another nuance and broader approach to my research as their critical attitude displayed more critical-reflective skills which eventually revealed more of a transformational process going on in them.

Limitations of the Research Study

In my research study, there are a number of limitations I am aware of. Due to the wide spectrum of definitions and theories about wisdom in recent literature, I had to make choices in order to narrow down the scope of my research field. This resulted in a strict limitation of the theoretical lenses I used. Thus there could be other perspectives and interpretations of my data that I missed by narrowing the scope of theoretical lenses. The main limitation I perceive, is that I have built an extensive theoretical model and interpretation based on a relatively small amount of empirical data. The fact that my study turned out to focus mainly on two participants, who appeared to give the richer data in relation to my research question could be seen as problematic. It also turned out that two of my interviewees did only in some marginal areas mirror the overall impression I got from the rest of their group. They were supportive for the data, and stayed more in the background of the analysis. This is a limitation of the study as it might appear not broadly representative.

Future Research

The limitations in my thesis open the way for more research to corroborate and sustain the empirical findings that emerged this research study. Having the major impressions from my research study and acknowledging the importance of development and impact of wisdom on young people, I would propose a long-term study of a research sample attending Glück and examine their subjective experiences succeeding through the wide-spread scope of items the Glück curriculum focuses on. One step of this could be following up and interviewing more students at the end of their two year program. Another possibility for future research is a deeper examination of what the concept of coherence used by the HeartMath Institute and Antonovsky’s salutogenesis might have in common.

Description of the Findings

The empirical data showed that generally speaking, the participants perceived the Glück curriculum as both useful for their development and applicable in everyday situations. They also perceived it as a useful learning arena beyond their traditional school curriculum. All of them mentioned and appreciated that in Glück they do not have to stay quiet but are encouraged to speak up and that they get a feeling for who they are. Regarding their subjective perception of their development the following key findings emerged.

- The Glück curriculum helps the adolescents to use and refine tacit knowledge which suggests that Glück teaches for gaining a higher degree of wisdom-related knowledge.
- The process of reflection, generalization and development of self-awareness changed the adolescents’ subjective perception of their own outcome of their attendance in Glück.
- The process of reflection, generalization and development of self-awareness also helped to develop their understanding of lived key experiences in a larger life context.
- Developing more self-awareness and understanding for the impact of the Glück curriculum revealed developmental growth going on in a parallel mode.

The key findings display fine grained transitions between each other as the students` answers displayed that development happened in nuances and a small range. The data implies that one course of Glück will not totally transform them. But what I found was that zooming in on details in the scope of a broader scheme of wisdom, adolescence`s life tasks, transformation and the curriculum, small changes emerged.

Talking highly appreciatively about the good companionship and the safe container in class, all students disclosed that their individual and collective awareness seemed to have enhanced. More perspective taking, knowing oneself better and reacting differently in difficult situations was mentioned in particular. They also talked about an improvement of skills that support teamwork and team spirit in general, a better social aptitude, self-esteem and self-efficacy. All of the interviewed adolescents proposed that Glück has a potential to nurture these qualities but stated that they do not ascribe the development of these abilities only to Glück. There was a consensus that they already came with certain capabilities before the Glück curriculum was introduced to them. It seems that even if they assert their own sense of self and growth as not exclusively attributed to their attendance of the Glück classes, but maybe going on in a parallel mode, there is a chance that it nonetheless helped them become aware and articulate this certain outcome.

It looks as if Glück was somehow involved in helping them find a language for something that they notice to have had in themselves from before. Framing it might have helped them validate their assertiveness in their verbal and nonverbal responses. This certain tacit knowledge might have been pushed more into the foreground as it became more explicit through their self-inquiry and being exposed to the curriculum. The meaning making in their chain of thought showed more complexity as the interviews progressed. They took time to reflect and be present with their inner dialogue which showed in their facial and vocal expressions as sighing, giggling and their moments of silence. These expressions were important data and were a fully integrated part of the transcriptions and analysis. Being mindful of their body language during the interviews and listening to the recordings of the interviews over and over again also helped me to deepen my understanding of their process.

The moments of reflective silence in the interviews can be seen as beginnings of learnings felt in the pre-reflective experience of negativity that is a transformational break with the own learning history and habitual mode of being (English, 2012).

> These breaks or gaps in experience cannot simply be closed by attaining new knowledge, but they can be productively dealt with through reflection and inquiry. Learning begins in the breaks and gaps in experience and come forth as a “response to the call of the other.” (p. 221)

I observed that the reluctant attitude some of the participants showed initially towards the curriculum turned into something that was much more neutral, and in some cases even very positive. As soon as they had started to articulate their experiences and what changes they noticed since the first day in Glück they made this knowledge more explicit. Their narratives brought them from their critical feelings to a more authentic space where their criticism was not just there for the sake of being critical. Some narratives brought forth elements of cognitive dissonance to deal with. Contextualizing the new perspectives actually expanded the container and gave another quality and nature to it. Holding this tension, a higher level of self-awareness and authenticity could emerge.

Deep contact with oneself and others in the context of the classroom helped them build a better understanding for who they are, their inner world, their strengths and weaknesses and about their abilities to build and maintain relationships. Building and balancing their knowledge about their relationships supported their process of enhancing their awareness about themselves on three levels; individually, collectively and inter-relationally.

Glück helped the students to discover, refine and internalize new skills and learnings. Parts of these learning processes had been going on in a parallel mode. Reflecting upon the curriculum, the key experiences and the impacts of Glück in their lives helped making this knowledge more explicit and tangible to them.

It also supported enhancing their ability to listen to the gut feelings. Their sense of their self as an individual and in a community and of actively being a co-creator for the greater good was mentioned to have matured throughout the program.

Description of the Model Emerging from the Findings

In the research process, three main categories with appertaining subcategories emerged; (1) Criticism with the subcategories “assertiveness” and “ rejection”, (2) Social interaction with the subcategories “learning together” and ”safe container”, and (3) Skill development with the subcategories “abstraction”, ”reflection”, and ”self-awareness”. The latter, skill development, along with its subcategories, revealed itself as a level that enabled the students to enter a space where their skills synthesized in order to become a presupposition for wise acting.

Analyzing the data led to the conceptualization of a model exploring the stages in the evolution of wise acting.

Abstraction → Reflection → Self-Awareness → Wise Acting

The model illustrates the individual`s inner process and synthesis of the pronounced subcategories abstraction, reflection and self-awareness as a stepwise model aiming for wisdom at the peak position. It depicts a possible developmental process of an interior operation which I assume to lead to the possibility of cultivating wisdom and focuses on the individual`s inner condition enabling skill acquisition and skill refinement in relation to this. The quality of this subjective inner condition is an expression of the individual`s level of “knowing-how” which is related to the level of wisdom-related knowledge and performance. Its quality also governs the learning going on in parallel.

The other main categories of criticism and social interaction appear to establish a frame for the model in the background. They reveal themselves as external but with indirect and supportive influence on the internal operation illustrated in the model above. Criticism’s subcategories assertiveness and rejection illustrate the adolescents’ embeddedness in a thought pattern (a frame of reference) they are held by. The critical perspective is in relation to the stages in the evolution of wise acting in the model as it stimulates the adolescents' abstract and reflective thinking. The social interaction's relation to the interior process in the model is the creation of the interpersonal dynamic conditions that enable the accomplishment of the internal operation.

Abstraction

The first step of the model is abstraction. The development of abstract thinking is part of the formal operational stage (Piaget, 1954). The formal operational stage begins approximately at an age of eleven and lasts into adulthood. Being in their late adolescence the participating students are therefore supposed to already have developed the ability for abstraction which implies a capacity to make use of concepts, draw logical conclusions from what is observed, understand generalizations and make distinctions. Assuming that all of the interviewed adolescents have successfully gained mastery over the development of abstract thinking, it seems to be mirrored in the way they related to the interview dialogue.

Clear distinctions were made when framing and re-framing impressions of how exercises and certain activities were perceived. Learning how to frame well is conducive to becoming wise, and implies a capacity that enables the human to recognize and discern what is important when having to face decisions (Schwartz & Sharpe, 2010).

The students' selective perception of the differences in attending Glück in comparison to attending other traditional school subjects showed the ability for abstract thought. One of them said "The other school subjects are exclusively about the particular subject matter and which grade you get in the exam, while in Glück it is about how you engage and how you act in relation to others." Several exercises and activities purposes, their significance and relevance according to appropriate timing for their implementation were mentioned and inquired for their meaning in the context of the classroom. The ability to contextualize and reason logically was part of the process to actually understand what concept was behind the exercises and let their narrative shape their meaning making. Sternberg (2001) states that the fundamental idea behind bringing the cultivation of wisdom into the classroom is that teaching is not about telling the students *what* to think, but rather teach them *how* to think. Constructing learning in a wisdom-based approach to teaching, considering their own and other's points of view is essential in order to actively promote learning and a balanced understanding instead of egocentrism (Sternberg et al., 2011).

In relation to the model, the students´ capability for abstract thought was expressed in the way they reasoned logically and generalized the outcome by looking at it as beneficial for situations in the future. Their age-appropriate natural intellectual demand for generalization, logical thought and abstract conceptualization was stimulated by the critical standpoint they had towards the accomplishment of Glück. Being exposed to the curriculum and relating to the feelings coming up seemed to help them conceptualize new learnings through processes of interpretation and meaning making (Mezirow, 1990).

Understanding the concepts and making generalizations of the exercises' outcomes and purposes would contribute to their understanding of what they actually learned when doing the exercises. The ability to conceptualize, generalize and reason logically is a presupposition for framing and re-framing experiences and feelings, understanding them, widening the consciousness horizon in order to be able to act wisely. The learnings the adolescents get from generalizing wisdom-related experiences will benefit their ability to develop a coherent view on their life according to the role these experiences have in a bigger picture or life context. (Richardson, & Pasupathi, 2005).

Critical reflection requires the ability to make abstractions. Abstract thought appears to introduce self-inquiry and be the bridge to critical reflection in order to make sense of experiences, make them objects of reflection and make the learning tangible that way. Here the journey to wisdom might begin when the seed for wisdom gets nurtured.

Reflection

There seems to be a smooth transition from abstraction to the second step, reflection. The interference of the critical-reflective thought was stimulated through the adolescents' ability to abstract, make distinctions, generalize and conceptualize their experiences. Generalizing and reflecting upon experiences in class, in the reflection paper homework or the interviews, the gathered data could be arranged and re- arranged as an internal process in order to make interpretations (Mezirow, 1990) and judgments which can lead to general shifts from negative to positive outcomes (Pasupathi, et al., 2001).

While some of the students had a critical to neutral attitude to Glück in the start of the interviews, deeper questioning made them go from a factual description of Glück into personal stories and how they act or re-act in their everyday lives. Their attitude changed to being more adaptive or neutral-accepting towards the curriculum and they did actually name concrete changes of behavior.

Generalizing the experience and making intense reflection about it seemed to have touched the students' ability to take a meta-perspective, recognize the possibility of certain different viewpoints and the ability to re-consider assumptions by taking them as an object of reflection. Especially for one of the students in the second group, this process might have been triggered by recognizing a tacit underlying pattern that ran him and made him create assumptions. Embeddedness in one's own subjective perspective (Kegan, 1994) would exclude an objective view that often is related to the development of self-awareness (Jordan, 2002). Recognizing a variety of different points of view and then developing a holistic and ecological awareness is typical for wise persons (Csikszentmihalyi & Rathunde, 1990).

Through reframing the judgments about the curriculum the student's initial rejection was put into more workable terms. The student "relocated" himself on another level towards it and became more agile in his way to look at the class and its impact on him as soon as he suspended his former assumption about the curriculum. It resulted in gaining more awareness of a holistic picture and interconnections which contributed to the student no longer being had by his initial averseness.

When telling and retelling different kinds of incidents or experiences from their lives outside school and what kind of meaning this left in relation to their everyday consciousness they seem to have developed an ability to reframe unclarified experiences. This way of reframing these unclear situations might transform this person when allowing them to step into a space of self-inquiry. Part of their reflection was putting new insights into more workable terms and generating conceptualizations of the outcomes. This process of deep self-inquiry included the recognition and integration of new knowledge.

Being critical and reflective seems to include taking action, being explicit and making choices on behalf of oneself. Hooks (2010) claims that "this insistence on self-responsibility is vital practical wisdom. The vital link between critical thinking and practical wisdom is the insistence on the interdependent nature of theory and fact coupled with the awareness that knowledge cannot be separated from experience" (p. 185). It seems that the adolescents' logical, critical thinking coupled with new insights and internalization, embodiment of learnings through lived experiences that they gained in reflections have contributed to reach a higher level of knowledge, a cultivation of tacit knowledge that is related to practical wisdom. In that case certain activities and exercises that are accomplished in the Glück curriculum and are accessible for reflection help to make the refinement of certain wisdom-related skills explicit.

The more a person reflects upon matters by taking them as an object of reflection the more complex will the view on the world and life in general become as one refines the capability to see, recognize and act on things (Kegan, 1994). This notion can be linked to a process of transition to the next step, self-awareness.

Self-Awareness

This section will focus on the deeper layers of the students´ process of developing self-awareness. Some additional connections will be interlaced as many of the components presented in this article are essential for the development of consciousness and change.

The transition from reflection to building up a higher level of awareness is smooth. The nature of critical reflection is to question the presuppositions on which our beliefs have been built (Mezirow, 1990) which resonates with being open-minded to recognizing assumptions by self-inquiring reflection. Three of the adolescents sometimes expressed an explicit unclarity about assumptions or about what drove them according to a certain matter. Svantesvoll (2011) describes passive and active modes of experience. Being subject to something and being unable to make distinctions refers to passivity. In contrast, having a conscious and clear relationship to the experience and being object to refers to the active mode. It seems that the reflection and re-reflection going on in the interviews when answering questions or telling stories sharpened the students` skills to acknowledge new learning and have insights about the outcome of Glück by making this transition from the passive to the active way of relating to their experience. Of course, these shifts are part of a longer process and require the exposure to all kinds of experiences rich in learning. The students might have been "ripe" to be scaffolded into shifting modes in the interviews.

Noticing that they were a bit "trained" to talk in public about Glück, I realized it would be necessary to try to lift their attention and focus up a bit to their actual subjective experience of the learnings they described. All of the adolescents had acknowledged at a certain point a discrepancy between what the assumption in the start was and what they came to through the interview. This discrepancy alludes to this initial unconsciousness in the passive mode (Svantesvoll, 2011) of what was going on inside them which turned into insights after they had successfully conceptualized the experience representing the active mode. Putting this together, and from a developmental point of view, wisdom-related knowledge happens through these micro shifts in consciousness. The kind of information that is anchored as tacit knowledge is brought to awareness and made explicit. Through this shift it is available for wiser decision making.

Although there was no exuberant enthusiasm in the answers flowing into an epiphany of a ground breaking experience, there are certain signs of small developmental changes going on in them. Having these experiences of insights includes that the adolescents have developed a higher level of consciousness in relation to them by taking them as an object of reflection. Examining their assumptions revealed emerging structures of awareness that resonates with subject-object psychology.

An important aspect in their development of awareness for the others' needs and their own self-awareness was accomplishing certain exercises which resulted in the embodiment of new learnings. Physical experiences like the "Free Fall" and the "Value Hierarchy" were mentioned to contain a special component that made the learning experience tangible. When being fully engaged in group processes, collaborating towards a common understanding or goal, finding solutions together, communicating and integrating all different points of view as a part of the group process make the experience of the new learning something that can be internalized. Having been part of that process can open a space for an embodiment of new knowledge on a deeper level.

As knowledge cannot be separated from experience (Hooks, 2010; Sternberg, et al., 2011) it gives these practical key experiences in such processes a strong space in order to gain more practical wisdom when successfully, or not that successfully, interacting with others. Such learning experiences are often dependent on a holding environment. The holding environment of the container enables the individual to build up certain capacities as for example gain awareness, open up, take action and learn from each other. This way the container provides a possibility to immerse into deeper layers in inter – and intrapersonal relationships that can help to foster wisdom-related knowledge and action. Making experiences with others that creates this kind of knowledge in oneself or others is related to wisdom and requires the expertise to understand situations in an insightful and wise manner (Sternberg, 2003).

The Inner Conditions and Processes that Facilitate Wise Acting

It is my belief that proceeding thoroughly through the steps of the model – abstraction, reflection, self-awareness – will at some point lead the individual to an ability for wise acting. These internal processes, which are necessary to start this journey, constitute the inner condition of the adolescent. The quality of this subjective inner condition is an expression of their "knowing-how", and it is facilitating the move from the passive to the active mode of learning (Svantesvoll, 2011) which comes along with the subject-object shift (Kegan, 1982; 1994). It also governs the learning going on in the parallel mode mentioned earlier. Glück tries to foster the inner conditions and promote the individuals´ shift of their current capacities which gives them more conscious choices, and can contribute to wise acting.

The rise of self-awareness will encompass an additional process in a parallel mode because the newly gained and higher degree of openness enables the appreciation of others’ sphere of perception as well (Hart, 2009). As the adolescent gains new awareness progressing through each succeeding stage in the model, a space for new insights and learnings opens up. When being able to free oneself from the contents of awareness, the development of meta-awareness (which is an awareness of awareness) can emerge (Jordan, 2002).

The culmination of this model, which illustrates the adolescents’ ability for wise acting, is conditional upon all of the previous stages in the model. Through reflection on the data it appears that a successful mastery of all the previous stages seems to be essential for the increase of the adolescent`s ability to enter a higher level of wisdom-related knowledge and performance.

The model makes an attempt to depict the adolescents` interior process as a part of this development. Adolescence and young adulthood are sensitive and turbulent life stages with many changes and challenges regarding personal development and societal demands. Relating to, navigating and mastering these changes and challenges functions as a platform for the individual to make, balance and evaluate key experiences which is critical for the cultivation of wisdom.

Discussion

In this article I have argued that the development of wisdom-related knowledge can be a parallel process to the development of happiness. Both, becoming happier and wiser are dependent on certain circumstances that initiate developmental growth processes. One of the findings in this small research project was that some of the students` narratives revealed that a certain degree of uncertainty about their acting or being in the world was more in play than for other students whose narratives referred to more difficult life circumstances or an exposure to a broader range of experiences.

Analyzing the data showed that turning inwardly in processes of reflection, generalization, and the development of self-awareness in that young age supports the development of understanding lived key experiences in a larger life context. It also clarified that the exposure to the Glück curriculum helped them listen to, refine and use tacit knowledge, and make it more explicit. Operating upon experiences and internal processes demands certain skills such as critical-reflective thinking but an ability to orchestrate these, allowing for a certain shift in the young person`s mindset to happen. As well, a safe container assuring a holding environment is also necessary. Thus, the cultivation of wisdom in adolescence requires the consideration of age-appropriate wisdom-related learning and the appropriate conditions of support.

Glück has apparently triggered something in the students that goes beyond the accomplishment of rapid information learning techniques that are often emphasized in modern society. A broader body of knowledge and a growing awareness about their own inner condition that promoted change in them made some important learning tangible enough for a closer inquiry. What I hypothesize is that reflection and generalization of the impression of the key experiences facilitated their inner condition by nurturing the tacit knowledge and opened for the acquisition of age appropriate wisdom-related skills.

The model helps understand the development of age appropriate wisdom-related skills considering the interviewees` developmental stage, their life phase, and personal features. Proceeding through the stages facilitates vertical development, the kind of learning that relates to how to think differently, see the world through a new lens, and transform the architecture of the current way of knowing. This developmental step resonates with subject-object-psychology and proposes in this research study the adolescents` renunciation from their ego-centric perspective to a broader, more open perspective. They show signs of making tacit knowledge more explicit, gaining a finer grained perception of who they are, and how they show up in the world.

Understanding the development of age appropriate wisdom through this model requires to look at the internal processes that constitute and balance the individual`s inner condition. The quality of these internal processes and inner condition is an expression for the quality of their vertical development.

This perspective on wisdom parallels other views like developmental theory. Wisdom-related thought appears to be intertwined with the capacities Kegan proposes to be necessary to cope with the mental demands of transitioning from adolescence to adulthood. To sum up, it is likely that people of that young age have not had as many possibilities to make generalizations from all sorts of lived experiences as older people might have. Developmental theorists might claim that a certain age and a certain developmental stage is a presupposition for acting wise but adolescence is a period that should not be underestimated. There are currents in adolescence (usually represented in Kegan`s second and third stage of development) that advocate for a strong standpoint in this assertion. Looking back on Antonovsky`s theory of Sense of Coherence, adolescence is the life phase in which the SOC is characterized by openness for changes before it in adulthood tends to consolidate and become steady (Antonovsky, 1979, 1987).

This research study showed evidence that the multidimensional approach of the curriculum and holding environment can facilitate the cultivation of wisdom. It nurtures the naturally given developmental features and tasks of this life phase. Its multidimensional approach supports the individuals’ process of developing and cultivating wisdom. The students` age appropriate and natural intellectual demand for logical and critical-analytical thought, abstract conceptualization, discernment and discrimination, generalization and individuation facilitate the way the conditions that enable developmental growth that leads to wise acting. In order to orchestrate these arising demands and abilities and allowing for the refinement of tacit knowledge into explicit knowledge, the cultivation of wisdom requires an age appropriate wisdom-related learning.

The students who had initially expressed a critical view towards Glück had been subject to this emotion and were to a degree identified with it in the start. The reflection upon the positive key experiences and outcomes triggered some distinction making in them so that their attitude eventually shifted to be more neutral and even positive towards the curriculum. Revising and making a new interpretation of experiences` meaning (Mezirow, 1990) will create learning, unravel and transform the prior way of knowing and move towards deeper understanding, wisdom, and more effectiveness in the world (Cook-Greuter, 2004).

The learning that went on in parallel in them is part of their unconscious learning processes. The cultivation of knowledge is a dynamic activity where the articulation of tacit knowledge makes it more explicit to the learner. This means that the new knowledge is crystallized and more tangible to put in a context or in action. In order to internalize new knowledge it has to be embodied and owned.

Inquiring into how Glück could be accelerating the cultivation of wisdom as distinct from normative stage – and age-related development, requires zooming back out on the curriculum`s holistic nature, scaffolding and its roots. Informed by Positive Psychology and the multi-disciplinary approach to learning it meets the deep inner longing for emotions that are attuned to being positive and becoming oneself as the core to leading a happy life. Actively experiencing one's own learning and growth curve initiates a sense of self-worth and confidence in meeting the world´s challenges. It conveys the feeling of being the author of one`s own biography.

The Glück curriculum does not use the term "wisdom" explicitly in its make up, but emphasizes happiness. The hypothesis for this article is that providing students with a formal educational context where they can learn to formulate their own perspective on what constitutes positive emotions will also show parallels to an equivalent process in wise thinking. The scaffolding provided by the teacher can help the students to develop wisdom, but there is no formal course of actions or "to do list" (Sternberg, Jarvin, & Reznitskaya, 2008). The scaffolding can in these ways initiate and support this learning curve while the student´s process is to go through stages that define the own new perspectives. Constructivist agendas highlight scaffolding as relevant to the acquisition of wisdom (Palincsar & Brown, 1984, 1988). Going through the curriculum can give the students tools which can give them a better foundation for wise acting later in life. Putting these considerations from above together, it can be seen that the concept of Bildung expands and includes more aspects of the whole person rather than excluding them.

Contemplating on how a school subject like Glück might have helped me in my teenage years, I believe that it would have had a very positive impact on my perspective on life and my own being in the world. Of course, all this is hypothetical, but I believe I would have learned to be less inclined to my self-limiting beliefs, be more detached (from social pressure), feel less socially awkward, less shy, more pro-active, less prone to negative biases caused by my low self-esteem, and I guess I would have been more serene to engage the world with less anxiety to not perform well enough. The list is long, as I struggled with the whole range of things a teenager can struggle with. I tend to be sure that I would have built skills much earlier to grow detached from these issues and assumptions. I would have been more self-aware. I guess I might have acted wiser sometimes. I was not a bad student but honestly, I tend to remember the not so good experiences from school. I see clearer now how much of a difference the emphasis on positive emotions and positive key experiences in the safe container of a classroom can make. In hindsight I think that school would not have been such a deterrent to what I would consider now as relevant learning. Learning for life would have been such a different and more appealing approach than learning for the next exam!

Much Madness is Divinest Sense: Wisdom and Development

Caroline Bassett[1]

Abstract: No one has yet come up with a complete understanding of wisdom. We can approximate it, we can circle it, we can gaze at it longingly, we can try to seize it with both hands. In my attempt to understand wisdom, I look at it through several different lenses – recent research into measures of wisdom, the discoveries of neuroscience, integral theory, post-conventional development, how wisdom operates in daily life, and my own findings. They include my four-part model and my assertion that wisdom lies on a continuum from rare and rarefied to humble and pragmatic. Finally, I discuss how individuals can enhance their own wisdom and encourage it in others.
Wisdom is large; it contains multitudes.

Keywords: Adult development, brain research, knowledge, practical, useful, wisdom, wise.

Life by Emily Dickinson

MUCH madness is divinest sense
To a discerning eye;
Much sense the starkest madness.
'Tis the majority
In this, as all, prevails.
Assent, and you are sane;
Demur, – you 're straightway dangerous,
And handled with a chain.

Emily Dickinson tells us a lot about wisdom in this short poem, although it is entitled *Life*. To those with a discerning eye, those who can see more deeply into the mystery of things and into the patterns that lie therein, those people see something that makes sense where others behold only randomness and chaos. However, in most cases in our world, the view of the majority prevails, and those with discerning eyes can be considered not to be trusted – not promoted, not voted for, not accepted in the conventional world.

---

[1] **Caroline Bassett, Ph.D.,** founder and Director of The Wisdom Institute, has been studying wisdom for more than a dozen years. She teaches, writes, and speaks about this topic with a focus on wisdom that we can use in our everyday lives. Happily at home in Minneapolis because she likes culture and nature, both of which are easily at hand, she gardens, bikes, swims, cross-country skis, and reads a lot, finding wisdom here and there. She also teaches at Capella and Walden Universities working with doctoral students on their dissertations.

SOME RIGHTS RESERVED

How often have we seen those with keener sight shunned by society, if not killed? I am thinking, of course, of Jesus and Gandhi and Martin Luther King, Jr. But not all. Some are accorded the greatest respect, such as the Buddha who lived to a ripe old age. Eleanor Roosevelt with her compassion and action for the disadvantaged died in her later years, and Nelson Mandela lived into his 90's. The Nobel Peace Prize winner of 1991, Aung San Suu Kyi of Burma, continues her work to lead her country towards democracy.

I give examples above of those we perceive as model and exceptional human beings. Yet in my view, wisdom is not limited to people like them. Wisdom is a real thing for real people, people like you and me, although the scope and impact of our wisdom likely will not be as broad and deep as theirs.

Some years ago I began to wonder about wisdom, what it is, and how we can know it. How can we understand wisdom? But then, after reflection, I realized that understanding wisdom requires a broad brush approach – one cannot know it by one method only. Hence, I changed the question to this: "How can we see wisdom?" deliberately using the verb "to see" as more inclusive than understanding, which is a primarily cognitive activity. In order to see wisdom in its complexity and subtlety, we need a more comprehensive approach.

Hence, I devised a taxonomy of three basic approaches to seeing wisdom (Bassett, 2006, p. 283). They include what I called then the *metaphysical* side (non-empirical reality) that comprises philosophy and theology/religious studies. On the *word arts* side we have myths and folk sayings, the literary arts, and biography. Finally, on the *analytical* side, we find conceptual/theoretical/descriptive approaches as well as empirical ones (though the two are related), which include practical knowledge/expertise, developmental, and personal attributes of wisdom. Thus, we can find wisdom in philosophy and religion; in myths, novels, poetry, other arts; and we can try to understand it more directly using analytical techniques.

Since that publication, however, I have re-conceptualized the taxonomy and changed it in a major way – into a spectrum where we see wisdom but with different colors, so to speak. On one end (the ultraviolet, to continue with the metaphor) we have descriptions of wisdom or words about it, such as philosophy, myth, and inspiration from the religions of the world. We would also find biographies of people considered wise, as well as the analytical approach, that is, conceptual, theoretical, or research-based studies of wisdom. At the other end, the infrared, we find direct experience of wisdom through, for example, the arts. I am thinking of Emily Dickinson's poem above and much of the wisdom (and folly) that we find in great literature. This direct apperception is not limited, however, to the literary arts. Wisdom can be found in music, in the visual arts (take a look at Michelangelo's *Creation of Adam* where Sophia, the original goddess of wisdom, appears under God's left arm – she is the closest being to him), and other media, as well as in observing wisdom in the actions of people near or far. One source of finding such people would be in the lives of some Nobel Peace Prize winners and other historical figures for whom there is some consensus of wisdom. I believe that we should notice and pay attention to specific people to see how they actually manifest wisdom. Few researchers do this.

Thus, how we see wisdom depends upon which wave lengths our eyes pick up and what we are attuned to – is it religious texts, research studies, Shakespeare, or actual people who seem wise? Different people will see different parts of the spectrum while other parts of it will remain opaque or invisible to them.

In this article, I will be focusing on the analytical approach, although the quote above by Emily Dickinson captures what wisdom looks like better than any definition I know. It gives us the flavor of it, the taste of it, the zing of it, what we experience when we encounter wisdom – and also the threat of it to the status quo (think of Abraham Lincoln and Martin Luther King Jr.). We should not forget this aspect of wisdom.

To be able to focus better, we will look at wisdom through several different lenses. I begin with the lens of definitions of wisdom and the Emergent Wisdom Model which expands upon my definition. Next we look at some ways of measuring wisdom and the findings of neuroscience and the brain, then move on to integral theory and post-conventional development. We will also explore everyday wisdom as well as wisdom seen through my own lens, that is, what I have learned about it in my years of studying it.

Wisdom through the Lens of Some Definitions of Wisdom and a Model of Wisdom

Wisdom, such a complex, abstract, and elusive construct! So many definitions for it, so many more ideas about it, so many associations with it – aphorisms, sayings, words/concepts that seem to exemplify wisdom. They sound good, so they must be true. Here are some:

> "The only true wisdom is in knowing you know nothing."
> Socrates, *Apology*
>
> "Zi Gong [a disciple] asked: 'Is there any one word that could guide a person throughout life?' The Master replied: 'How about "reciprocity"'! Never impose on others what you would not choose for yourself."
> Confucius, *Analects* XV.24, tr. David Hinton
>
> "Winners never quit and quitters never win."
> Vince Lombardi (Lombardi, 2002)
>
> "Awe of the Lord is the beginning of wisdom."
> *Proverbs, 1:7*

But let's turn to scholars who study wisdom and who try to capture its allure and power in a sentence or two. Founded by the late Paul Baltes, the Berlin School, as it is known, is an organization with a well-known and robust research agenda for wisdom. These researchers use this definition, orienting towards wisdom as expert knowledge: "expert knowledge in the fundamental pragmatics of life permitting exceptional insight, judgment, and advice involving complex and uncertain matters of the human condition" (Baltes & Staudinger, 1993, p. 76). (What I find missing in this definition is reference to what most consider a key aspect of wisdom which is mention of the common good, that is, good results not only for self but also for others).

Robert Sternberg's complicated definition is quite inclusive: "Wisdom is defined as the application of intelligence, creativity, and knowledge as mediated by values toward the achievement of a common good through a *balance* among (a) intrapersonal, b) interpersonal, and (c) extrapersonal interests, over the (a) short- and (b) long-terms, in order to achieve a balance among (a) adaptation to existing environments, (b) shaping of existing environments, and (c) selection of new environments" (2007, p. 145). Thus, here we find wisdom as the application, the use of, not only intelligence and knowledge but also creativity to find a balance among these many elements: inside oneself (the intrapersonal), with others (interpersonal: people one knows, community, workplace), and in society at large including institutions, country, God (extrapersonal). It is important to note that, as he says, they are *mediated by values*, that is, by what is considered important and ethical. And, wisdom looks at both the short-term and the long-term so that a person can adapt if that is the best route to take and/or change the existing environment and/or choose a different environment if the existing one does not work/will not change. And it is all to move towards a common good.

A third major wisdom researcher, Monika Ardelt, has contributed her three-dimensional wisdom scale built from her definition of wisdom. (In the section on measures of wisdom I will discuss her three dimensional wisdom scale). For now, we can say that her definition includes three elements: the cognitive, the affective, and the reflective (Ardelt, 2003). Of these, the last, the reflective, is the most fundamental component as it informs the others because it encourages cognitive development through the ability to take multiple perspectives – to see things from different points of view. Further, through reflection, wiser people have learned how not to be so reactive in unpleasant situations, to accept the reality of the present moment, and to cope better (Ardelt, 2003). (Like the Berlin School's definition, this one lacks reference to a common good).

Walsh (2011) takes a different perspective, examining contemplative, cross-cultural, and integral contributions to concepts of wisdom. He distinguished between practical wisdom (*phronesis)* and *sophia,* where the former represents applied wisdom and the latter subjective or intuitive. In fact, he goes on to differentiate among different kinds of subjective wisdom, what he calls intuitive apprehension and conceptual understanding. The former is the kind of wisdom that can be gained intuitively, through observation of life, by people educated or not, intellectually developed or not. The latter, however, conceptual analysis, can enrich intuitions, he says, "by examining, extending, and articulating them, drawing out implications, and linking them into networks of insights and ideas" (Walsh, 2011, p. 123).

Yet, what *is* wisdom, according to Walsh? His definition of practical wisdom goes far: "practical wisdom is a function of skill in responding to the central existential issues of life in ways that enhance the deep well-being of all those that the responses affect" (Walsh, 2011, p. 122). According to his schema, what would a person with the conceptual understanding look like? How would her behavior differ from mine or anyone else's? Walsh could enhance his good work by selecting some specific individuals who have these qualities and describing how they manifest them.

Walsh's (2011) definition of practical wisdom resembles in many ways my own which reads like this: "Wisdom is having sufficient awareness in various situations and contexts to act in ways that enhance our common humanity" (Bassett, 2011a, p. 305). As I noted above, a person cannot be considered wise unless he or she shows repeated instances of the kind of behavior that is associated with wisdom, over time and in different kinds of circumstances. Wisdom is not a one-shot deal; once is a lucky accident. This is the first key component of the definition.

The second key component is reference to enhancing our common humanity or striving for good results not only for ourselves but for many others as well. By the phrase “common good” or “common humanity” I mean general conditions that are to everyone’s advantage. Granted, this “everyone” might not be every single person but it does suggest, I believe, that someone, Person A, for example, would prefer not to be in the place of someone else, Person B. What does this signify? Let’s take a look at slavery in the United States. Abolition would be better for the slaves but not for the slave-owners. However, I can bet everything I own that not one of them would willingly change places from owner to slave. The “general conditions” to everyone’s advantage are those that almost every single person would prefer.

However, it is the third component that is by far the most powerful and important – the two words “sufficient awareness.” “Sufficient awareness” means paying attention to what’s going on around oneself. It means seeing the environment and then seeing it again from several perspectives. Sufficient awareness is what leads us into the complexity of wisdom with various elements that each interact with any and all of the others. This is best shown by the Emergent Wisdom Model (Bassett, 2006, p. 295; Bassett, 2011a, p. 305) and reproduced below. In fact, the whole model *is* what sufficient awareness looks like – all of these elements working in concert with each other.

The model is based upon a grounded theory study that I did where I interviewed 24 individuals judged thoughtful and insightful in a modified snowball method. I call it “emergent” because, while the model cannot show it, the elements are in motion. They shift and change in relationship to each other with differing elements becoming more prominent at times, then fading into the background.

Interestingly, we can also see this model like a fractal: a scale-independent self-similarity. That is, no matter how large or how small the situation being contemplated is, the elements of wisdom will be present.

What is wisdom? All of this is wisdom, all of it combined and together. Each element is necessary but not sufficient. Each of the cells relates to, interacts with, influences, and is influenced by any and all of the others. Wisdom is both non-linear *and* dynamic**.** Thus, we can take any single cell and it will relate to any and all of the others. Just because Insight, for example, is listed in the first column does not mean that it has to do only with Discernment. It is also necessary for action and for self-knowledge. Embracing paradox relates to the Integration dimension, and it also is necessary to gain a deep understanding of patterns and to take multiple perspectives on a situation. At the same time, it is important to remember that this is just a model, that is, one person’s understanding of wisdom. Because wisdom is so complex, in reality there is certainly some messiness here, with categories overlapping and sliding around a bit.

Table 1. Emergent Wisdom Model © 2005 Caroline Bassett

WISDOM				
Dimension	**Discernment**	**Respect**	**Engagement**	**Integration**
Chief Descriptor	Objectivity	Due regard for the right of others to be	Involvement	Recognition of the integration of self into the whole Knowing that the self is part of many systems
Proficiency	Insight Holistic thinking, systemic seeing into complexity Balanced interests	Acceptance Multiple perspective-taking Compassion & caring/ Generosity of spirit/ non-judgmental	Sound judgment & adept decision-making Actions based on determinations of fairness & justice Moral courage	Self-knowledge Self-acceptance Reflection – opening to cognitive and non-cognitive mental spaces
Manifestation	Deep understanding of fundamental patterns and relationships, causes, and consequences	Sense of gratitude/ Expanded sphere of consideration	Committed action for the common good (general conditions that are to everyone's advantage)	Embracing of paradox & uncertainty Ability to see beyond the self Growing recognition of interdependence Integrity
Developmental Stimulus/ Queries	What's really going on? What are the facts? What's true? What's important? What's right?	Whose point of view am I taking? How does someone else understand reality? How can I relate to them with magnanimity?	What guides my actions? To what ends are my actions directed? What means do I use? What are the consequences of different decisions?	What are my values? How do I live them? Who or what is the "I" that I think I am? What am I part of? How can I get outside of myself so I can see more clearly?
WISDOM				

While I present my model as a chart, as stated previously, wisdom really is non-linear and three-dimensional. That is, each and every cell relates to any and all of the others. So, for example, holistic thinking and systems seeing into complexity in the first column informs and is informed by compassion and caring in the second. I can see a system more completely if I include not just the objective facts but also the emotions that are present in a situation. I can make sounder judgments (in column three) if I see things more in the round, more completely. And if I know that everything is related to everything else (the recognition of interdependence in column four), then my seeing will be even more complex – and hopefully more comprehensive –

leading to better decisions for action (if deemed necessary), which is what wisdom is about. Thus, a better way of regarding the model as shown in the table is as a spiral. Increasing integration, that is, recognition that the self is part of a much larger whole (a background-foreground shift of the ego with regards the rest of the world) allows for sharper discernment because one can see more clearly as there is less ego and fewer projections in the way. That in turn allows for a broadening of what one considers worth paying attention to. And then that creates a basis for appropriate engagement.

The model as shown in Figure 1 shows that wisdom is all of a whole, is one thing – but with different dimensions that we distinguish for the sake of understanding it better. This conceptualization shows the dynamic quality of wisdom, its continuous flow with each part connecting to the others. However, I do not speak quite accurately here, because wisdom does not have discrete parts that are separate and distinct from each other. When we talk about it and draw models of it, it looks as if it does. Instead, wisdom has variables, some more salient or important at one time than another. That's because wisdom is alive; it moves.

Figure 1. Emergent Wisdom Model © 2005 Caroline Bassett

Discernment is the dimension where one is detached and sees as objectively as possible what is going on, not according to what one would like the truth to be, but what is "really" there, as best one can tell. A caveat here: When I say, "to see as objectively as possible," I can run into a deconstructionist attitude, where we never know what is real or true because our own perspectives and assumptions color what we see, no matter how hard we try not to let them – or no matter how hard we deny them. I certainly can recognize and agree with this deconstructionist claim about objectivity. However, as I am talking about practical wisdom that real people can use, I need to speak a language that most will understand. Hence, I maintain my assertion that we can look at a situation *as objectively as possible*. To help people do this, myself included, I suggest this exercise: whenever a situation arises and you think you understand it, think this in the next second: *This is a story that I am telling myself*. This is how I see the situation. Other people may well see it quite differently. Here is an example from a friend of mine: "I was standing in a street in Fort Bragg, California, headed to my car, when, all of a sudden, I heard a child screaming bloody murder, 'No!! No!! No!!' I turned around and looked, and here was a little boy, at most 4 or 5, trying to escape from a woman who was dragging him toward a truck parked near my car. What did I think? Two immediate thoughts – was he being kidnapped, likely by a 'non-custodial parent'? Was this a truly terrible parent? What to do? Well, within a minute, along came another woman, likely the grandmother. Child is still shrieking and kicking. The new arrival says to me, 'Oh, my – he's having a meltdown. He's autistic.' That thought had not occurred to me at all. I'd only seen an autistic child 'in motion' once before; it wasn't a possibility in my frame of reference" (Thorpe, 2009).

Returning to the model, *Respect* must be added, because, as a State Supreme Court Justice that I interviewed said, "You have to care. You have to care about people. You can't just see clearly what's going on – you have to care." This, then, is the dimension where we give due regard for the right of others to be. Here we find heart, compassion, generosity of spirit. We also find another heart quality, gratitude, which represents a deep spiritual connection to the whole world and a sense of appreciation for all that is.

This dimension can manifest as what Wilber calls an expanded sphere of consideration or a more world-centric perspective (Wilber, 2006). As my heart grows larger, I consider the well-being of more and more people – not just my family or my relatives or my kind, but also increasing spheres that include people not like me and even the creatures of the earth. I can do this partly by taking the perspective or point of view of other people – what does the situation look like from their side of the street? Thus, I will have achieved a more complete view of the situation – and I will, perhaps, have stepped aside from my own subjectivity and assumptions – so that I can act in ways that enhance our common humanity.

Yet, seeing clearly and caring is not enough either. You have to act, which does not necessarily mean running for public office. It can mean writing letters to the editor or talking to others about what you see and know. Finally, the *Integration* dimension brings us inside ourselves – it is the center of our self and of our values. Its chief descriptor is recognition that the self is part of a much larger whole. A main proficiency is "Integrity," which means that your outside (your behaviors) and your inside (your professed beliefs) match up pretty well. I say "pretty well" because no one is totally consistent.

In this dimension, we must know ourselves *and* we must accept ourselves. These are sometimes, alas, quite different. Further, this is where we can transform and grow in cognitive complexity, where we can move into higher stages of development (Walsh, 2011). As we become more objective in our perceptions, as we also expand our sphere of consideration, as we make good decisions, we can become more and more able to see beyond our own narrow self-interest and transcend our projections, moving beyond "individualistic concerns to more collective or universal ones" (Orwoll & Perlmutter, 1990, p. 162). We can become wiser because we have done the work on ourselves and gained a certain amount of cognitive maturity.

This is all fine and good – and pretty abstract. Can we pin wisdom down a bit? Can wisdom, no matter the definition, be measured? Is this something that is possible to do? Some of the researchers discussed above have developed their own measures of wisdom, which are presented in the next section.

Seeing Wisdom through the Lens of Measures of Wisdom

A recent article by psychologists Glück, König, Naschenweng, Redzanowski, Dorner, Strasser, and Wiedemann (2013) provides an excellent overview of four measures of wisdom. Recognizing that interest in the study of wisdom is growing both inside and outside of psychology, the authors state that the concept of wisdom is being applied in a number of fields besides psychology and psychotherapy, such as leadership (Kilburg, 2012) and education (Sternberg, 2010), to which I add my own work (Bassett, 2011a). Which measure to use for which field of endeavor may be the question.

These authors present two ways of grouping measures of wisdom. In the first group we find self-report measures (Ardelt's Three-Dimensional Wisdom Scale (3D-WS), 2003; Webster's Self-Assessed Wisdom Scale (SAWS), 2003; and Levenson and colleagues' Adult Self-Transcendence Inventory (ASTI), 2005). In the second group are performance-based measures (the Berlin Wisdom Paradigm, (Baltes and Staudinger), 2000). In the self-reporting scales, individuals respond as they believe that they behave. In the other, participants give responses to wisdom-requiring problems.

Altogether, these scales measure both distinct and overlapping dimensions of wisdom, depending upon the author's definition of wisdom. It is interesting to take a look at these dimensions from four of the measures, which I am deriving from Glück and colleagues' (2013, p. 4) article. From Webster's SAWS we find *openness* to alternate views and explanations, *emotional regulation* ("an exquisite sensitivity to the gross distinctions, subtle nuances, and complex blends of the full range of human affect" (Webster, 2007, p. 166)), *humor*, *critical life experience* (life experiences that are ambiguous and have unknown outcomes), and *reminiscence and reflection* (reflecting on past and present experiences to help deal with future difficulties).

Ardelt in her 3D-WS includes three major components of wisdom: a reflective dimension that is necessary to the development of the other two, which are cognitive (competence to think deeply) and affective (compassion for others' difficulties). Unlike the others, the ASTI scale, which focuses on self-transcendence (and might be of interest to those with a background in integral studies) is partly based upon European and Asian wisdom literatures, from which four general principles of wisdom derive: self-knowledge, detachment, integration, and self-transcendence. In what sounds like Buddhist language to me, self-knowledge refers to knowing the sources of one's sense of self; detachment directs our attention to the transience of things; integration means accepting all parts of one's self; and self-transcendence means "independence from external self-definitions and the dissolution of rigid boundaries between the self and others" (Glück et al, 2013, p. 5).

As another way of typing wisdom measures, the authors (Glück et al, 2013) distinguish between *personal wisdom* and *general wisdom*. Personal wisdom derives from personal experiences and insights from a person's own life; general wisdom is concerned with human life in general and is not necessarily related to personal wisdom. As examples, I would assume that in the first group we would find wise grandmothers, in the latter, people who have gained knowledge about life in general from reading. To me, however, I cannot think of an example of a person who has gained general wisdom third-hand without at least some engagement in the world. Abraham Lincoln, I would assert, had general wisdom in his insistence that the union hold, but where that knowledge came from, besides both personal observation and interactions as well as, perhaps reading, I do not know. The authors also add what they call *other-related wisdom* which can be translated as compassion, or as they put it, "empathy-based concern for both concrete other people and humankind at large" (Glück et al, p. 5). As compassion matures, it becomes what Wilber calls expanding realms of consideration (2006).

Regarding the relationship to age, the authors (Glück et al, 2013) found that wisdom does not generally increase with age (Glück and Bluck, 2011). However, most researchers expect that most demonstrations of wisdom will not come until people are generally in their 60's.

In summary, the authors (Glück et al, 2013) conclude that different kinds of instruments measure different aspects of wisdom. A person might choose one for one kind of activity or research purpose, another for a different one. All of these studies come from the social sciences. A different kind of research is also being done on wisdom and the brain.

Seeing Wisdom through the Lens of Neuroscience

Because of the overlap in assumptions with regards to what wisdom is and how it differs from intelligence and spirituality, a group of neuroscientists, psychiatrists, and wisdom researchers designed an expert consensus, two-phase Delphi study to do just that (Jeste, D. V., Ardelt, M., Blazer, D., Kraemer, H. C., Vaillant, G., & Meeks, T. W. (2010).

The authors contacted 57 international wisdom experts (of whom this writer was one) with a Delphi instrument. Phase 2 resulted in significant agreement on nine of the 12 main characteristics of wisdom. The authors say,

> …wisdom is a uniquely human but rare personal quality, which can be learned and measured, and increases with age through advanced cognitive and emotional development that is experience driven. At the same time, wisdom is not expected to increase by taking medication. (2010, p. 678)

The consensus found a slight overlap between wisdom and intelligence, with most, if not all researchers, agreeing that a basic level of intelligence is necessary. But, more than intelligence itself, the critical element of wisdom is the desire for learning and in-depth knowledge. Does this concept fit with the three types of wisdom that Glück and colleagues (2013) in the section above distinguish among (personal, general, and other-related wisdom)? It seems to me that it would fit with personal wisdom because an individual needs some level of intelligence, whether educated or even literate or not) and perhaps with general wisdom relates to human life in general. Again, it seems to me that illiterate shamans who are considered wise might have to have some knowledge of human life in general through their observations of life and human interactions around them.

As for the connection between wisdom and spirituality (the former often subsumed under the other in New Age thinking and in those sections of a bookstore), the authors (Jeste et. al, 2010) found that the two share pro-social attitudes such as compassion and other-centeredness. But, religion and religious practices are unrelated to wisdom, which suggests that wisdom does not require religious faith. At the same time, it seems that the respondents did not separate out religion from a broader sense of spirituality. The experts did agree that resilience and successful coping strategies were significantly more important components of wisdom than either intelligence or spirituality.

In a study of the neurobiology of wisdom, psychiatrists Meeks & Jeste (2009) used six of the sub-components of wisdom that researchers had identified: "pro-social attitudes / behaviors, … social decision-making/pragmatic knowledge of life, … emotional homeostasis, … reflection / self-understanding, … value relativism/tolerance, … and acknowledgment of and dealing with uncertainty/ambiguity" (p. 356). The authors focused on the possible anatomical locations of these components in the brain determined through neuroimaging (p. 357) which showed how specific brain regions may interact to contribute to the performance of these subcomponents of wisdom. They summarized their findings by noting the "interplay and balance between older brain regions (e.g., limbic cortex) and the more recently evolved PRC (prefrontal cortex) in the putative neurobiology of wisdom" (p. 362). Also, they found that several characteristics associated with wisdom, such as the use of knowledge for the common good and the integration of affect and knowledge, show up in different parts of the brain from those used for intelligence and reasoning.

Having looked at analytical approaches to the study of wisdom, including different definitions of wisdom and measures of it as well as what brain scientists have to say about the subject, we wonder what other lenses can tell us. What would a focus on integral theory and post-conventional development show us about wisdom?

Wisdom through the Lens of Integral Theory

I cannot begin to synthesize the complexity of integral theory except to point out some of its most salient and useful features and refer people to Roger Walsh's (2011) excellent article that explains it far better than I can. Most useful, perhaps, is the domains of reality (the four quadrants) and concepts of levels and lines of development. In *Integral Spirituality* Wilber (2006) presents the clearest and most complete discussion of his theories.

In the idea of the four quadrants – the interior I and We and the exterior It and Its, each on an individual and a collective level – yields a 2x2 table (see Walsh, 2011, p. 112). Walsh says that "understanding any phenomenon adequately requires investigating all of its four quadrants, and using methods appropriate to each quadrant" (p. 112). Further, he suggests that wisdom can be found in all four quadrants: in individuals as insight, in collectives in the cultural ethos (the interior half), and in the exterior side, in social constructions that embody individual and collective wisdom, such as legal and educational systems as well as contemplative institutions.

In terms of development, many psychologists describe people as maturing from pre-conventional to conventional to post-conventional levels. (See the following section on post-formal thought for a discussion on this topic.) In terms of integral theory, Wilber postulates post-post-conventional levels or transpersonal ones, as Walsh (2011) calls them.

Another useful concept is the one of developmental lines. It seems to me patently obvious that these exist – one has only to look around to see people who are extremely intelligent but morally stunted, who are exceptionally mature but seem not to have an esthetic bone in their bodies, and so on. (This reminds me of Howard Gardner's work on multiple intelligences where people present with different abilities. Intelligence can no longer be considered as logical-mathematical and verbal aptitudes only. Other intelligences include kinesthetic, spatial, and musical, for example (Gardner, 1993/2004)). Wilber (2006) suggests many lines: cognitive, moral, emotional, interpersonal, self-identity, esthetic, psychosexual, spiritual, and values (pp. 23-24). Perhaps there is also a wisdom line of development. To explore this idea further, in the next section we will continue our examination of a related aspect of integral studies, that is, post-conventional development.

Wisdom through the Lens of Post-Conventional Development

Like the phrase "post-modern," "post-conventional" or "post-formal" tells us what it comes after, but not what it itself is. Perhaps it means exceptional maturity or uncommonly well-developed cognitive complexity or perspicacious post-formal thinking (or logic). Indeed, there is no common language to express a qualitative difference in thinking about self and world. Nevertheless, I want to take a little time to discuss the movement from conventional to post-conventional thought because it can provide insights into where we can find wisdom, how we can develop it, and how we can get into trouble with it, too. "What passes for morality or spirituality in the vast majority of people's lives is the way everybody they grew up with thinks." So says Father Richard Rohr who writes about spirituality in the two halves of life and how we can deepen our experience in the second (2011, p. 83). His statement exemplifies the conventional level of development mentioned in the section above. And, don't forget Emily Dickinson who tells us that the majority prevails and if you are deemed different, watch out!

But why is it important to turn our attention to the movement to post-conventional thinking? Why does it matter? It does matter. It matters because newly emergent capacities such as making decisions undistorted (relatively speaking) by personal agendas, suspending what is already known, and being open to new ways of seeing and understanding things, can lead to more accurate meaning-making. Or, as educator Jack Mezirow (1990) puts it,

> perspective transformation is the process of becoming critically aware of how and why our presuppositions have come to constrain the way we perceive, understand, and feel about the world; of reformulating these assumptions to permit a more inclusive, discriminating, permeable, and integrative perspective; and of making decisions or otherwise acting upon these new understandings. *More inclusive, discriminating, permeable, and integrative perspectives are superior perspectives* that adults choose if they can because they are motivated to better understand the meaning of their experience. (p. 14. italics in original)

Or, we can look to Kegan's (1994) orders of consciousness to help us comprehend the differences in the thought processes. The top three orders are of interest to us. In the third, which is congruent with conventional levels of development, people think what they *should* think. They believe that what they *should* feel is what they *do* feel and what they *should* value is what they *do* value. You can see that here, as Emily Dickinson says, the majority prevails. The predominant way of understanding the world and one's place in it does not just guide our thinking – it determines it. In the fourth order, however, a person becomes what Kegan calls self-authoring. That is, she determines for herself what she thinks, feels, values, even if it conflicts with or subverts prevalent ideas and standards. This is a self-determining level. She knows her own mind independent of cultural expectations or assumed truths. She sets limits and maintains boundaries, thus gaining her own sense of authority or voice. While someone at the third order could be torn apart by competing roles or expectations from external persons – for example, how to be a good worker and a good parent – at the fourth order a person has more options. This person will have a larger perspective from which to make sense of expectations, thus allowing her to independently figure out for herself what will work in this situation or context.

Here is an example. One day when I was teaching a class on Kegan's work, a student suddenly sprang up from his chair. "I get it!" he shouted. "I get it!" Then he explained to us what he meant. He worked at the post office. A recent order had been received from management for people to organize and work in teams, which he and his co-workers did, discovering that this was a good way to get their work done and even experiment with innovations. But their supervisor kept on finding fault with their work and giving them a hard time. Nothing they did was right, despite the fact that they were following top management's orders. What the student suddenly understood what that he and his co-workers were pursuing their tasks in a more independent way than they had been – in short, in a fourth order way. But the supervisor was a third order man for whom independent actions smacked of insubordination and disobedience. He was used to things working in a certain "right" way and felt insecure and challenged when those who reported to him acted in more self-determining ways.

In the fifth order, at which few people arrive, individuals begin to see how their own personal system (that, in the fourth order, has become independent of externally imposed societal expectations and assumptions through critical reflection of what works and what doesn't) is mediated by historical, cultural, psychological, and other forces. In the fourth order, you are the system that you have created. But in the fifth, a person comes to a realization of the constructed nature of his or her meaning-making system. She understands that who she is, is simply one system among many. This means that rampant individualism, which is a downside of fourth order consciousness ("this works for me, and I am going to do it this way"), becomes tempered by understanding that I, like you, am part of larger systems. There is a foreground/background shift (like Kohlberg's (1981) seventh stage). "I am not very important after all." It is a humbling stance.

What does all of this have to do with wisdom? Is someone at the fourth order wiser than someone at the third? Or is fifth order thinking better than fourth? I cannot but think that in some ways this is the case, especially if we look back at Mezirow's words on more inclusive, permeable, and integrating perspectives as being superior because they lead to more accurate meaning-making. Or, in terms of wisdom, perhaps, this perspective offers more accurate ways of seeing – of discerning, respecting and caring, acting fairly, and integrating various elements of self with the rest of the world, deepening the ability to see beyond the self, to deal with the paradoxes that life presents, and to recognize more and more deeply the interdependence of all things. But, do we really know if such recognition makes a substantive, permanent difference?

So far, we have been looking through various lenses mostly at one end of the spectrum, the analytical side, except for some examples from the arts. Let us now turn to looking at wisdom in action, in real people's lives. This is the subject of the next section.

Seeing Wisdom through the Lens of Everyday Life

We fret a lot these days about the apparent surfeit of information, coming at us from all directions. Information can be a good thing – it can be helpful to us, amusing and entertaining; it can make us more effective in our jobs. But it can distract us, fracturing our concentration. Too much information is un-wisdom because wisdom is about knowing what is important and what to do about it. Wisdom can help us to discern what information is important and what, if anything, to do about it. Wisdom is about taking the time to reflect, sort, distinguish, triage, hierarchize. What is important in this situation? How can I tell? What should I do? What's right? These are the questions to ask, which an unimpeded flow of information can continually interrupt until we find ourselves flattened under a heap of data and ideas, some conflicting, all demanding to be paid attention to. Wisdom requires a different kind of mindset – unless a more modern brain than mine can sort and prioritize and make decisions in a different way than mine does – and given technology and how it seems to be changing brains, this may yet be possible.

Yang (2008) offers us a way that might help us handle this information overflow. She argued that wisdom is a real-life process. This means that in an everyday difficult situation a person makes an unusual integration, embodies his or her ideas through action, and brings forth good results. Thus, the steps are the sorting and prioritizing of what is important, arriving at an integration of ideas that could work in a problematic situation, acting upon this integration, and achieving positive effects. She says, "People may accomplish all kinds of good work, but unless the consequences of their actions bettered their own lives and those of others, their actions cannot be deemed as being related to wisdom" (p. 73). This view and that of most other wisdom researchers in one form or another, including mine, reflects the philosophy called pragmatism where the focus lies not in a description of "reality" or of the concept of reality but rather what is useful, what succeeds, what works. If wisdom isn't practical and useful, what do you want it for? How does anyone know you have some wisdom if you don't use it?

Besides other examples that I have given, such as my student (and Evelyn in the next section), here is one from ordinary life. Note that I say "wisdom" or perhaps it should read "wise behavior." In South Sudan a group of American doctors intentionally brought warring factions together. As a condition of free cataract surgery the ophthalmologists insisted that people from rival ethnic groups sit together and talk. One patient said, "I always thought in many ways that the Dinka were devils and had horns, but they're just like us" (Straziuso, 2014, p. A7).

So far, we have looked at wisdom through a number of lenses. Now I will turn to show you what I see through my own.

Seeing Wisdom through My Own Lens: What I've Learned about Wisdom

I have read the literature. I have interviewed people deemed wise by others. I have been a keen observer of both events and environments, and I have settled upon the following four essential propositions about wisdom**.**

Here are the four propositions:

1. Wisdom is complex, just like the world we live in. It is not one thing but rather results from the interaction of an indefinite number of elements (because we cannot identify all of them, though I believe that I have a handle of some of them in the model).
2. Wisdom is useful to us in our daily lives. It is available to all of us.
3. Wisdom lies on a continuum; it is not as rare as we think.
4. We can enhance our own wisdom and encourage it in others.

Wisdom is Complex

This is the first proposition, and I have explained the relationships and interactions of the various elements of wisdom above in the Emergent Wisdom Model. They include Discernment, Respect, Engagement, and Integration. Note that the model is neither static nor linear; rather it is dynamic and builds on constant interaction of all the elements.

Is it possible that wisdom is, after all, simple because oftentimes we recognize it when we see it? It is true that we recognize it when we see it because we see it as a whole, not as a collection of parts. However, it is also complex because to produce it you need the interaction of an indefinite number of variables. That blend forms a pattern, so that when we see it in action, we see it as wisdom. For example, I could give you a list of parts and most likely you would not know what they were for: "*drafthood, reducer ring, baffle assembly, heat trap, cold water dip tube, anode rod, temperature and pressure relief valve, drain valve, thermostat, manifold, orifice, main burner, pilot assembly, pilot tube, thermocouple, screw 10-32 x .312 PH RD MACH, pilot shield, inner door, outer door, palnut, air shutter.*

"Here is a picture of the *relationships* among these items assembled into a whole:

However, if I had told you that they represented all the parts of a water heater, you would immediately recognize it as such" (Thorpe, 2009). Thus, wisdom may look simple but is complex in the integration of all of the relationships that comprise it. We need to remember, looking back at the wisdom model, that embracing paradox is part of wisdom.

Wisdom is useful to us in our daily lives; it is available to all of us

The second proposition states that wisdom is useful to us in our daily lives. Wisdom lies in the stratosphere, but it also in the air around us all the time, if we can recognize it in its more humble aspects.

Just because a decision is not changing the course of human history or forwarding a movement as Martin Luther King, Jr.'s, did, does not mean that wisdom is not occurring. Here is a simple example that one could claim is "just" common sense. Perhaps it is common sense. At the same time, it does what wisdom does: it focuses on what is important and what to do about it. It demonstrates sufficient awareness of a number of the aspects of wisdom and uses them in a way that makes the situation better for all involved.

Evelyn, a student in a class of mine, told us about a predicament that she had been in until she figured out a solution that worked for everyone, even if her daughter was not entirely happy with it. Evelyn had recently retired from a busy job as an attorney in a law firm and was enjoying her freedom for the first time in her adult life. She took short or long trips; she joined two book clubs; she took up photography with regular classes from a master photographer. So, when her daughter, who had just given birth to twins, wanted Evelyn to spend nights at her house to care for the babies, Evelyn was understandably reluctant. At the same time, she felt an obligation to help her daughter out, and she wanted to too. How could she do both?

In class she had learned about stepping outside of herself and looking at the whole picture, from a third person point of view. Here was a mother of just-born twins who needed help and wanted it from her own mother. Here was a woman of just-gained freedom in retirement who wanted to enjoy life. In this situation, what actions would satisfy both parties?

Evelyn realized that she could not give up all of her freedom, nor could she ignore her daughter's needs. So she decided to spend two nights a week at the twins' home and then give her daughter some money to hire someone for other nights. Was the daughter altogether happy because it would be “just for a few months”? No. But her mother stood firm with her decision. Six months later Evelyn told me that it had all worked out just fine.

Here is another example. One day in the summer of 2010 at a baseball game (Detroit Tigers-Cleveland Indians), a pitcher was throwing a perfect no-hitter, but at the bottom of the ninth inning, the umpire called the batter safe at first base, when replays showed that, in fact, the batter was out. Did the pitcher stomp over to the umpire, yell in his face, throw his glove on the ground, swear, and turn red with fury? No. Instead, the umpire, Jim Joyce, personally apologized to the pitcher Armando Galarraga saying that he was wrong (Kepner, 2010). Further, in a number of interviews, Joyce publicly acknowledged his mistake. Galarraga said that he told the umpire, “Nobody’s perfect.” What a way to defuse a situation.

In both stories, the people involved ended up feeling better about the situation at the end than at the beginning. They show us examples of relatively wise behavior on a small, often personal, scale. These are examples of little wisdoms, rather than big wisdom. Little wisdoms and big wisdom both involve complex, dynamic elements. (Recall the concept that wisdom is a fractal, a scale-independent self-similarity. That is, no matter the size or scale – scale independence – wisdom looks the same – self-similarity. All of the parts are replicated, though on different scales.) What makes the wisdoms different – and are they? Next, we’ll look at the continuum of wisdom.

Wisdom lies on a continuum; it is not as rare as we think

Most researchers believe that wisdom is rare, that along with being the “pinnacle or hallmark of adult thinking” (Merriam, Caffarella, & Baumgartner, 2007, p. 351), it is not achieved very often. The neuroscientists that I cited above in the section on neuroscience (Jeste, Ardelt, Blazer, Kraemer, Vaillant, & Meeks, 2010) believe, paradoxically, that wisdom is both a rare quality and one that is distributed across the population. When they speak of wisdom, they are seeing it as a trait that manifests at the far end of what I am calling the wisdom continuum. That is, for me, wisdom is not an either-or, you-have-it-or-you-don’t, you-are-wise-or-you-are-not-wise proposition. Rather, it is something that lies on a continuum. If we look only at the far end of the continuum, then all we find is that rare wisdom that lies several standard deviations from the mean. Does this mean that there is no wisdom other than that at the extreme? What about the little wisdoms I mentioned above? For this reason, I believe that we can understand wisdom better if we see it on this continuum.

Actually, a better image is three continua. The first is a continuum of wise people; the second is on the impact of a person’s wisdom; and the third has to do with the nature of the wise decision itself. The first continuum extends from you and me to people like Nelson Mandela who united a whole country that could easily have been torn apart by racial violence after apartheid ended.

Within this continuum it is likely, as Bluck and Glück suggest, that wisdom will manifest differently in different phases of life and that the “full use of one’s wisdom appears to be a developmental achievement” (2004, p. 569). How is it that some people have more wisdom than others? Some individuals simply come into the world with a greater propensity for wisdom than others do, just as some people are naturally gifted as tennis players or sculptors or mathematicians. The wise ones would grow in cognitive and emotional complexity as they mature, increasing in wisdom as they move through life, just as we can on a smaller scale.

The second, and closely related, is the continuum of the impact of the person's wisdom, in which Nelson Mandela's would have far greater repercussions than anything I would ever do. Those we look to as wise are usually leaders or major public figures, such as Abraham Lincoln and Nelson Mandela – and this is one way that we know about them and their wisdom. For the less visible among us, our wisdom is little known. In classes that I teach or talks that I give, I ask the participants to identify a wise person that they know personally. Many name a grandfather or aunt or friend of the family, someone with no public sway at all. When pressed, the participants give examples of activities that correspond with the definition of wisdom on a small personal level with little if any public impact.

The third continuum is about the nature of the wise decision in and of itself, some decisions requiring more insight and depth of understanding of patterns and relationships (the Discernment dimension of the Emergent Wisdom Model) as well as more toleration for paradox and ambiguity (the Integration dimension) than others do. For example, Abraham Lincoln's decision to go to war with the seceding South in order to keep together the union of the people, by the people, and for the people – this first-time experiment in governance that the world had ever seen – certainly was a more difficult and nuanced one than Evelyn's on how to balance her needs with her daughter's.

What about the rest of us without a strong inborn propensity for wisdom? Is there any way that we can increase our own wisdom intentionally, or is it a matter of luck? In the next section, I discuss some ways that we can develop our wisdom.

We can enhance our own wisdom and encourage it in others

The fourth proposition asserts that we can intentionally enhance our own wisdom and encourage it in others. The latter first: an easy way to do this is to point out to your friend, neighbor, or colleague when he or she is acting wisely. Comment on it. Acknowledge it. This way, two things happen. First, the person realizes that she has done something wise and, because of this realization, may be more likely to do so again in the future. Second, the very fact of publicly acknowledging something as wise brings it more to our awareness and thus we may notice it around us more.

As for the former, enhancing our own wisdom, I have recently written several chapters that include a number of strategies for doing just this (Bassett, 2006; Bassett. 2011a; Bassett, 2011b). Here I will discuss three.

First, there is the technique of looking at yourself in the third person. Tell a story about yourself with you as one character among many, perhaps not the main one. Tell the story from the point of view of another character, and see what happens. Insights may arise as you probe other psyches and points of view.

Second, refer to the Emergent Wisdom Model and at the bottom in the section called "Queries," you will see a number of questions to ask yourself when you are in a difficult situation that requires wisdom to get out of. These queries should become second nature to you and ring in your mind like a beloved melody. Ask yourself what is really going on, not what you would like. There can be a big difference. Ask yourself how someone else would view the same situation. Ask yourself what you want to accomplish with a decision and how it will affect not only yourself, but also others. Who might these others be? What might happen? Finally, ask yourself if your decisions are bettering not only yourself but also the lives of others.

Third, and an assignment that I give students or workshop participants for life, is what I call Wisdom Watch. It means looking for wisdom around you, in the street, on the job, on television or in movies, anywhere. Wisdom is out there and the more we acknowledge it, the more we will recognize it in the future.

Wisdom Emerges; It Does Not Conclude

We have looked at wisdom through various lenses, including definitions of wisdom, different measures of wisdom, neuroscience, integral theory, post-conventional development, everyday life, my own lens, and we have looked directly at it, in the lives of people. We will all continue to look for – and at – real wisdom in real lives. Here is one more look, at a man who practiced wisdom all his life and who sang of it, using the words of Ecclesiastes 3:1-8 – Pete Seeger:

> To everything (Turn, Turn, Turn)
> There is a season (Turn, Turn, Turn)
> And a time for every purpose, under Heaven.
>
> A time to be born, a time to die
> A time to plant, a time to reap
> A time to kill, a time to heal
> A time to laugh, a time to weep
> …
> A time to build up, a time to break down
> A time to dance, a time to mourn
> A time to cast away stones, a time to gather stones together.
> …
> A time of love, a time of hate
> A time of war, a time of peace
> A time you may embrace, a time to refrain from embracing
>
> To everything (Turn, Turn, Turn)
> There is a season (Turn, Turn, Turn)
> And a time for every purpose, under Heaven.

Anyone who speaks (or sings) these words knows a thing or two about wisdom – that it is not one thing and that it contains contradictions and paradox, that it contains multitudes. At the same time, knowing every purpose is just one part of wisdom. The other is knowing when it is time to build up and, when the time comes to break down, *how* to do it. This is the other part of wisdom – having sufficient awareness to know not only the *what* of a thing but also the *when* and the *how*. It is a lifelong practice, a never-ending song.

Wise Ways of Seeing:
Wisdom and Perspectives

Roger Walsh[1]

Abstract: The capacity for perspective taking is thought to be linked to psychological development and to wisdom. This article draws from psychological, contemplative, cross-cultural, and philosophical disciplines to create an inventory of perspectival skills and their possible relationships to wisdom. The nature of perspectives is explored, as are the characteristics of healthy perspectives, and the factors—such as developmental stage, assumptions, and state of mind—that determine the number and kinds of available perspectives. The article then examines rare postconventional perspectival capacities such as the ability to integrate multiple perspectives, to adopt higher order metaperspectives, and to experience transperspectival "pure awareness." Fifteen kinds of wise perspectives and perspectival skills are suggested. Finally, the article reviews psychological, relational, contemplative, philosophical, and educational methods thought to foster perspectival skills and wisdom.

Keywords: Assumption, development, perspective, perspectivism, transformational learning, wisdom.

Introduction

> *Wise individuals are aware of the fact that there are multiple perspectives on every phenomenon and they are interested in learning from new perspectives and from other people*. (Glück & Bluck, 2014, p. 75)

Wisdom is many things. Yet it certainly includes one thing: the capacity to see in new, beneficial, and benevolent ways. What kinds of ways? Well, at least twelve ways that can be clustered into four groups. In general, wise ways of seeing will tend to be:

1. Nonconventional.
    - Novel: new, fresh, and often unexpected.

---

[1] **Roger Walsh MD., Ph.D. DHL** graduated from Queensland University with degrees in psychology, physiology, neuroscience and medicine, before coming to the United States as a Fulbright scholar. There he passed licensing exams in medicine, psychology and psychiatry, and he is currently professor of psychiatry, philosophy and anthropology, and a professor of religious studies at the University of California at Irvine. His research and writings have received over twenty national and international awards and honors while his teaching has received one national and seven university awards. His publications include *Paths Beyond Ego*, *The World of Shamanism*, and *Essential Spirituality: The Seven Central Practices*, and he recently edited *The World's Great Wisdom.* He was formerly a circus acrobat and has recently been trying to learn standup comedy, with little success. SOME RIGHTS RESERVED

- Insightful: productive of new insights and understandings.
- Unconventional: beyond conventional assumptions, out of the box.
- Postconventional: expressing exceptionally mature levels of development beyond the conventional.

2. Wise people will likely use and integrate multiple perspectives.
   - Multiple perspectives: Able to look at things from multiple angles or points of view. Not limited to one perspective, but employing multiple perspectives.
   - Flexible and agile: able to move easily and quickly between multiple perspectives
   - Metaperspectival: able to adopt higher order perspectives.
   - Integrative: able to not only adopt multiple perspectives, but also to recognize relationships between these perspectives, and integrate them into a higher order synthesis.
   - Big picture: able to encompass large complex systems or communities, to encompass long time spans, and consider multiple factors. Also able to adopt both big picture and close up perspectives, to zoom in and zoom out.

3. Wise people will tend to recognize the limits of perspectives.
   - All perception depends on perspective (perspectivism.)
   - Any (single) perspective is partial and limited.

4. Beneficial: Wise people will recognize ways of seeing that are helpful to both themselves and others.

A Central Hypothesis

The central hypothesis of this article is this: *Wisdom is a function of the capacity for taking skillful perspectives.* Of course, wisdom is also much more than this capacity but will certainly include this capacity.

I define a perspective or action as *skillful* to the extent that it minimizes suffering and enhances wellbeing for everyone involved, including oneself. So the hypothesis that wisdom is a function of the capacity for taking skillful perspectives implies that wisdom involves the capacity for looking at things in ways that lead to reduced suffering and enhanced wellbeing.

What evidence is there for a relationship between wisdom and skillful perspective taking? As yet, there is little, but growing, research on either wisdom or perspectives, so experimental research on their relationship is very limited. However, there is evidence that perspectival skills are related to psychological development, and there are suggestions that these skills are related to wisdom. For example:

- A close relationship between psychological development and perspective taking skills has been demonstrated in studies of child and adolescent development (e.g., Lapsley, 2006). Likewise, integral theorists often posit a close relationship between adult development and perspective taking skills, although there is little actual evidence for this relationship (Fuhs, 2013; Martin, Sobel, and Elfers, 2008).

- Multiple fields that recognize the need for greater individual and collective wisdom in order to solve our social and global problems, also emphasize the need for broader integrative perspectives (Esbjörn-Hargens & Zimmerman, 2009).
- Researchers often suggest that wisdom is associated with maturation to postconventional stages and to greater integrative perspectival capacities (e.g., Kramer, 2003). For an analysis of the possible relationship between wisdom and development see Walsh (2011, 2012)
- The most prolific wisdom researchers, the Berlin School, emphasize two criteria of wisdom that seem closely related to perspectival skills. The first, *life span contextualism*, "considers the many themes and contexts of life and in addition, incorporates a lifetime temporal perspective" (Baltes & Staudinger, 2000, p. 125-6). The second factor, "*relativism of values and life priorities"* recognizes the relativity of what is appropriate for different people and situations.
- Monika Ardelt's Three-Dimensional Wisdom Scale (3D-WS) measures reflective skills which she defines as "a perception of phenomena and events from multiple perspectives" (Ardelt, 2004, p. 275).

The Relationship between Wisdom and Perspectives: Key Questions

These ideas lead to four key questions:

1. What is a perspective?
2. What factors determine the number and types of perspectives available to an individual (and society)?
3. What are the characteristics of skillful perspectives?
4. How do we foster the capacity for skillful perspective taking?

These may be crucial questions for wisdom studies and also for integral theory (Cook-Greuter, 2010; Fuhs, 2010; Wilber, 2013). Unfortunately, there is little research on adult perspective taking and skills. Consequently what follows are largely hypotheses. These hypotheses are based on my reading in related literatures, clinical observations of psychologically disturbed patients, personal observations of psychologically mature and wise people; the practice and teaching of psychotherapy, meditation, and other contemplative disciplines; and considerable reflection on these issues. All the ideas in this article are presented, not as beliefs to be accepted, but as hypotheses to be tested. If they foster thinking and research about wisdom, perspectival skills, and their interrelationships, they will have served their functions well.

What is a Perspective?

The term perspective is used in psychological literature in several ways. Interpersonally or socially, it implies the capacity to see things from another's point of view. Generically, it refers to points of view in general.

In this article I will mainly be using the term generically. In this generic sense, we need to consider two types of perspectives: physical/spatial and psychological/cognitive.

- A physical/spatial perspective is determined by the spatial location of the viewing point relative to the physical object observed.
- Within mental space, a psychological perspective is determined by the viewing location or vantage point with regard to a mental object.

I presume that psychological perspectives are largely determined by operative schemas and modes.

Schemas are mental models: conceptual networks and frameworks that serve to identify, categorize, frame, and interpret specific types of stimuli. As such, they determine the meaning and significance of stimuli, and the responses to them.

For example, Neo-Kohlbergian researchers see moral development as maturing, not from one stage to another, but from one schema to another. Each successive schema enacts an increasingly encompassing and nuanced metaperspective, worldview, and morality (Thoma, 2006).

"Modes are networks of cognitive, affective, motivational, and behavioral schemas" (Beck & Weishaar, 2014, p. 232). The schemas of a mode operate together to interpret stimuli, and then create emotional, motivational, and behavioral responses to these interpretations of them. Modes are presumably related to states of mind or states of consciousness (Tart, 2001) and to the ego states described by transactional analysis (Berne, 1964), ego state therapy (Watkins and Watkins, 1997), and by Genpo Roshi's Big Mind process.

It is important to note that we respond, not to objects themselves, but to our interpretations of them. This is an ancient idea, and some 2,000 years ago the Stoic philosopher Epictetus (1899) warned that "Men are disturbed not by things, but the view which they take of them." Or as Shakespeare put it, "There is nothing either good or bad, but thinking makes it so" (Hamlet, II, 2).

A perspective is a selective perceptual stance which results when awareness is filtered through and constrained by mental schemas and modes. A perspective therefore functions as a perceptual and interpretive framework which biases and limits perception (as well as subsequent interpretation, understanding, and responses). For example, when anxiety schemas are operating, these schemas produce cognitive and perceptual biases that view experiences largely in terms of their threat potential. The anxiety modes then generate corresponding anxiety based emotional, motivational, and behavioral responses to threat. Very importantly, perspectives tend to be self-fulfilling. That is, we tend to find what we look for.

What Factors Determine Available Perspectives?

One important question is: What are the factors which determine the number and kinds of available perspectives? Three of the most important factors may be:

1. A person's developmental stage,
2. Their state of mind, and
3. Their assumptions or presuppositions.

Because the number and types of available perspectives are so important to perspectival skills and wisdom, let's examine these three determining factors more closely.

Development

> *We have seen in the description of peoples' development from one stage to another that each new stage brings a qualitative expansion in perspective taking.* (James Fowler, 2000, p. 85)

A person's developmental stage may determine and limit the number, scope, and levels of available perspectives. This is a central tenet of a child and adolescent developmental psychology, and of integral theory. "From cognitive to interpersonal and affective to self-sense, development in many domains progresses in accordance with an individual's ability to take perspectives" (Fuhs, 2010, p. 273). For example, in childhood, when the capacity for taking other peoples' perspectives comes on line, this new capacity allows a shift from egocentricity to mutuality and ethnocentricity.

In adulthood, these capacities can expand further. For example, one's perspective can expand from identifying with, and thus being concerned for one's community (ethnocentrism—"my country right or wrong") to a perspective identified with, and thus concerned for, all people and all life (worldcentric). Temporally, one's perspective can expand from one's own short term benefits to a concern for the needs of future generations. This perspectival expansion is related to "the expanding circle" of care which is a central feature of ethical maturity (Singer, 2011), and has long been a central goal of Confucianism. "Learning to be human" for Confucians "is to learn to be sensitive to an ever-expanding network of relationships" (Wei-Ming, 1985, p. 175).

Postconventional developmental levels of perspective taking

Postconventional levels of development appear to offer four major advances in perspectival capacities:

1. An increase in the number of available perspectives,
2. Increased integration of perspectives
3. Adoption of metaperspectives
4. Breakthroughs into transperspectival pure awareness

1. Number of Available Perspectives

From childhood on, psychological development is often associated with a growing capacity to take a greater number of perspectives. This growth is thought to continue into and through postconventional, post-formal operational stages.

2. Integration of Perspectives

Development is associated, not only with a growing number of perspectives, but also with a growing ability to integrate these perspectives (Fuhs, 2010; Kramer, 2003). Likewise, some theorists such as Jean Gebser and Ken Wilber suggest that cultural evolution also involves a growing number and integrative capacity of perspectives. For Gebser, cultural evolution culminates in the "integral aperspectival mind" which is able to integrate multiple individual perspectives, evaluate their perceptions as a whole, and therefore hold no individual perspective as final (Feuerstein, 1987; Wilber, 1995).

Ken Wilber suggests that recognition of multiple perspectives can outpace the growth of integrative capacity. The result is two distinct early post-conventional stages.

The first stage is recognition of the multiplicity of possible perspectives. This results in pluralism but can also lead to relativism—a stance that there are no grounds for privileging one perspective over others. At its extreme, Wilber (2000) suggests this can devolve into "aperspectival madness" in which no perspectives or values are seen as better as or worse than any others (p. 170).

For Wilber (2006), relativism and aperspectival madness occur at the pluralistic-relativistic (green) stage of cognitive development which is the first post-formal operational stage (p. 68). This aperspectival madness underlies the excesses of deconstructive postmodernism and may also play a role, I would suggest, in existentialism's groundlessness and the angst that it generates.

At the next developmental levels of low and high vision logic (Wilber's teal and turquoise which correspond to Kegan's Fifth Order consciousness), integrative capacities mature further. This allows not only a recognition of multiple perspectives, but also a meaningful integration and comparison of them.

Stages beyond these are rarely described. However, the Indian philosopher-sage Aurobindo (1970) mapped several rare postconventional stages beginning with what he called the Higher Mind, which Wilber (2000) categorizes as a form of vision-logic. According to Aurobindo (1970), the higher mind:

> can freely express itself in single ideas but its most characteristic movement is a mass ideation, a system of totality of truth, seeing at a single view; the relations of idea with idea, of truth with truth are not established by logic but pre-exist and emerge already self-seen in the integral whole…. In the end there is a great totality of truth known and experienced but still a totality capable of infinite enlargement because there is no end to the aspects…. This is the Higher Mind. (pg. 940, 941)

3. Capacity to Adopt Metaperspectives

A third postconventional perspectival capacity is the growing ability to consciously adopt metaperspectives. This is a process where one disidentifies or disembeds from a previous perspective and adopts a new perspective that is transcendent or *meta* to the previous one. One can then look back at the previous perspective, and thereby examine, assess, and relativize it.

As an example, consider people who mature from conventional to postconventional morality: from what neoKohlbergians call the conventional “maintaining norms” schema to the postconventional schema. At the maintaining norms level, people unreflectively accept conventional social norms, morals, and laws, and strive to maintain them. These norms are unquestioned assumptions through which, and from which, conventional people view the world. “For this schema, no further rationale for defining morality is necessary beyond simply asserting that an act is prescribed by the law, is the established way of doing things, or is the established will of God” (Thoma, 2006, p. 79).

However, when people mature to the postconventional schema, then they are able to look at, rather than only look from, the conventional moral assumptions, and are therefore able to evaluate them. That is, they can now adopt a metaperspective relative to the conventional cultural perspectives. They have moved from a first order to a second order (meta) perspective. The capacity for adopting metaperspectives is one aspect of metacognition which is the capacity for knowing, and sometimes regulating, one’s cognitive processes.

Now suppose that some of these people learn about developmental research. Using this research, they then look at their new moral perspective and the developmental jump they made. Now they may see “Oh, I was locked in a conventional schema and perspective, but then I matured to a postconventional perspective. However, that postconventional perspective is itself just one way of looking at moral issues.” These people have now moved to a third order or meta-metaperspective.

Perhaps a few of these individuals will even move to a still higher order perspective in which they recognize that all living creatures develop and all phenomena continuously change. Now they may recognize their own moral maturation as only one kind of development and as one expression of a universal law of change as described, for example, by Heraclitus, Whitehead, and the Buddha. These people have now moved to a fourth order or meta-meta-metaperspective from which they can view, situate, and interpret their earlier perspectives. Note that the adoption of higher order metaperspectives may not necessarily require or lead to higher order developmental stages (Fuhs, 2013).

The growth of metaperspectival skills may confer multiple benefits. First, each higher order perspective seems to provide a wider vision and a bigger picture. But it may also provide greater depth, a greater appreciation of complexity and interdependence, more psychological flexibility and freedom, and more opportunities for choice.

4. Transperspectival Awareness

There is a fourth, final, and radically different postconventional (or better, transconventional) perspectival potential. This is the ability to disidentify from all mental phenomena, processes, and perspectives, and to rest in pure awareness as the equanimous witness of all phenomena, processes, and perspectives. This is a transconceptual, transpersonal, and transperspectival state which allows transconceptual intuitive apprehension and insight. The result is a *transconceptual wisdom* that is highly valued across multiple traditions as, for example, Hinduism's *jnana*, Buddhism's *prajna*, Christianity's *gnosis*, and Islam's *ma'rifa* (Walsh, 2012, 2014).

States of Mind

Less complex than development, yet still a major determinant of the number of available perspectives is a person's state of mind. The terms "state of consciousness" and "state of mind" are sometimes used synonymously. However, "state of consciousness" is less accurate since what changes is not pure consciousness—which is unqualifiable, transtemporal, and unchangeable—but rather mental contents and processes (Rock and Krippner, 2007).

Specific modes or states of mind are associated with specific dominant perspectives that determine one's way of looking at oneself and the world. For example, anxiety states result in fear of, and hypervigilance for, threats. Paranoid states view the self as special and under attack, while depression channels perception and interpretation of both oneself and the world in negative pessimistic ways. Conversely, healthy and higher states of mind are probably associated with more positive, healthy perspectives, with access to larger numbers of perspectives, and with a greater flexibility and fluidity in moving between them.

Assumptions

Assumptions constitute the third major factor determining the number and kinds of perspectives available to a person. Assumptions are beliefs or presuppositions that are accepted as true. Assumptions often operate unconsciously to produce specific biases of both perception (looking at things in specific biased ways) and cognition (processing information in specific biased ways).

When assumptions are unskillful they produce, not just biases, but also specific cognitive and perceptual vulnerabilities which can result in significant psychopathology. For example, a depressed person's perceptual bias and vulnerability is to look for the worst interpretations of themselves and life. This bias is rooted in three destructive assumptions which together constitute the so-called "cognitive triad of depression." This triad consists of the beliefs that "I'm bad" (resulting in unworthiness), "life is overwhelming" (resulting in overwhelm and despair), and "it's always going to be that way (resulting in hopelessness) (Beck & Weishaar, 2014).

Assumptions tend to operate as self-fulfilling prophecies both personally and interpersonally. What we assume to be true tends to become true. As Henry Ford said "whether you think you can or think you can't – you're right."

A similar principle operates interpersonally. Our positive assumptions about other people tend to elicit improved performance, a phenomenon known as *the Pygmalion* effect (Rosenthal & Jacobson, 1992). Conversely, negative assumptions about people tend to impair their performance (the *Golem effect*). These effects may play a role in class and racial performance differences, and they also operate in conflicts where, in worst case scenarios, "Enemies finally become what they imagined each other to be" (Frank, 1982, p. 146), a tragic result that is played out in war after war.

In short, assumptions mold perspectives, perceptions, and behavior, and create worldviews (Hedlund-deWitt, 2013). Consequently, recognizing assumptions—a process which might be called *preduction* (Wilber, 2011), and may be as important as deduction and induction—is vitally important. Recognizing assumptions, assessing their value and validity, and modifying them as appropriate is essential for fostering skillful perspectives, as well as for psychological wellbeing and wisdom.

What are Wise Perspectives and Perspectival Skills?

We have already foreshadowed these wise perspectives and skills in the article's opening section. There I suggested that wisdom includes the capacity to see in a variety of novel and beneficial ways. We can now describe these ways more precisely in perspectival terms. Specifically, I suggest that wisdom may be associated with at least fifteen beneficial perspectives and perspectival skills:

1. Novel perspectives: A wise person may be able to look at things in new, fresh ways that are unexpected and surprising.

2. Unconventional perspectives: Wise people will be able to disidentify from and grow free of conventional assumptions and perspectives. This will allow them to adopt unconventional perspectives and to think outside the box.

3. Postconventional perspectives: Wise people may adopt, not only unconventional perspectives, but also more developmentally mature postconventional (or even transconventional) perspectives. It is not only that wise people see things in new ways, but that these new ways may be unconventional, postconventional, and transconventional.

However, so far there is little research on relationships of wisdom to developmental stages. In fact, a study of ego development using the Washington University Sentence Completion Test found that the scores of wisdom nominees averaged only slightly above the highest conventional (Achiever) stage (Krafcik, 2011).

4. Insightful: novel perspectives will allow the recognition of novel insights, understanding, and solutions.

5. Perspectivism: A wise understanding of perspectives will recognize perspectivism and the limited and limiting nature of perception and perspectives. All perceptions reflect perspectives, and all perspectives are limited and limiting in that they are partial and selective in what they reveal. This is a venerable idea which was strongly argued by Nietzsche as perspectivism, and has long been a central tenet of Jainism.

In Jainism, the term *syādvāda* implies that all perspectives or viewpoints are conditioned, while the term *nayavāda* implies that they are partial. These ideas are integrated into the "one of the most important and fundamental doctrines of Jainism," *anekāntavāda*, which holds that there are always diverse viewpoints on any phenomenon. *Anekāntavāda* acknowledges that some viewpoints are more valid than others while simultaneously recognizing "that no single point of view is the complete truth" (Wikipedia). *Anekāntavāda* encourages tolerance, pluralism, and the search for common elements and integrations. These important Jain ideas may be insights which wise people of diverse cultures intuit to some degree. Perspectivism and *anekāntavāda* would presumably help in "seeing through illusion" which is one (limited) definition of wisdom (McKee & Barber, 1999).

Half a continent away, perspectivism found another early champion in one of the earliest and greatest of Taoist sages, Zhuangzi (also known as Chung Tzu, c. 369-286 BCE). Zhuangzi lived during a time of violent political conflict which was mirrored by vehement philosophical debates between philosophical schools, especially the Confucian and Mohists, each sure that they alone possessed the truth. Zhuangzi was not so sure.

In fact, he was not so sure of anything, because he saw that all perspectives and arguments derive from perspectives, and that "each perspective is trapped in its own standpoint" (Lai, 2006, p. 370). In short, Zhuangzi recognized perspectivism some 2,200 years before Nietzsche. Zhuangzi was a master of stories and parables and made his point with the following story:

> You can't tell a frog at the bottom of the well about the sea because he is stuck in his little space. You can't tell a summer insect about ice because it is confined by its season. You can't tell a scholar of distorted views about the Way because he is bound by his doctrine…. (Mair, 1994, p. 153)

Zhuangzi and many Taoists distinguish between small knowledge (xiaozhi) and great knowledge (*dazhi.*). Whereas small knowledge asserts and argues, "Great Knowledge, by contrast transcends assertions of truth. Its wisdom lies in knowing the limits of small knowledge" (Lai, 2006, p. 373).

For Zhuangzi, wisdom requires the realization of perspectivism, and his philosophy aims "not to search for truth but to question its limits" (Lai, 2006, p. 371). Rather, "wisdom consists in *understanding* that individual perspectives are limited….For Zhuangzi wisdom lies in the realization that one's individual insights and grand theories—however sweeping and inclusive they may seem—are ultimately perspectival" (Lai, 2006, p. 373, 371). This realization allows us to hold perspectives lightly.

When perspectivism goes unrecognized problems ensue. For example, to the extent that any perception is not recognized as perspectival—and therefore as partial, selective, and relative—it will tend to produce a corresponding experience, worldview, and self-sense that will be assumed to be accurate and correct. As such, this perception will likely:

- Go unquestioned
- Result in self-deception and delusion
- Reinforce one's current belief system and worldview
- Foster dogmatism

- Serve a defensive “legitimizing” function (Wilber, 2005), i.e., defend and preserve the current self-sense and developmental level, rather than fostering further development
- Create suffering. Once one appreciates the power of perspective, one also recognizes just how many of our individual, social, and global problems are caused by the failure to recognize perspectivism (Walsh, 2009).

The challenge for all of us, and something that wise people may do exceptionally well and often, is therefore to continuously attempt to:

- Recognize unhelpful, partial perspectives, in both ourselves and others.
- Release and integrate these limited, harmful perspectives into more encompassing (contextually wider and developmentally deeper) metaperspectives.

Of course, recognizing, releasing, and growing beyond our current perspectives is not always easy. Yet it is rewarding, and Sri Aurobindo’s biographer gave a beautiful account of perspectival maturation as follows:

> And yet we only knew how each loss of one’s viewpoint is a progress and how life changes when one passes from the stage of the closed truth to the stage of the open truth—a truth like life itself, too great to be trapped by points of view, because it embraces every point of view…a truth great enough to deny itself and pass endlessly into a higher truth. (Satprem, 1968, p. 84)

6. Multiperspectival: When people are locked into a single perspective they suffer from the pathology of *perspectival fixation*, and the painful results include close-mindedness, rigidity and dogmatism. In contrast, wise people will probably recognize and adopt multiple perspectives. Their multiperspectivalism, prospectival fluidity, and greater perspectival range will presumably be associated with qualities of greater open-mindedness and tolerance of ambiguity, and both these qualities have been found to correlate with wisdom scores (Baltes & Staudinger, 2000; Helson & Srivastava, 2002).

7. *Perspectival fluidity* is the ability to move easily and quickly between perspectives. This ability is probably related to the Buddhist psychology (*abhidharma*) qualities of mental pliancy and agility which are healthy qualities that are fostered by contemplative practices (Nyanaponika Thera, 1998).

8. Coordinating perspectives: Once people have grown beyond perspectival fixation and are able to fluidly move between perspectives, then they are likely to begin coordinating them. “Coordinating perspectives refers to the simultaneous consideration of two or more perspectives…” (Martin, Sohol, & Elfers, 2008, p. 294).

9. Metaperspectival capacities: Wise people may be able to adopt higher order metaperspectives. By being able to disidentify from earlier perspectives, and to then look back at, and evaluate them from a higher metaperspective, wise people will be better able to more accurately assess and integrate lower order perspectives.

10. Integration of multiple perspectives: A further developmental skill beyond simply recognizing, comparing, and coordinating perspectives is integrating them. With their capacity for adopting metaperspectives, wise people will be better able to recognize relationships between, and forge integrations of, individual points of view, including ones that previously seemed unrelated, incompatible, or conflictual.

Metaperspectives and perspectival integration have been recognized for millennia, and used to produce profound contemplative practices and philosophical syntheses. For example, Hua Yan Buddhism recognizes several perspectival levels described as the *dharmadatus* or worlds revealed by successively deeper perspectives on and insight into reality. Very simply, the first *dharmadatu* is our ordinary perceptual world of form, while the second is the meditative recognition that all phenomena are *sunyata* or empty. The third *dharmadatu* is the recognition of "nonobstruction," meaning that form and emptiness are not conflictual or even different. As the Heart Sutra, which is chanted daily in most Zen monasteries, says "Form is emptiness, emptiness is form."

With the aid of these recognitions, Hua Yan philosophy and practice aim at recognizing and integrating multiple perspectivism. "The goal seems to be a type of perspectival flexibility, which corrects the obsessive—compulsive tendency to identify with a single perspective by acknowledging the multiplicity of perspectives available and by adopting higher-order perspectives that reconcile the inconsistencies present between lower order perspectives" (Fox, 2006, p. 738).

11. Big picture perspectives: The ability to recognize, adopt, and integrate multiple perspectives may allow wise people to recognize big pictures. They may be better able to see and think systemically and metasystemically, and to recognize and work with greater complexity (Commons & Richards, 2003).

These big pictures may be big both spatially and temporarily. That is, they may have both greater spatial scope and time span. This is one reason why wisdom may correlate with greater awareness of, and care for, larger communities such as all humankind and all life (a worldcentric perspective), as well as larger time frames such as a concern for future generations.

This principle is expressed exquisitely in the Native American emphasis on considering the welfare of "the seventh generation." "One of the first mandates given us as Chiefs" wrote a Native American leader is to, "make every decision that we make relate to the welfare and wellbeing of the seventh generation to come….where are you taking them? What will they have?" (Lyons, 1994, p. 173).

12. Big picture and fine detail: When a capacity for seeing big pictures is merged with perspectival fluidity and perspectival integration, it yields the ability to zoom in and out. This is the ability to move fluidly between close up, fine detail perspectives and big picture metaperspectives, and to then integrate them.

Zoom skills have long been recognized as valuable by ancient philosophers such as Plato and the Stoics, by contemplative practitioners, and now by business leaders.

> Some people prefer to see things up close, others from afar. Both perspectives—worm's eye and bird's eye—have virtues and pathologies. But they should be vantage points, not fixed positions. Leaders need multiple perspectives to get a complete picture. Effective leaders zoom in and zoom…. A failure to zoom can spell doom. As we have seen, problems arise when people get stuck at one end of the scale and are unable to move to the other for a different perspective. (Kanter, 2013, p. 99, 103)

Tibetan Buddhism recommends "a view as vast as the sky, but an analysis as fine as barley flour" (Surya Das, 2012). Clearly, zoom skills have been valued for thousands of years.

13. Beneficial perspectives: Since benevolence is a core characteristic of wisdom (Jeste, Ardelt, Blazer et al, 2010; Walsh, 2014a), wise people will seek perspectives and consequent actions to enhance the wellbeing of everyone, including themselves. To focus only on themselves would be selfishness; to focus only on others would be sacrifice. Wisdom seeks a balance and win-win situation (Sternberg, 1998). This specific ability—indeed, all these perspectival abilities—will likely tend to make wise people exceptionally benevolent, helpful, effective, and skillful.

14. Reframing is the conscious choice of an alternate perspective. This shift—which is also known as cognitive reappraisal or reattribution—can sometimes produce remarkably rapid benefits, and is a central therapeutic technique in cognitive therapy and neurolinguistic programming. Several studies suggest that wise people are able to reframe challenging life events so as to eventually see them as valuable learning opportunities (Glück & Bluck, 2014, p. 90).

15. Metaframing is the conscious choice of a metaperspective. Metareframing offers the benefits of reframing plus the ability to look back, assess, and situate previous perspectives from a higher order perspective.

The Farther Reaches of Perspectival Maturity: Is there a Final Perspective?

So where does perspectival maturity culminate? There are three answers.

One answer is in a fluid openness to all perspectives: a capacity for adopting any and all perspectives that are helpful for experiencing, understanding, and responding to life. This is a way of seeing and being that is no longer limited to any one view but rather is open to all views. It is an ability to appreciate the boundless perspectival possibilities of life, and yet to spontaneously select those appropriate to the moment. We might call it panpersectival or omniperspectival. The American teacher Almaas (2014) describes this beautifully:

> The view of totality is an understanding that allows and holds multiple views at once: the ego view, the essential view, the boundless view, the view of one or another realization, the Christian view, the Buddhist view, the view of nonduality, the dual view, the view of being an individual, the view of not being an individual, and infinite other views…So this view is totally open and open-ended. The importance of such a view is that when we fully understand the view of totality, we don't need to stick to any one particular view. We can

> acknowledge and include many different views and, at the same time, the perspective of totality gives us the freedom to take any one view at any particular time without having to adhere to that view as our ideology or as the final word on reality. (p. 92)

This understanding recognizes that there is no final experience or way of looking at it. As the quotation by Satprem described, there are always more possibilities, more perspectives, and more metaperspectives, and the result is, as Almaas (2014) subtitled his book, “a life of ceaseless discovery.”

A closely related potential is a higher order integration of perspectives. Almaas pointed to this. So did Aurobindo (1970) who claimed that in the higher reaches of postconventional development, the Higher Mind may be able to recognize and integrate all relevant perspectives, “seeing at a single view” and “capable of infinite enlargement” (p. 940).

And finally, all perspectives may dissolve into transperspectival awareness. From this awareness, perspectives can then be allowed to reemerge, beneficial perspectives can be selected, with their partial selective nature recognized, and their transperspectival, transpersonal ground remembered.

Fostering Perspectival Capacities and Wisdom

Can these perspectival capacities be fostered—and with them, wisdom—and if so how? Again there is very little research. However, two families of approaches may be helpful: general and specific practices.

General practices enhance overall psychological health and maturity, and thus facilitate multiple capacities, presumably including sapiential and perspectival capacities. These practices include a wide array of lifestyle, psychotherapeutic, and contemplative disciplines (for reviews see Walsh, 1999, 2011; Yalom, 2003). Specific practices or disciplines aim at fostering specific skills, in this case perspectival skills.

Specific Practices for Cultivating Perspectival Skills

At least seven kinds of specific practices may be helpful.

1. Learning about perspectives and perspectival skills. Learning about potentials, such as perspectival skills, as well as their benefits and the possibility of developing them, may inspire some people to begin doing so.

2. Social contact with, modeling by, and transmission from wise people who are perspectivally skillful. This is a specific example of the social learning theory principle that many skills are learned by observation and imitation of skilled exemplars.

3. Instruction: Active instruction in perspectival skills — such as recognizing, assessing, and consciously choosing perspectives—is a common element of coaching and psychotherapy.

It is especially common in cognitive therapy and neurolinguistic programming which emphasize reframing (Beck & Weishaar, 2014).

4. Reflective dialogue aimed at mutual learning, growth, and emancipation is a venerable and powerful technique. Varieties that have flourished for millennia include Socratic dialogue, Tibetan Buddhist debate, as well as Jewish Torah study where “one works in a dyad called a *chavruta*. The two partners learn together, challenging one another lovingly, sharpening one another, working toward truthful understanding…” (Boettiger, 2014, p. 18).

Dialogue can unveil the limitations of individual assumptions, such as those that fuel psychopathology, as well as of collective assumptions, such as those that support cultural hegemony, inequality, and injustice. Reflective dialogue is therefore a central element of several therapies, educational systems, and social movements. These include group psychotherapy, “consciousness raising circles” such as those of the women’s movement, “transformative learning” for adult education, and Paolo Freire’s “culture circles” aimed at cultural and social emancipation of the poor. Considerable research evidence supports the effectiveness of such groups and dialogue (Merriam, Caffarella, & Baumgartner, 2006; Mezirow, 1990; Yalom & Leczsz, 2005).

5. Novel experiences: Exposure to novel experiences has long been known to offer mental stimulation and foster creativity. Historically, regions of intercultural mixing have been notably creative, and travel was said to broaden the mind. The value of novelty is borne out by research suggesting that transformative learning is enhanced by “putting participants in unfamiliar and new situations, ... maximizing the diversity mix of participants, ... and repeated team opportunities balancing action and reflection” (Lamb, 2003, pp. 266-267). Presumably, novel experiences, ideas, and cultures call unrecognized personal and cultural assumptions into question, and promote the exploration of new perspectives.

6. Education: The proper goal of education is perennially disputed. At one extreme is the technical–economic goal of providing students with the information and skills to find jobs and fuel the economy. Very different is the developmental–cultural goal of fostering questioning and growth for individual and cultural maturation. Both goals are obviously necessary, though it is a perennial struggle to preserve the developmental–cultural goal against economic forces.

Adult education which aims for developmental goals is often called “transformational learning” because it aims, not just to fill learners with facts, but to transform how learners view themselves and their society. It does this in significant part by encouraging students to question their assumptions and broaden their perspectives. A central technique is “critical reflection” to question the validity of assumptions, and then “reformulating the assumptions to permit a more inclusive, discriminating, permeable, and integrative perspective.... *More inclusive, discriminating, permeable, and integrative perspectives are superior perspectives*” (Mezirow, 1990, p.14). Hopefully, this kind of assumptive and perspectival transformation leads to greater maturity and wisdom since “although wisdom cannot be taught in the same way as intellectual knowledge and technical expertise, it can be taught indirectly by helping students to view and experience the world from many different angles...” (Ardelt, Ackenbaum & Oh, 2014, p. 288).

Three transformational learning programs have been especially influential. These are the German *Bildung* tradition of personal and cultural maturation, Paolo Freire’s social emancipatory education, and Jack Mezirow’s transformative learning.

A core goal of transformative learning is recognizing and growing beyond limiting assumptions and perspectives. Learning is thought to occur via four main processes: experience, critical reflection, reflective discourse, and then action to express one’s new perspective (Mezirow, 2000; Taylor & Cranton, 2012). “Probably more than any other approach, this [transformational learning] theory has captured the attention of educators over the last fifteen years” (Merriam, Caffarella, & Baumgartner, 2006, p. 157).

7. Deliberately adopting other people’s perspectives may be beneficial (Bassett, in press). Clint Fuhs (2010) and his colleagues have developed a group exercise “The Meta-Practice” where members practice adopting each other’s perspectives and metaperspectives.

8. Adopting novel spatial or imaginal perspectives is a time honored philosophical and contemplative practice. Many traditions recommend reevaluating one’s life and priorities from a larger perspective, such as the infinity of space or the eternity of time (Hadot, 2002; Walsh, 1999). In *The Republic* (486A), Plato urged us to develop “a mind habituated to…the contemplation of all time and all existence,” a cosmic perspective which disentangles us from mundane obsessions. As the Stoic philosopher Seneca put it picturesquely, such a mind “casting a contemptuous glance at the narrow globe of the earth from above, says to itself: ‘so this is the pin-point which so many nations divide among themselves with fire and sword? How ridiculous are the boundaries of men!’” (cited in Hadot, 1995, pp. 98-99). Metaperspectives can be revealing and freeing.

9. Meditation has long been the cornerstone of advanced contemplative practice and is now the most researched of all contemplative and psychotherapeutic disciplines (Walsh, 2014a, b). It is widely held to foster wisdom, and the famed Rabbi Nachman claimed “One who does not meditate cannot have wisdom” (Buber, 1970, p. 37). As yet, there is no contemporary research on its effects on wisdom or perspectives.

However, certain meditation practices, especially mindfulness and analytic practices, may be helpful, both generally in catalyzing psychological growth, and specifically in enhancing perspectival skills. Mindfulness and analytic practices foster careful observation of experience and disidentification from mental processes, which are both probably central processes in perspectival and metaperspectival skills.

Conclusion

This article offers multiple varieties of evidence and lines of reasoning suggesting that perspectival skills may be central elements of wisdom and essential ways to foster it. As yet there is little research on either wisdom or adult perspectival capacities, and so the suggestions presented here are initial forays into the relationship between these two important skills. These suggestions are hypotheses that will hopefully in time be tested, and thereby enhance both wisdom and perspectival capacities.

Acknowledgements

The author would like to express gratitude for the valuable feedback of Ali Alekin, Caroline Bassett, and Jonathan Reams, and for the secretarial assistance of Bonnie L'Allier. I would also like to recommend an excellent article by Tom Murray (2010) that I discovered just as this paper was going to press. Murray offers an intriguing innovative exploration of related topics that nicely complement this paper.

Editorial to the Special Issue of Integral Review on European Academic Trends and Contributions to Integral Studies

Marc G. Lucas and Matthew Rich-Tolsma

Keywords: Europeanness, integral theory and practice, integration, integrative complexity, knowledge.

The Meaning of and Contribution to Europeanness by Academic Integral Theory and Practice

What does 'integral' mean in the context of the European academy? This special issue of Integral Review aims to address this question through highlighting integral theories, methodologies, and research practices related to the European context. It is important to raise this question in this manner at this time in order to distinguish between the popular usage of integral as an umbrella term for various kinds of worldviews, often with a spiritual connotation and the historical and emergent academic movements towards "integrative approaches" and "grand theories." European thought would differentiate between two dialectical tensions related to these two fields, which could be described as a) (quantitative and analytic) natural science and (qualitative and holistic) humanities/art (Geisteswissenschaften) and b) religious dogma and spiritual experience. Whilst in this sense engaging in both of these fields may have a specific role to play in the unfolding of what "integral" means in the European context, our focus in this special issue concerns deepening understanding of academic integral theory as a process which assumes possibilities of advancing the integration of such knowledge stemming from the natural sciences as well as the humanities, practically, theoretically and meta-theoretically.

In our view the Special Issue is timely as there are some recent developments within European society and the European academic context that make it not only necessary to develop more integrative engagement, but also indicate some "proto-integral" trends. The whole European idea started as a myth of integration of the union of human beauty and wisdom, with the bull the symbolic representation of strength and fertility (Everett-Heath, 2000). And today "Europe is a dynamic plurality of ideas and rhythms which aspire to finding common ground within a framework of diversity" (Prats & Raventos 2005, p. 27). Of course such common ground can never be achieved easily and as a final solution. Deep forms of dialectical thinking therefore have quite understandably emerged within the European context and shaped academic endeavours towards striving for temporary synthesis and complementarity which is always aware of its often dilemmatic and discontinuously changing Gestalt. Such development can for example be seen in recent debates on the migrant crisis, where blame games and disunity stand against a growing understanding of the need to find new and better solutions to such complex crises. In such discourse an underlying European theme can be found which might best be described using Vergara's (2007) statement that Europe is constantly working towards a common identity, which, from the point of view of human diversity (both individual and collective), should have as

SOME RIGHTS RESERVED

> the basis and intangible beginning of the old and yet new European identity mankind and its individual, social and transcendent rights [...] Europeanness is a quality far richer than any unilateral reductionism brought about by modernity. Above all, it is a way of being and acting, which has had, as the non-renounceable basis of its construction and historical identity, mankind and its moral, intellectual and transcendent character. (pp. 15-22)

In the field of academia the 5th Euroacademia Global Conference "Europe Inside-Out: Europe and Europeanness Exposed to Plural Observers" held in Barcelona, Spain in March 2015 might be an example of recent explorations of such Europeanness. It is as well a topic for current organizational research within academia. The authors Meyer and Boxenbaum (2010, p.738, pp. 751-752) regard this research in Europe as being rooted in a long-standing humanistic tradition of a more philosophical and social scientific nature. For them European research is often grounded on the work of grand thinkers. Equally, Europeanness leans towards more macro-oriented, critical, and processual approaches. Receptiveness to alternative paradigmatic perspectives is more accepted within European academic cultures. In this sense current European integrative frameworks like syncretism (Martinez, Peattie & Vazquez-Brust, 2015) advocate the reconciliation of economic imperatives and environmental concerns via the reintegration of corporate objective (or systemic) and subjective (or constructionist) contingencies. Within European thought the struggle of "Widening horizons beyond national boundaries" (Hickson et al., 1980, p. 1) is a constitutive driving force.

The few attempts to define Europeanness in a positive way include terms such as multi-disciplinarity, reflexive methodological stance, critical scholarship, and socio-political orientation. The authors conclude that Europeanness, if the term is applicable yet, reflects a spirit of engaging with grand thinkers of the present and the past in attempts to integrate the different linguistic communities included in the respective research. This linguistic and multi-disciplinary diversity often stimulates European research to reflect on the nature of relationality and integration of disparate findings from a more complementary and/or comprehensive perspective. In such attempts a proto-integral orientation can be seen, in light of which the contributions in this Special Issue can be contextualized.

Nevertheless Europeanness still focusses on a hyper-rationalistic, multi-linguistic but still language bound research orientation in a post-modernist way. This assessment leads to the following exploratory attempts at a journey into an alternative, maybe post-postmodernist research perspective. The articles in this special issue indicate possible ways of how such integral thought could contribute to the current state and defiances of European academia. In these recent developments of sense- and meaning-making structures, integral thought quite naturally participates by being grounded in the current European life-condition and concomitant historical cultural tradition.

In this sense the special issue is highly relevant to today's changing European Gestalt and can contribute to the emergence of its more integrated shape which might be more adaptive to the pressing complex issues at hand.

The Content of this Special Issue

Shaping a structure for the content of an issue of Integral Review is not a trivial task to undertake. In the best sense of the term "border-worker" (Horlick-Jones & Sime, 2004), all the contributors in this issue share an intellectual work that all too often stems from the respective author's condition of living on the borders of the academy and civil society while engaging in their work in addressing a rich diversity of complex problems. Accordingly, submissions from European researchers presently working in the academy are brought together with such contributions from primarily independent scholars.

While in this sense being aware that the contributions of each author have theoretical as well as practical relevance, the issue is nevertheless separated into two sections. While section one Integral Theorizing in European Academia, includes papers that are dealing with issues that are more focused on theoretical and methodological reasoning, section two, Integral Practice and Applications in European Academia, covers contributions that are dealing with and focus on integral practice and/or applications.

In section one several authors have inquired into which modalities of knowing can be identified as legitimately scientific from an integral academic perspective as outlined above. This suggests the importance of engaging in research on philosophy of science, sociology of knowledge, and economics. The authors have critically dealt with a wide range of integrative approaches and streams of thought especially including those of European origin in service of this inquiry. But these papers not only deal with topics related to deepening our understanding of what "integral" might mean in a European context. Rather they also approached the topic using integrative methods, mixed methodological inquiry, the scholarship of integration, and transdisciplinarity.

Lucas' art-inspired and phenomenological inquiry delves into an integrative investigation of developmental trends bringing together first, second and third person multi-method approaches. Self and long-term societal transformations are being merged and united in a visionary process-form of a Moebius strip. The dialectics of art and science foster such a movement. The whole process is being reflected within the philosophy of complexity, adult developmental theory and recent scientific findings especially from neuro-psycho-economics.

Hagström and Stålne enter such an arena via a more adult developmental perspective. In their article especially the generality claims of some of these theories are being reflected upon. Such claims are usually interpreted as being opposed to each other in every general model of adult development and therefore are usually seen as incommensurable. Seemingly they contradict existing domain specificity claims as well. In interrelating Kegan's Subject-Object-Theory with Common's Model of Hierarchical Complexity within a thought experiment, the authors explore dialectical reasoning to come to a more complex re-solution to a long-term debate within adult developmental psychology. Again, subjectivistic and objectivistic scientific positions are being pacified and postindustrial societal relevance of such complex reasoning is being discussed.

Laske explores the social dimension of collaboration e.g. within profit organizations via his dialectical thought form. Such self-awareness fosters late adult cognitive development post formal reasoning by integrating e.g. Bhaskar's dialectical theorizing with social-emotional components. Adult developmental approaches are being incorporated in a grand theory approach discussed here.

Fein closes the more theoretical articles included in section one by showing how such integral thought – as explored in the three articles before – relates to recent trends within organizational studies. By comparing the so-called Practice Turn to its forerunners within classical modernity of science from a more integral perspective, she appreciates the emergent qualities of such post-modern practice oriented theorizing and as well indicates a surplus which could be given when a more integral perspective would be taken. Again complexity, inter-relationality, cross-field multi-perspectivity and multi-method inquiry as well as the developmental perspective are being demonstrated as a genuine integral contribution within European integral thought.

In section II, other responses in this Special Issue highlight and inform how such integral approaches are relevant for addressing a multitude of ecological, economic, societal and individual-related issues in Europe. These papers give an impression of what impact integral practice and applications can have. For this they are describing examples of practice and applications of integral thought in such diverse fields as organization and management studies, collaborative learning in educational programs, nation building, and climate change engagement. One of the aims of this special issue is to showcase European academic talent and projects in such endeavours, that combine individual with collective (large-scale) as well as inner and outer perspectives on such pressing topics.

In this sense Küpers, Deeg and Edwards use the inter-relational metaphor of a bridge for their phenomenological investigation into "syn-integrality" within organization studies and practice. Dialectical and integrative orientations are being explored in their relevance for a new approach to organizing. Lucas' more phenomenological-visionary, Hagström's and Stalne's more developmental and Laske's more dialectical lenses are applied to Fein's organizational topic.

Aschermann and Klenzan give an insight into recent research in the field of pedagogics. A constructivist perspective and as they say trans-disciplinary approach is combined with their Cologne model which is built upon a four quadrant heuristic widely utilized in integral theory. In their discussion – as in Laske's article - again collaboration, self-awareness and learning stand in the center of the practical considerations. Their aim is to give a fresh perspective and some practical advice for teacher training to foster such collaborative learning.

Wagner gives some insight into a large-scale application of classical integral models within nation-building processes. Through the Yalla program – initiated and supported by the German Federal Foreign Ministry – he was one of the leading designers in shaping intercultural management trainings in which young leaders from the Middle East and from Germany were brought together under human developmental and value systems perspective. The Spiral Dynamics model was used as a lens for the training and development research undertaken.

Hampson and Rich-Tolsma offer some perspectives on the relevance of transformative learning for engaging climate change, by suggesting the necessity of developing a complex integrative, or reconstructive postmodern, worldview in order to address this wickedly complex problem. The article is an opinion piece exploring this transformation of worldview in terms of regenerating practices, perspectives, and principles. The authors draw particular attention to the critical contrast between atomism as an attractor for modernism, and complex integration as an attractor for an ecological worldview, and attempt to valorize transformative learning as one apt approach for facilitating this critical engagement.

All in all the papers in section two give some insight into the wide range of relevant, complex and pressing challenges integral approaches engage with from a European perspective. Together with the articles from section one a rich selection of European academic thought and practice is presented in this special issue, which outlines the different aspects of Europeanness discussed at the beginning of this editorial.

Re-viewing Self and Societal Development from a Postformal Perspective: An Artistic De-concealiation, Reconciliation and Trans-formation

Marc G. Lucas[1]

Abstract: The aim of this paper is to attempt to do justice to the chosen topic, including regarding its design. In a conscious distinction from the more conventional, materialistic, rationalistic, and quantitative approaches that prevail today in the economic and social sciences, the focus of this study will first be placed on consideration of images, contextualising the way in which I perceive them (first person perspective). Thus the paper is structured along sequential instances of experience and concomitant reflection bringing together such different paradigmatic positions as artistic and scientific approaches to individual and collective developments within an integrated approach that includes and transcends conventional thought. Together with statements from several artists and their works of visual arts (second person perspective) and in a mutual exchange with third person approaches from current psychological, economic, and neuro-scientific debates this will create an integrated systemic image, which in particular allows a deeper look into the underlying overall developmental theme. Every section of the article will be introduced by two correspondent statements, one written from an artistic more introspective perspective and one from a philosophical or scientific position to point out the main tension experienced and discussed within the section. Main aim is to allow to arise cross-fertilization in the sense of a hermeneutic circle. This circle finds its dynamically-sustaining shape in the form of a Mobius strip. Philosophical contributions in particular from phenomenology and complexity theory complete the picture, thus creating a conscious draft, which is aware of its own subjectivity. Ultimately the simultaneous inclusion of artistic and creative skills carried out in this article, goes beyond individual paradigms of a formal logic inherent in existing theories of development toward a more inclusive and visionary logic of the art looked at/and artistic lens seen through.

The numerous paintings and other visual art referred to in this paper cannot be included in the text due to existing image copyright. However they are clearly identified by the mention of each title so that they can be retraced using popular search engines on the Internet. I hope that readers interested in a deeper understanding can gain their own pleasure and inspiration from this paper when (re)searching the paintings as well.

---

[1] **Marc Lucas** is professor of media-, economic and business psychology at University for Media, Communication and Economics (HMKW) in Cologne, Germany as well as founder of Lucoco Lucas Consulting & Counseling. His main interests are in the integration of such diverse fields as adult development, neuro-leadership, organizational trauma prevention, crisis-management, and arts-inspired qualitative research as well as meta-theorizing.

The Experience of Being Lead into (intro ducere) Intro-spection and Ex-(s)pectation - in Frankfurt's Schirn Kunsthalle, 2011

> *Words of science and all other attempts at description are ways of concealing phenomena rather than elucidating them*. (Merleau-Ponty, 1969, p. 21)
>
> corresponds to
>
> *The artist has the most important task to fulfil in our society, since all other fields are apparently a failure. That is why the artist must ensure and contribute to the world's renewal. Humanity needs to be shown a new way*. (Hundertwasser, 1982 taken from Hirsch, 2011, p. 173)

After a demanding day of consultancy discussing the issue of crisis prevention with a company in the tourism industry I, shortly before closing time, “took my-self” off to a special exhibition displaying works by the French painter Gustave Courbet. My gaze was captivated by a self-portrait. The artist Courbet stands considering what is probably one of his artworks, although you cannot see it. With wide eyes, his hands tearing at his hair, you see him as "The Desperate Man" (1844/45). What makes him so desperate are internal thought processes which are not directly revealed to the viewer. So is there really nothing to see? The painter Mark Rothko said *“There is no such thing as a good painting about nothing”* (Johnson, 1982, p. 14). After some time I read a statement by Brough (2012) which relates to the experience previously made:

> *Paintings that matter are about something that matters. But precisely because the painting itself, as an image, has the peculiar nature of being “nothing” that it can be about something. Images enrich our experience by folding into themselves the world and our relation to it, our feelings and our beliefs, offering them to our contemplation and bringing their truth before us, moving and delighting us. Though images may be nothing real, nothing embraces reality better*. (p. 562)

From a neuro-scientific perspective, according to Kahneman (2011), what happens at the original art encounter creates a priming effect on the viewer. The viewer's thoughts are steered in a certain direction, associating their current perception with appropriate thoughts. Even on an emotional level, processes are set in motion, which are correlated in terms of neuro-scientific findings with the firing of mirror neurons (Rizzolatti & Sinigaglia, 2007). At the exhibition out of the chaos and turmoil that the contemplation of such an image and the uncertainty about the underlying content of what is being viewed elicit, memories of other paintings and engravings, which at their time elicited similar turmoil, are evoked. The internal picture collection is quickly reduced to a few examples which are historical precedents to the picture currently being viewed. Courbet's gaze can be compared to the frightening gaze of a chimera in Fuseli's "The Nightmare" (first version from 1781). A pale (and possibly wise) woman is depicted on a bed, helplessly exposed to this ghostly creature and an ape-like (animalistically prehuman) demon. In Goya's

1797 painting, "The Sleep of Reason Produces Monsters", a central figure has also fallen asleep and is surrounded by creatures of the night. What looks like bats in the shadows turns out on closer inspection to be an owl, a bird of wisdom. For the viewer this is a sign of a dialectically charged relationship in the suspense of a whole era between the early progressive forerunners of the French Revolution and their decline into post-revolutionary restoration. The synthetically removed dialectic is symbolically surrounded by reason, associated with light (the Enlightenment, siècle des lumieres), and emotions banned to the darkness, hence the shadows. That the "Nightmare" was exhibited in exactly the same year in which Kant (1781) defined "ratio" as a universal instance of judgement in his "Critique of Pure Reason" seems, bearing this in mind, to be more by design than by accident. From today's perspective, one could agree with neuro-philosopher Metzinger (2009, p.17) that *"many deep forms of conscious self-experience have become all but impossible due to philosophical enlightenment and the rise of science and technology."* From earlier social-philosophical contributions, in particular from the Frankfurt School, we are also aware of one of these tensions and contradictions of early modern critiques of a simple glorification of the Enlightenment. Horkheimer and Adorno (1944) took such considerations as a basis for their seminal work "Dialektik der Aufklärung" (Dialectic of Enlightenment). And as is so often the case, there are notable artistic contributions, and those borrowed from art, which prematurely anticipate such ideas from creative material. For example, Hugo (1827) expressed *"even the mortal part of [dualistically imagined] people, the counterpart of reason, the naturalistic, the bodily, whose displacement is increasingly proven by the proponents of Enlightenment to be an illusion, should come into its own right in art."* And Hegel (1979), the forefather and father figure of dialectic, wrote in his lectures on the history of philosophy from 1819 *"The great presumption that reason is received in the world on this side is then nothing more than a belief in providence, simply by other means."*

Where science often comes along as a desolater of basic assumptions and does so apparently without prejudice, is seemingly the point at which art, in turn, can better shed light on historical relationships and inter- and disruptions in the central motifs of an era. It can do this precisely, because it was banished to the shadows by the science since the age of Enlightenment. Precisely insomuch as the mainly representational function of art ended at the time of the French Revolution, almost exclusively due to a lack of customers placing commissions, artists had to find a new way to conduct business and define themselves. However, it was exactly this conjuncture that made their situation difficult and frequently even prevented them working. Eisner (2008) reveals the following picture of an era of upheaval.

> *Science's belief in reason became the driving force of that age. From then on art and its possible contributions were banned from the conscious(ness) approaches of enlightenment. Part of the reason for the separation of the arts from matters epistemological pertains to the belief, a true one I would argue, that the arts are largely forms that generate emotion.* (p. 3)

The artist found himself here forced into the position of a jester who had no choice but to hold up a mirror to society in order to be seen. Michel (2006) commented on this as "*Irrational, sentimental, romantic, poetic, emotional and intuitive art became a complementary element to dominant self-concepts and worldviews. Pictures had the mission to bring us in contact with the subsurface of reason"* (p.117). This changing function in part pushes art drastically to the forefront and does this, for example, with three works that revolve around exactly these epochal changes in France, from the glorified image of the Sun King Louis XIV, to Delacroix's Revolution Painting (1830), to Siegmar Polke's 1988 work entitled "Liberte, Egalite, Fraternite" on which the guillotined and impaled heads of revolutionary leaders can be seen after the revolution had "devoured their children," in line with the famous quote by revolutionary Vergniaud of 31.10.1793. In the case of Polke as well as other contemporary artists like Förgs with his “beheaded bronce heads on iron rods” (1990), and Baselitz’s “lying boneheads” from the early 1980’s such artwork can be seen as anticipatory intuitions of the later Eastern European revolutions. Especially with contemporary artists such as the ones named above, it can be deducted that such a trend is not only historically traceable, but is always present in its treatment of things which are as yet incomplete and at the same time invoking the burgeoning new. This is the repeated theme of grand theorists, among other things, for example, in Beck & Cowan’s (2005) words that we are going forward and backward at the same time, or when Scharmer (2009) as part of his theory calls to lead from the emerging future. Morin (2008) writes about the consequences of such knowledge as part of his new complexity paradigm when he states

> *But what we are persuaded of is that if our current logico-mathematical apparatus corresponds to certain aspects of phenomenal reality it does not correspond to its truly complex aspects. That means that our logic has to develop itself, and go beyond itself in the direction of complexity. It is here that, in spite of his deep sense of the logic of biological organization, Piaget stopped at the edge of the Rubicon and sought only to accommodate living organization at the previously established logico-mathematic formalization.* (p. 21)
>
> *For it is obviously the whole structure of the system of thought that is finding itself thoroughly shaken and transformed.* (p. 35)

This segment has begun with the experience of a work of art by Gustave Courbet. By citing Morin on the issue of complexity it finally has led to recent developments within adult developmental psychology and consciousness studies. Consequently it is closed with a déjà vu like experience in May 2014. After speaking at the Symposium of the European Society for Research on Adult Development in Helsinki, I visited Kiasma Museum of Contemporary Art. While strolling inside the building with its staircases winding in different directions and with its slope like curving corridors, my gaze was captivated by another intensive gaze of a desperate person within a context of trauma. Having a closer look at "The Silence of Nduwayezu" (1997) was a moving experience for me. It so authentically made visible how overwhelming it can be to look into another person's eyes and how in these eyes for a compassionate observer can be revealed how frozen the whole self can become with such a traumatic experience as this child's one. In piling a million identical slides up in the artist’s installation, I got the impression of a monument for all the people with similar tragedies. The installation exposed, how a living/life-Gestalt, that should be light, able to develop and composed of a myriad of different "Augenblicke" (lucid intervals), which should be shaped into an individual trans-form of sense and meaning by the individuals themselves, can in such cases be shaped into a frozen, dark and uniform mountain of inescapability. Nevertheless human development happens against and sometimes in light of such experiences and this is, what psychologists like Frankl (2006, originally 1946) and later Antonovsky (1987) reported within their existential and positive approaches to psychology. Newer approaches (e.g. Slavin-Spenny et al., 2010; Tedeschi &

Calhoun, 2004) turn to the sometimes positive developmental impulses such a crisis can foster as well, while not neglecting the constraints which are nevertheless remaining. With the term “post traumatic growth” such a potentially wisdom oriented form of a postformal adult development after traumatic experiences is being investigated within contemporary psychology.

Most of the general adult developmental approaches heavily lean on the seminal work of Jean Piaget (1954) on individual cognitive development though. In his perspective human development ultimately leads to a final stage of formal operations only within adolescents and adults. The process of such a development can be described in the qualitative reorganization and refinement of meaning-making systems with a trend towards more complex and increasingly differentiated and integrated definitions of self and of the world. This development is driven by the tasks a highly complex environment has for the individual and the need to adopt and accommodate with this environment. In line with the conservative nature of mankind, in periods of environmental stability individuals would tend to assume that their models of the world are true replicas of it and refrain from further developmental endeavours which diminishes their potential for more complex and more integrative reasoning which can be seen as stages of development. Recent approaches within the field of adult development and structure genetic developmental psychology (Commons, 2008; Kegan, 1994) go beyond the assumption that human development is primarily of a cognitive nature and reach the final stage during adolescence. In their view postformal stages can best be described by a willingness of the individual to question the conventions and meaning structures which limit reasoning. As early as in the 1980’s adult developmental psychologists like Basseches (1980) described an advanced developmental stage that goes beyond adolescent formal operations towards a more creative postformal-operational stage of organization which reflects dialectical thinking. Leaders with a centre of reasoning in such a stage of nonlinear reasoning often adopt a systemic, long-term vision of complex developments as e.g. within their organisations and therefore can be identified as effective change agents (Rooke & Torbert, 2005). Peng and Nisbett (1999) framed the term “integrative complexity” for such an orientation. Finally Kallio (2011) argued for a postformal stage called “integration”, which involves the synthesis of opposing systems of knowledge into a “whole that is greater than the sum of its parts” – a phrase taken from Gestaltpsychology.

In the following segment I will argue for an artistic practice that has potential to give access to such more integrative and more complex stages of adult development by transcending and integrating formal reasoning and reveal the historic process that especially in the European culture has led to such a human development on the collective level. Within an approach that follows a more inclusive logic (Nolt, 2010) it is not only assumed but also lined out, that paradigmatic stances that are normally regarded as antagonistic can be temporarily reconciled to create complex transdisciplinary knowledge (McGregor, 2015).

Light and Shadow as Linked Phenomena Within the Artistic Endeavour: De-concealing Visual Expressions.
Neuroscience Spring School of BION (Giessen) May 2014

> *Prior to assuming roles as academics and learning the language of the academy, we did not put names on how we (and others) came to know the world. But, as professors, we*

> *quickly came to know that our jobs were in large part defined by our abilities to attach words of explanation to phenomena, experiences, processes, contexts, and systems. We soon discovered, however, that the predominant language – or discourse – of the academy did not ring true to us or how we perceived our task.*
>
> *We quickly became disillusioned by the moat of science and mysticism built to keep researchers in and communities out of the ivory tower. ... The language of the academy and all that it symbolized fell short in its ability to capture and communicate the complexity of human experience in all its diversity.* (Cole & Knowles, 2008, p. 57)
>
> corresponds to
>
> *To paint is to release extraordinary powers, because painting gives you a chance to invent a language and to venture into distant regions which are a long way off. I believe that painting takes us deeper than anything elseinto the unknown.* (Hundertwasser, 1973 taken from Hirsch, 2011, p. 143)

Within the scope of several planned and implemented neuro-economic publications that attempt to link current dual-process decision theories with adult developmental approaches (Lucas & Caspers, 2014; Lucas, 2013; Lucas, 2012; Caspers et al., 2011, Caspers et al., 2012), I took part in an event at the Bender Institute of Neurosciences (BION) of the University of Giessen. I considered many new impressions, in particular relating to carrying out such studies, on the basis of their epistemological dubiousness. When researching topics of interest with the aim of presenting research design possibly of relevance to the management team, an article by Vessel, Starr & Rubin (2013) caught my eye. In this paper, references to the importance of looking at art for the transformation of the self-concept are given from a neuro-aesthetic perspective. The starting point of the search was Starbatty's (2009) fundamental criticism on what he views as the outdated image of humans as "homo economicus,, which he formulated in his book "das Menschenbild in den Wirtschaftswissenschaften" (The image of humanity in economics) as well as Rost’s (2008) paradigmatic critique of the homo oeconomicus as a fiction of standard economics and Huebner’s (2005) “Dark Age” of innovation he frames for the condition modern economics are in. The dotcom bubble of 2000 and the financial crisis which began in late 2007 immediately preceded these conservative and progressive author’s contributions, which in the eyes of many people is seen as a moral judgment on the uncritical market idolisation of our post-industrial fiscally organised and structured society. Pareto (1906) originally stated that, as a basis of core economic theories, homo economicus should be understood to mean use and performance optimisation in the sense of rational maximizing choice. This optimistic human image of the economy continued the absolute rationalism of the early Enlightenment and expanded it to the operational performance of underlying meritocracy, but obscured the multi-dimensional nature of people and their deeper dialectic. However the pure homo oeconomicus could not be found within any human society in empirical cross-cultural research but within chimpanzees (Jensen, Call & Tomasello, 2013). Instead of a pure rationalistic maximizing behaviour, neuro-scientific dual-process theories of cognitive functioning postulate a dual nature of thought under varying titles and ascriptions (a compilation can be found in Evans, 2008) and with a conscious and a (when used in a more complementary way possibly superior) sub-conscious part (Evans & Stanovich, 2013).

Most often such theories distinguish between autonomously cued intuitive or “Type 1” processes that require few capacities traditionally seen as “cognitive resources” on the one hand and “more deliberate” “Type 2” processes that require working memory capacity on the other (Evans & Stanovich, 2013). The latter can be equated with Piagetian formal operations within developmental psychology. In concordance with Rosch (2008) and Depraz , Varela & Vermersch (2003) a necessary complementary way to foster postformal consciousness development focuses on developing the ability to grasp the essence of phenomena without going through “Type 2”-like mental analysis in and as an act of unprecedented creativity (Baron & Cayer, 2011). This act goes beyond cognitively recognizing and reframing meaning structures which in the end does not help to see beyond these structures. It thereby establishes a second form of “Type 1” process. In Rosch’s words this form of intelligence involves suspension of preconceptions and provides access to direct knowledge, which is imbued with basic wisdom.

According to Baron and Cayer (2011)

> *Overall this second way of fostering one’s own consciousness development seems to give rise to states of consciousness that are characteristic of the very advanced stages of consciousness, in which the subject-object duality subsides. These valuable experiences can momentarily increase the soundness of our decisions and indicate the path toward continued personal development.* (p. 350)

Art has long been pre-configuring such ideas with e.g., the painter Carl Gustav Carus (1846) writing before Freud *"The key to the understanding of the nature of the conscious inner life of man lies in the region of the subconscious"*, or as Victor Hugo (1827) before Jung wrote on the subject of the collective shadow *"Dealing with the darkness is the key to knowledge of the world.”*

The shadows therefore already before Jung’s contribution to psychology symbolises the negative, socially undesirable, and therefore suppressed personality traits, states and levels of development that are relegated to the unconscious. Looking to the future, the author of the surrealist manifesto Andre Breton (1924, p. 21) writes *"I believe in the future resolution of these apparently contradictory conditions of dream and reality into a kind of absolute reality, if you may so express it: surreality."* Such statements, however, make the artist suspicious to the economist. Freiesleben (2010) provides the alternative concept to the self-image of managers.

> *He attracts and repels, because he is both negation and reference to a synthesis ... thus he becomes a shadow, devalued. He dreams, he is unrealistic, he is undisciplined, his work is without plan or goal. He takes liberties where conventions and rules determine human interaction. The result is, as expected, unprofitable art. ... But the entrepreneur too has his clichés, in which he likes to be reflected: he is hardworking and ambitious, disciplined and responsible, his thoughts and actions are based on facts and figures, he is dynamic and assertive, always resilient, decisive, and willing to take risks. He likes being homo economicus, which defines economics for him as the ideal type of economic activity. When he renders his business account, the profit earned is the rightful proof of his power.* (p. 114)

Its dark side shows a meritocracy so composed that this early Enlightenment paradigm is reaching its limits, thus creating paradoxes and contradictions. As an example, the exclusion and devaluation of that which does not fit into the scope of the work should be mentioned. This does not only apply to the artist, but even more so to the long-term unemployed, who challenge our self-image and societal image. The long-term study "Deutsche Zustände” (German Conditions) by the Bielefeld Institute for Conflict and Violence (Heitmeyer, 2011) showed, for example, that 56% of respondents have a disparaging or hostile attitude towards the long-term unemployed. The director of the Institute attributed this to the fact that economic thinking pervades all aspects of life and the social division of society increases despite falling unemployment. Using representative surveys, the study has explored the causes of "group focused misanthropy" since 2002. Milton Friedman's neo-liberal theme from 1970 (The New York Times Magazine, September 13), “*The business of business is business. There is only one social responsibility of business - to increase its profits”* appears, however, passé. This is not least since the "Economist" (2010) showed an image displaying the textbook "Modern Economic Theory" melting with underneath the title "Where it went wrong – and how the crisis is changing it". In a corresponding way Chris Boyd in the same year finished his plastic "The Book of Darcebu," which exhibits a volcanic eruption to break forth through a book that was apparently constructed of solid metal. Instead, now the way Starbatty (2009) worded it may apply, namely

Homo economicus, as economists envision him - humunculus economicus would be better - is not the description of a man of flesh and blood, but an extremely simplified artificial model created intentionally for the purposes of analysis in the context of study. (p. 17)

Genuine neuro-psycho-economic theories emphasise, for example, the limited rationality of decisions which are not made purely rationally and that homo economicus lacks an emotional basis (Peters & Ghadiri, 2011). Gigerenzer (2007) transfers this to management as an appeal for more "gut decisions". With this the now stronger neuro-psycho economic authored economics begin to become more flexible to current economic paradigms, which are more strongly constructivist orientated. In fact, current postmodern contributions demonstrate an epistemologically problematic position in their primarily deconstructive orientation. Hence their explanatory contribution is ultimately limited. When Metzinger (2009) postulates the "Ego-Tunnel" as a new image of man, he means the following.

> *An Ego Tunnel is a consciousness tunnel that has evolved the additional property of creating a robust first-person perspective, a subjective view of the world. It is a consciousness tunnel plus an apparent self. We inescapably live our conscious live through the Ego Tunnel.* (p. 11*)*
>
> *Out there in front of your eyes, there is just an ocean of electromagnetic radiation, a wild and raging mixture of different wavelengths. Most of them are invisible to you and can never become part of your selective and low-dimensional conscious model of reality.* (p. 20)
>
> *Scientifically there is only this incessant, self-regulating flow of neural information-processing, constantly perturbed and modulated by sensory input and cognition.* (p. 23)

Ultimately, this definition of humanity is as ego which is equal to nothing in a self-constructed epiphenomenal tunnel. This means the ultimate consequence of the scientific endeavour into the mind leads to the negation of a human image and at the same time the negation of everything else, thus everything of importance. Thereby society has reached exactly the point to which rationally constituted science has led and indeed could only lead since the beginning of the modern era and its postmodern extrapolation. Bohm (1996) thus claimed that scientific knowledge is infected with misinformation which pollutes human experience and leads to an "endarkenment" of consciousness. A dis-continuation, would have to explicitly include a process-oriented, integrated-systemic and developmental perspective that considers first, second and third person approaches to the observation of consciousness. Lawrence (2005) describes from such a perspective, *"Mind is not an identifiable entity, it is a transformative process" (*p. 28).

A morphological psychology (Salber, 2003), which is orientated towards perspectives of Ganzheits- und Gestalt-psychology, applies an "art-inspired psycho logic" to the self, which is not only anchored in mankind or in his mind, and which can only self-assess via change. Thus, the very different experiential modes of experience, orientated on impirical (in addition to empirical) knowledge, become significant. Bearing this in mind, Kozhevnikov, Evans & Kosslyn (2014) can summarise the findings of their extensive studies on "Cognitive Style as Environmentally Senstitive Individual Differences in Cognition" in the following way:

> *Most visual artists described their work-related thoughts as spontaneous, uncontrolled and outside of – or even against – their own conscious wills. They reported that inspiration could come to them almost constantly and could be triggered by life and work events, emotional experiences, and visual experiences. In contrast, scientists typically reported that they were in complete control of their ideas, in terms of both frequency/time of occurrence and content. Furthermore research findings suggest that visual artists are usually more skilled in the holistic processing of pictures than are scientists.*
>
> *Moreover a number of studies indicated that differences between visual artists and scientists along the sequential/holistic dimension not only appear at the perceptual level but extended to complex problem solving, such as abstract conceptual processing and approaches implemented in professional creative work.*
>
> *Despite the reported differences between the analytical, rule-based approach style adopted by scientists and the intuitive style adopted by artists, substantial historical evidence suggests that intuition plays a major role in scientific work…different scientists may come to the same discovery using analytical or intuitive methods, which suggests that these methods may be equally important in science… Overall the differences between professionals in analytical versus intuitive processing indicate that, although visual artists typically appear to be intuitive and emotional and scientists typically appear to be rule driven and rational, the task sometimes may dictate the approach.*
>
> *Scientists who prefer an analytical style at lower levels of information processing might seek intuitive understanding at higher levels of information processing. They often adopt a*

> *sequential style of information processing and, at the same time, an intuitive cognitive style.* (pp. 20-21)

Within organization studies such an orientation is being discussed under the term "adaptive expertise" (Paletz et al., 2013) as a creative and at the same time efficient cognitive style of expert innovativeness within individuals and teams. It is being found especially in pressing, complex and new business situations when existing strategies are inappropriate. Such a view - incidentally, a view that is often called the view of the dark and the shadows - has long been self-evident to artists. As an example, here are only two contributions by artists based on their creative process and two theoretical contributions from the fields of psychology and art history. "*Close your bodily eye so that you see your image first with the mind's eye. Then bring to the light what you see in the dark, that it may react upon others from the outside inwards"* (Friedrich, 1829 taken from Hinz, 1968, p. 94).

> *When the free and compacted expression of my personal impressions can be seen in my romanticism, my renunciation of the tediously similar characters in schools and my aversion to academic formulae, then I must confess that I am a romantic.* (Baudelaire, 1856 taken from Muther, Dent & Dutton, 2010)

> *Artists have always used their work to show the culture what it does not see otherwise. Art often exposes the negative space that forms a background, allowing the objective to stand out.* (Higgs, 2008, p. 553)

Mario Praz (1981) uses the following statement by Thomas Hardy as leitmotif for his standard work "Die schwarze Romantik" (Dark Romantics).

> *As in looking at a carpet, by following one colour a certain pattern is suggested, by following another colour, another; so in life the seer should watch the complementary pattern among several things which his idiosyncrasy moves him to observe.* (p. 25)

This obviously does not only apply to scientists and artists. In the article by Vessel, Starr & Rubin mentioned at the beginning of this section, based on an orientation towards materialistic and scientific research, it was described, how even the experience of exchange and of encountering contemporary art can again and again guide in such a "self-creative" process of becoming and understanding.

> *We propose that certain artworks can resonate with an individual's sense of self in a manner that ´has well-defined physiological correlates and consequences: the neural representations of those external stimuli obtain access to the neural substrates and processes concerned with the self – namely the regions of the DMN. This access, which other external stimuli normally do not obtain, allows the representation of the artwork to interact with the neural processes related to the self, affect them, and possibly even be incorporated into them i.e. into the future, evolving representation of the self.*

> *Unlike in self-referential emotions, in aesthetic experience the relation to others is not focused on appraisal but on sense of understanding, gained insight and meaning. In fact self-relevance is an integral aspect of intensely moving aesthetic experience.*
>
> *A co-activation of the DMN and stimulus-driven sensory system as we have observed for strongly moving aesthetic experiences has so far not been reported in any other context. Yet, if our self-identity is to be influenced by the world we inhabit, it may be that similar moments should occur with greater frequency than would be expected based on the current conceptualization of the DMN as a network that is invariably suppressed during mental activity which is directed at the external world.*
>
> *By that view, much of our existence may be well-served by switching between periods of dominance of externally-directed brain networks over the DMN and vice versa, but those periods are punctuated by significant moments when our brains detect a certain harmony between the external world and our internal representation of the self – allowing the two systems to co-activate, interact, influence and reshape each other.* (Vessel; Starr & Rubin, 2013, Art 258, p. 6)

Their finding show that the activation of the DMN was even higher than found in any research on the correlation of consciousness and meditative practice which is in line with findings from the research of Eisenberg & Miron-Spektor (2014), which shows development of creativity only among individuals with high levels of cognitive development but low levels of so called naïve dialectical thinking – a term phrased for Eastern meditative based reasoning. Newer media science studies support this view. Vorderer (2011) emphasised that mental gratification may only be commonly explicable through a combination of intellectual and aesthetic levels. Schwan & Hesse (2004) posit a co-evolution of the media and cognitive apparatus. They emphasise that the media have generated new patterns of perception. And Batinic & Appel (2008) add that not only does the intensive use of computer games not corrupt the visual perception of reality, but on the contrary even intensifies it. In this context, they argue for a prevailing visual-cognitive restructuring of an entire generation.

This phenomenon can also be easily traced on a collective level. From a sociological perspective it is interesting, for example, to list most visited museum exhibitions in different European countries in recent years. The following crowd puller art exhibitions on a national level fit well into this image:

- Gothic Nightmares. Fuseli, Blake and the Romantic Imagination (Tate, London, 2006)
- Edward Munch and the Uncanny (Museum Quarter, Vienna, 2009)
- Crime & chatiment (Musee d‘Orsay, Paris, 2010)
- L‘Europe des esprits (Straßburg and Bern, 2011)
- Constructions of the irrational in the art of Fuseli to the present day (Neues Museum, Nuremberg, 2011)
- Black Romance (Städel Museum, Frankfurt, 2012)

This segment has argued for a fundamental ongoing and in conclusion postformal development within the individual and society as well as science being part of it. Examples of specific contributions of the arts to such societal and individual development have been exhibited. Different perspectives have been taken to make the case for a more visionary and inclusive approach to developmental and consciousness studies. The next segment will shed light on the methods used and the contents and predictions of such contributions on an individual and collective level.

The New Being in Contemporary Art and for Future Developments: Reconciliations - EGOS Conference Rotterdam, July 2014

> *When I paint, I am dreaming. I mean, when the dream is over, I can't remember what I dreamt, but the picture is there. It's the fruit of the dream. I put aside a part of my personality. It comes from somewhere else. I mean, I switch of my intellect, I let something else take over.* (Hundertwasser, 1973 taken from Hirsch 2011, p. 138)
>
> corresponds to
>
> *Art-based research can be defined as the system(at)ic use of the artistic process, the actual making of artistic expressions in all the different forms of the arts, as a primary way of understanding and examining experience and meaning by both researchers [artists] and the people they involve in their studies [e.g. observers].* (McNiff, 2008, p. 29)

I was at a conference of the European Group for Organizational Studies. There were very stimulating conversations in a standing working group on "Art, Design and Organization". The subsequent discussions with two professorial colleagues with leanings towards integral meta-theorizing also promoted interest in art-inspired questions about leadership, organization and societal trends. In preparation for a contribution, a debate took place over the important article by Eisner (2008), on "Art and Knowledge", among other things. Here in particular, the issue of what contemporary art is able to offer to leadership and organization research in terms of findings and paths of knowledge was investigated - and if, indeed, of course it may be a matter of further discussion as to whether this should be a role of such research. Niglas (2010) for example acknowledges art in her multidimensional Model of Research Methodology as one of the many valid paths to scientific knowledge. Eisner himself in fact put together four such contributions for leadership and organization research.

> *First the arts address the qualitative nuances of situations. By learning how to read the images the arts make possible, awareness of those nuances is made possible. The examination of perception of a painting is as much a kind of* reading *as a text might be. One needs to learn how to see as well as learn how to read in the customary sense (of trying to understand)….*
>
> *A second contribution the arts make to knowledge has to do with empathic feeling… that makes action possible.*
>
> *A third contribution the arts make to knowledge has to do with the provision of a fresh perspective so that our old habits of mind do not dominate our reactions with stock*

> *responses. ... To the extent to which we need to give up some of our old habits, the arts are willing and helpful allies in such a pursuit.*
>
> *Finally, ... the arts tell us something about our own capacities to experience the affective response to life that the arts evoke.* (pp. 10-11, Italics in the original)

A list of answers to the initial question, based on experience and concrete encounters with contemporary art, could, in my opinion, exist in the following central themes of contemporary art:

1. Pattern recognition of long-term critical paths
2. Intuition and presencing
3. Independence and complementarity rather than dialectical appropriation
4. Tunnel and head metaphors of underground(breaking) developments
5. Social complexity, blind spots within society
6. System theory and sustainability
7. Virtuality and constructed multi-reality as counter-worlds
8. Metacognition, transcognition, and collective embodiment
9. Integrated trans-formal synthesis of the arts

In the course of a single article it is evidently impossible to discuss all aspects of these eight trends, which for the time being have only been mentioned. Therefore in the following these aspects will only be briefly addressed and some well-known artists and their works will be referred to as representative of these themes.

1) Pattern recognition of long-term critical paths has already been explained by means of the historical outline carried out in the first section, and in particular on the basis of a work by Sigmar Polke. The artistic view here is focused on the past and attempts in particular to trace pictorial long-term trends. With respect to dealing with the topic of complexity, it has become clear that nowadays the ability to lead always implies long-term development beyond daily events and to be able to recognise disruptive paths (Deeg, 2009).

2) It is particularly important of course not only to look at the past, but also to recognise future developments. Methods of such (p)recognition are currently being discussed under a variety of headings in management training. Gigerenzer (2007) in this context frames the term "intuition." In the field of Organizational Crisis Management the ability to detect so called “weak signals” (Mendoncaa et al., 2004) can be seen as a crucial similar task. Senge et al. (2005) and Scharmer (2009) express such ideas using the keyword "presencing." In the field of artistic creation, such phenomena are well known and are often dealt with. This applies particular in surrealism. For example three surrealist works from 1932 are referred to here, all created simultaneously but completely independently from each other, and which are classified as having anticipated future catastrophic political events: Erwin Blumenfeld's "Skull;" Salvador Dali's "Ballerina as Skull;" and Max Ernst's "Europe after the Rain." Hans Hollein's performance of 1969, in which the artist exhibits on an open field with a typewriter and telephone sealed off only by head-high transparent sheets, which he dubbed "The mobile office – from a blessing to a curse," could be considered another example here of anticipation of the echoes of the technology-driven trend

towards virtualisation of the economy. And Jean Tinguely’s early self-moving and self-destructive installations such as “Without Title, Fontaine” (1960) give an impression of death of innovation, overproduction, meaningless consumerism and planned obsolescence of junk products (Gordon, 2014; Cowen, 2011) which leads to new and emergent macroeconomic models of a post-growth Next Economy which are currently discussed under terms such as e.g. Enoughness, Exnovation, Renovation and “Décroissance” (Degrowth) (Latouche, 2004).

3) In this sense, contemporary art often refers back to current trends towards the appropriation of artistic and other freedoms in terms of pure performance-driven exploitation of thought. Csikszentmihalyi's (2008) research on the phenomenon of flow, which in particular began on and with artists, in business practice however was degenerated and deformed by attempts of an economic planning. Thus the impossible question of "manufacturability" of the flow came to the foreground of economic study of the topic. The current art world is tackling the impossibility of such trends towards utilization. Stefan Panhans (2004) addresses this in his work when he presents the art world as a casting show and titles it accordingly "You actually just have to be you, just super." Agnes Husslein-Arco (2009) also states in her treatment of art history "No time, busy - exhausted self/borderless ability" that

> *In a world of the cycle of self-exertion, artists have become role models of a work situation in which unlimited creativity, smart self-marketing, self-motivated productivity, passionate commitment, and innovative ways of living and working are becoming increasingly important for management and employee entrepreneurs. Thus art becomes the host of the neoliberal approach of Ehrenberg's thesis of transporting the "exhausted self" into social reality.* (p. 6)

Under such conditions the artists of the group "neg-otium" push it to the extreme, by consciously playing with the Latin terms "otium" for leisure and "negotium" for labor. Echoing this, Werner Reiterer (2006) depicts himself as a hollowed lifesize doll, which seems to breathe only sporadically, and titles this work "The last heartbeat before dying frozen as a loop." Nicole Six and Paul Petritsch (2005) make portrait photos into series that seem to come from a photo box. The subjects appear so tired that over the course of the six photos they fall asleep. The collection is entitled "I'm too tired to tell you." Olaf Nicolai challenges the viewer to rotate a wheel of fortune, on which there are (as in society) only two options available, namely "Enjoy / Survive." Simon Moller (2010) exhibits himself as part of a performance sitting at the piano which, true to the chosen motto "'Melody Malady," the artist resolutely refuses to play. Finally Laura von Niederhäusern (2012) films schoolchildren at play in her video performance "Journey to Jerusalem," in which there is one chair less available each round until finally there is only a single chair for one child left. This radical critique of the logic displacement in a meritocracy is aptly referred to with the threatening title "Or I write." The same logic of denial is portrayed in films and computer games, in particular in the various forms of representation of transhumanity. In anti-utopian games such as "Deus Ex," and feature films such as "Terminator," social development trends are questioned and it is always outsiders who become heroes. In media psychology the use of smartphones as an “extended mind” is being investigated and described as a trans-humanistic way to supplant especially analytic “System 2” thinking leading to more intuitive cognitive styles within humans in a coupled cognitive human-computer system that goes beyond our brain. Barr et al. (2015) conclude in light of increasing accessibility to increasingly powerful personal technological devices such as smart watches, Google Glass etc. "*people may offload [analytic] thinking to technology, which in turn demands that psychological science understand the meshing of mind and media to adequately characterize human experience and cognition in the modern era of* post-biological intelligence*"* (p. 473. Italics in the original).

4) If contemporary art turns to a design of future scenarios, it often does so with the visual metaphors of tunnels and heads thereby reflecting scientific and societal conditions as described by Metzinger's ego tunnel. Here, the image designs of different media are, sometimes strikingly, alike. It is always the tunnel metaphor lying at the centre of the visual aesthetics here. Examples begin with the film "Stalker" by Russian director Andrei Tarkovsky (1979) and lead to Anselm Kiefer's megaproject "Over your cities grass will grow" (1991 to 2008), up to current computer games and simulations such as the trailer for the latest edition of the Tomb Raider series (2013). What is known as CAVE (Constructed Automatic Virtual Environments), which are accessible virtual computer-generated spaces that can, for example, migrate through the human body, can be seen as another example of such a tunnel metaphor in contemporary media. Jeff Wall (1989), who in his photographic art, for example, with "The Drain & The Well" that shows people at the entrance of tunnels and chasms, or Thomas Demand (2006), who forms artificial caves from papier mâché, and artists like Conrad Shawcross, who installed his art such as "Strike a chord (2009) in disused underground tunnels, can also be cited as examples in this regard. Moreover numerous works of art are vertical tunnels which convey an impression of a developmental perspective. Examples include James Turrell's (2011) "Above – Between – Below" and Ra Paulette's (2000) "Tree Cave – The vertical tunnel," an artificial tunnel that opens up towards the light through numerous pillars decorated as trees. The metaphor of the tunnel, however, shows on the whole how far the clear concept of social utopias of an advanced direction-focused one-dimensional logic of development has strayed into the unfathomable. In this light, Olafur Eliasson's "Your spiral view" (2002) can be interpreted as the unification of the head and tunnel metaphors of contemporary art.

> *Constructed from flat faceted plates, this tunnel is accessible via steps… Once inside, visitors experience themselves reflected infinitely in the mirror-polished steel plates.* (Langen Foundation and Boros Foundation, 2015, p. 138)

The curator Veit Loers reflects on such art and summarizes, that all of the important and expensive contemporary artists have worked with body and heads. For him this stems from "inner canal tunnels." At the same time, the tunnel is presented, and can be experienced by the viewer, as a kind of womb or cocoon; that is, as a kind of protective cover to prepare for a renewal and transformation. This is the case for example in Ainish Kapoor's gigantic installation "Leviathan" (2011).

5) Artists such as Gottfried Helnwein e.g. with "Inferno of the Innocents" (2011) or "The Child Works" (2011), and Bruce Neuman with "Double Poke in the Eye II" (1985) or Jonathan Meese and Tal R. (2005/2015) with their installation "Mother" devote themselves to the issue of violence as a blind spot in our society. A more systemic way of looking at society is offered by the artist Mark Lombardi with his "Political Sociograms," i.e. painted networks of power. Last but not least artists like Paul Laffoley with the collection "Secret Universe 2" (2011) directly response in an artistic way to the dominance of scientific inquiries to current trends and

developments within society. Such artists create visual expressions for grand theories of the past and present thereby reconciling art and science and bringing it in a renewed mutual exchange that goes beyond the linguistic and rationalistic limits still found today.

6) The Land Art founded by representatives such as Andy Goldsworthy also creates a network-like (eco-)systemic structure, however this is formed purely from materials that are found in nature and it is also only exhibited outdoors. The fact that they are exposed, conscious of the destruction caused by the forces of nature, emphasises and illustrates the fragility of our global ecosystem. Hundertwasser was one of the early proponents of ecological thinking with his images moving beyond the panel picture and out into spatial forms that integrated the surrounding architecture as soon as in the early 1950s and consequently introduced the concepts of minimal ecological footprint and restoring nature in cities with tree tenants in 1972 and his humus toilets, plant purification systems and storm-proof roof forests while writing

> *roof afforestation is the roof cover of the future. It will be natural to have a forest, or a wild meadow, or a vegetable garden on your roof.* (Mikunda, 2011 taken from Hirsch, 2011, p. 187)

He thereby pioneered what is noticeably today, for example, in urban design throughout public space.

Tomas Saraceno (2009) pushes this embodied systemic thinking to the extremes with his fragile network, filling a large space, and being presented with the title "Galaxies Forming along Filaments" after the reciprocal link and dependence of even cosmic processes.

7) In addition to these world designs and stagings, it is in particular the virtual and constructed counter-world designs engendered by the possibilities of new technologies which inspire the creation of art. Several designs are often offered concurrently, in terms of constructivism confronting the viewer with their own structure of the world, while at the same time offering the possibility of different perspectives in terms of a multi-reality, and thus of keeping it in their consciousness, transforming it, and ultimately breaking it up with aperspectivity. This applies in particular and as an example to the work of Michael Somoroff (2004) "Querry II-IV," in which a woman, alluding to Richter's "Ema on the stairs" goes down a staircase in four different artistic representations of increasing computerised abstraction. The same motifs can be found in current filmmaking, for example, in the movie "The Matrix" (1999) by the Wachowski brothers or the Buddhism-inspired Dutch film "The Sea that thinks." Video art also deals with such issues. We can mention here Bill Viola's (1979) "The Reflecting Pool" as well as "I believe it is an image in light of the other". The importance of such earlier post-formal stages of development and thus more meta-perspective and complex views for the management of complex organisations is especially emphasised in the contributions of authors such as Rooke & Torbert (1998) and Vincent, Ward & Denson (2015). According to newer media psychology contributions, for example by Trepte and Reinecke (2013, pp. 137-138), it is a central feature of media consumption to influence our cognition and emotion and as a consequence to influence our behaviour in many ways. This happens in particular because our view of the world is changed. Reinecke et al. express (2012) non-hedonistic needs as fundamental media-related needs of a higher order of personal growth and individual development. Under the keyword Gamification,

such growth needs are processed among other things in games such as "Epic Win" and used in games such as "Superstruct" for the advancement of society. Oliver & Rainey (2011) and Oliver & Bartsch (2011) added to this that the choice of media is made based mainly on the subject, with which the user will grapple vigorously, and on the artistic value of the representation.

8) Artist and constructivist philosopher Olafur Eliasson (2008) also creates entirely new trans-cognitive realities. His artworks follow the guiding theme "Space is Process" which sometimes achieve the dimensions of urban planning and development, resulting in spaces which it should be possible to experience and physically perceive as an embodiment. For him, the creative process is no longer to be understood as an expression of the cognitive and artistic subjectivity of a "self- actualizing man", but as a social-emotional physical expression of an involved collective, as Simonton (1988) also defines it in Sternberg's (2011) "The Nature of Creativity" as "Creativity of Leadership and Chance." Thus a radical departure from the hidden ideologies of the "Great Man" is connected to transformative leadership. Eliason (2008) worded it explicitly in this context, “t*his is what triggered my interest – the idea that you could reinterpret the meaning of the individual based on the experience of the artwork*” (p. 165. Italics in the original).

9) I would like to finish these explanations and lists of exemplary contemporary art with some artworks that can no longer be classified in a single genre. Kuspit (2013) refers to such overarching, mostly digital computer-generated creations in a real space of integrating art designs as synthesis of the arts or total work of arts. He expanded this by commenting *"No longer is the artist confined to familiar configuration. The artist can invent fantastic new configurations. Digital art can thus affect a profound alteration of consciousness itself."* Hans Breder (2000-2005) "Mass & No Word: No Thing" can be mentioned as an example here, a space that seems to increasingly dissolve in fog or "The Financial Crisis (Session I-IV)" from the Superflex group, an installation that allows the viewer to enter a darkened room in which a slideshow of exemplary photographs is displayed on a large screen; the impact of the financial crisis on individuals and entire societies alternating with the cinematically presented instructions of a hypnotherapist, who gives the instruction, *"I want you to wake up feeling fresh, comfortable and happy."* A circle is thus described that refers to the neuro-aesthetic contribution for self-trans-formation through artistic experience cited at the beginning of this article, thereby demonstrating opportunities for art-based post formal development.

Synopsis as Synthesis: A Trans-formative Mobius Strip at the Quadrennial Art Collection in Dusseldorf July 2014

> *And I dare say that the lines I trace with my feet on the pavement walking to the museum are more important than the lines I will find there hanging on the walls inside. And it pleases me enormously to see that the line I trace is never straight, never confused, but has a reason to be like this in every tiny part.* (Hundertwasser, 1953, taken from Hirsch, 2011, p. 62)
>
> corresponds to
>
> *When the content of our scientific discourse is abstract formulation, we are involved in the activity of looking for rather than in the direct experience of seeing. When one is*

> *attempting to fathom the nature of things through the medium of abstractions, it is as though one were looking for something. From this view we see that epistemology is the domain of the human experience of* looking for. *This impulse of* looking for *drives the knowledge-building systems of human thought in science up to now. When one sees something as opposed to looking for it, one participates profoundly in the seen within a self-transformational process.* (Petit, 2002, p. 105, Italics in the original)

If you ask the question of where and to what understanding the journey described here has taken me, you are entering another sphere of knowledge - and for this article, the last. Significantly, I found myself in a tunnel. This disused tunnel has been provided to Pauline M'Barek, a young artist, for her work as a part of the Quadrennial, a cross-museum art exhibition held in Dusseldorf every four years. Along with other works of art, she has filled the elongated tunnel with a huge, alternating white and black Moebius strip, "The tangible Border" (2014). It was possible to in/on a self-transforming way walk along the length of this Moebius strip and explore, and possibly assimilate, the aspects of light and shade in this dimension transcending trans-form. It inspired thoughts of the integrative visionary power of the arts by Joseph Nechvatal (2011) to flash through my mind. Manuela de Barros wrote in an internet article about such power of Nechvatal’s "Noisy viral threat"

> *This is art with a brain, for sure. But when a multitude of visions, Plato’s cave, the end of art, virtual data, viral de-con-struction, and environmental noise are put side by side, the message and meaning becomes clear. How can we step up from illusion to understanding? How do we go from shadow to light? And how can we break the chains that retain us?*
>
> *In the recycling of all the subjects contemporary art says, by a historical understanding; to cope with complexity directly with a refusal to fall back on the facileness of duality. We have to peel away layers of the cultural onion, enter into noise, and face the enemy.* (n.p.)

Along the way, I developed a view of art for research, creating new integrated perspectives. According to Sullivan (2008), it is thus possible to experience that

> *Artist-researchers create critical insights that are germane and current, and the viewer creates meaning within the critical contexts that inform the artistic encounter. This view asserts that the task of artistic or scientific inquiry is to create and apply new knowledge; however, these goals can be achieved by following different but complementary pathways.* (p. 249)

These personal experiences have become the expression of the complex unit postulated by Morin that complementary modes of being can be filled with life. In such moments, what Eisner (2008) formulated can be successful, namely to be “*multilingual in this research means being able to use different media (e.g. language and visual arts) effectively to represent what one has learned*” (p. 9).

Then it seems possible to follow Morin (2008) subsequently on an individual level

> *What we want to draw out, beyond reductionism and holism, is the idea of the complex unity, that links analytical-reductionist thinking and global thinking, in a dia-logic… This means that if reduction – the search for elementary, simple units, the decomposition of a system into its elements, the origination of the complex to the simple – will remain an essential characteristic of the scientific mind, it is no longer the only, nor, particularly, the last, word.* (p. 33)

On the collective level, what Ebert (2013) regards as the essence of Gebser's future design thus looks possible.

> *As Gebser's theory of this a-perspectival epoch implies, the artist paints his forms like the Palaeolithic artist onto the walls of the hyper-dimensional world cavern, where they float, and glow, all by themselves, as the structuring forms located in the deep recesses of the causal zones of Being that make everything in the physical world possible. This is for us to explore.* (p. 23)

This development would at least have to relate to future management training and established management. Thus art can be reunited as a partner to society and economy and the light which was separated in the Enlightenment can be reunited with its shadow in line with the aforementioned Moebius strip. According to authors like Covey (2006) or DePree (2004), leadership would thus become management art, which differs from pure management skills as they are frequently depicted today. Postformal reasoning would thus be both conscious of and enriched by the shadows. In this sense Galuska (2010) states, that

> *Economic life reflects in its light and shadow sides the current structures of human consciousness. It favours self-centred, unconnected and short-term orientated action. We are trapped in our own points of view and increasingly less able to adapt.* (pp. 121-122)

He summarizes, that a new form of socio-economic activity will therefore perhaps be an art of economies. Because under changing paradigms of our social and economic system, more complex structures and more complex corporate philosophies must be taken into account. This will not only require a kind of artistry in the leadership process, but result in differently weighted and thus more individual organisations and subgroups within society.

The final word is left to two artists. Picasso comments on the individual side of artistic creation when he explains that he never made a painting as a work of art and that all his work is research. Beuys expresses the social-collective dimension of the encounter with art as part of his expanded concept of art. He defines such a "social sculpture" by explaining that everyone is an artist who shapes the emergent future by his own development and the creative expression of it.

The Generality of Adult Development Stages and Transformations: Comparing Meaning-making and Logical Reasoning

Tom Hagström[1] and Kristian Stålne[2]

Abstract: Human development theories differ in "context sensitivity," covering those stressing development stages and those stressing continuously progressing changes. The former theories differ in whether, how and why the stages are regarded as being generalized across domains, i.e. their generality claims. Piaget's developmental stage theory of logical complexity of children and adolescents fulfill "strong" such claims, including fixed stage sequentiality of increasing complexity levels and higher stage structures integrating earlier ones. His theory has inspired a number of adult development stage theories with varying generality claims. These provide suggestions of stages and stage transitions reaching beyond "pure" cognition, integrating more of e.g. emotional, value and moral dimensions. From a neo-Piagetian perspective, core generality aspects seem to concern on the one hand logical reasoning and on the other hand meaning-making. This raises questions of how these aspects are related to each other in terms of stage structures and transformations.

The aim of the article is to discern general features in adult development stage structures and transitions, in terms of logical reasoning and meaning making. This is carried out by a "thought experiment" interrelating two theories that differ in these respects but that are both based on Piaget's theory, namely Robert Kegan's constructive developmental Subject-Object Theory (SOT) and Michael Common´s behaviouristic Model of Hierarchical Complexity (MHC). This comparing approach concerns the 3rd, 4th and 5th order of consciousness as well as transitions between these according to SOT, and order 9 to 12 and corresponding transitions according to MHC. The thought experiment indicates

---

[1] **Tom Hagström** is Professor Emeritus at the Department of Education, Stockholm University, licensed Psychologist and formerly senior researcher at the Swedish National Institute for Working Life. His research and theoretical frame focuses people´s scope of action and development in instable and changing work related contexts e.g. rehabilitation, unemployment, school-work transition and socialization, boundaryless work and decentralization, integrating qualitative and quantitative aspects methodologically. He was one of the initiators of a Swedish adult developmental research network.
Corresponding author.

that the generality claims of both models can be argued for without one of them necessarily being subordinated to the other one. Both theories are interpreted as differing but partly overlapping structures of coherence, while also being involved in transformative thesis-antithesis-synthesis processes. The possible interrelatedness between logical reasoning and meaning making is considered and discussed, as well as the relevance of differing generality claims, and contrasting subjectivistic and objectivistic "scientific positions." Finally, it is argued for the need of contextualizing adult development theory and research by relating it to postindustrial societal demands and challenges in terms of e.g. a "transform-actional" approach."

Keywords: Adult development, contextualization, dualities, generality, stages, subject-object structures, dialectical transformations, self-other coordination, differentiation-integration, hierarchical complexity, cognition, affection, meaning-making, logical reasoning.

Introduction

Studying human development across the life span is a field that includes several lines of reasoning. Developmental theories, taken as a whole, provide a wide and multifaceted view representing different traditions such as psychoanalytic, behaviouristic, cognitive developmental, socio-cultural, ecological, and life span perspectives (see e.g. Berk, 2010, Robinson, 2013). The conceptions of development vary with respect to qualitative and quantitative focus, continuous or discontinuous directions, one or more courses of development and the influence of nature and nurture. Moreover, the theories focus on differing aspects of development such as cognitive, emotional, motivational, moral, wisdom and spirituality domains. Overriding development issues concern causal mechanisms as well as the interconnectedness between different developmental lines and between different developmental domains. Causal mechanisms focus more or less on internal or external conditions as necessary or sufficient prerequisites for development, which indicates the "context sensitivity" of the theories. A well known demarcation line is the "inside-out" causal direction associated with Piaget's cognitive developmental theory (1982) and an "outside-in" causal direction associated with Vygotsky's sociocultural theory (1962), regarding the internalization and development of knowledge of the child and the adolescent (see Marti, 1996). Distinctions have also been made between cognitive developmental and contextual models (Pintrich, 2002). Cognitive developmental models stress the influence of internal drives, e.g. the drives towards cognitive equilibration elaborated in Piaget's thinking, which are regarded as at least sufficient conditions for change, while contextual models instead focus on external conditions challenging a person's thinking.

Thus, this multifaceted picture appears to be scattered, covering not only various theories and methodological approaches, but also reflecting differing epistemological and paradigmatic "scientific positions." One dividing line concerns a predominantly objectivistic paradigmatic position associated with the natural sciences and positivism, and a predominantly subjectivistic paradigmatic position more common in social sciences and the humanities (Cohen, Manion, & Morrisson, 2000). The differences seem to concern at least three interwoven aspects of relevance for life span development, namely a) focusing on the study object from "inside" or "outside," b) focusing on formal aspects or the content in development and c) using quantitative or qualitative data approaches. These three aspects can be seen as more or less interrelated depending on the extent to which they are embedded in broader paradigms (see e.g. Bryman, 2004). However, generality features in human development bring to the fore at least two theoretical and paradigmatic issues: the causal mechanisms involved and the continuation-discontinuation character of the change process.

Issues regarding the kind and degree of continuation-discontinuation are related to how development is conceived, compared to changes in general. A common understanding seems to be that even though all development concerns changes, all changes are not regarded as development. The latter require some kind of systematic character and direction of the change process (Hagström, 2003). Additionally, further classifications require more precise conceptualizations and definitions of what constitutes development in terms of e.g. stages and transitions between them. Strong ”organismic” conceptions of development state criteria such as universality, fixed sequentiality, irreversibility, qualitativeness and the notion of an end state (Baltes & Nesselroade, 1979). The variation in conceptions of development may also be described in terms of hard, soft and functional models (Kohlberg & Armon, 1984). Hard theories consider development as a process of universal sequences that emanate from a total reorganization of a latent cognitive frame of reference**.** Functional theories refer to every stage developing for the purpose of carrying out a new task or fulfilling a new function (Ericson, 1968). Soft theories focus on the development of different personality traits, education, and social background.

General features in human development tend to be related to hard theories and strong development criteria, the cognitive domain and logical reasoning. Piaget’s stage theory of logical thinking fulfills strong development criteria of hard approaches, such as fixed stage sequentiality of increasing complexity levels, with higher stage structures integrating earlier ones. Neo-piagetian theory and research have suggested a number of stages and stage transitions over the life span, beyond strict logical reasoning or “pure” cognition, involving more of meaning dimensions. Their “hard-soft” position and context sensitivity vary and they focus on differing domains such as moral development (Kohlberg, 1969), postformal thought (Sinnott, 2003) and ideals of a life and good work (Armon 1984; 1993).

However, the generality claims also vary among “hard” stage approaches. This raises the questions of whether and why certain domains would be more general than others and in what respects that would be the case. The domains refer to the content of the stages. This, in turn, is associated, directly or indirectly, with their functions in relation to demands and challenges in life. Among neo-Piagetian “hard stage” theories, the Subject-Object Theory (SOT) (Kegan, 1982; 1994), which focuses on a person’s meaning making, is associated with high generality claims, higher than e.g. among rather closely related approaches such as the moral development theory developed by Kohlberg and colleagues (Kohlberg, 1969). Advocates of the latter theory (Colby, Kegan et.al., 1987) have considered their approach as less general than the SOT, which they consider to be an extremely general approach. They argue that in SOT .”..the structure... forms a single coherence system across all domains” and that “The differences between thinking in different domains result from the application of a single cognitive structure to different contents.” (p. 8, opt. cit.) Since both these theories fulfill formal “strong” development criteria, the higher generality features concern other aspects.

To conclude, logical reasoning and meaning making appear to stand out as “domains” that raise especially high generality claims. Moreover, in both cases these claims seem to reach beyond the generality features associated with “hard stages” or strong development criteria. These criteria mainly appear to express “formal” features of the development process. If so, logical reasoning and meaning making can be assumed to constitute other generality features in the development process, related to e.g. their content and/or their functions. This brings to the fore questions regarding the possible interrelatedness of logical reasoning and meaning making. Are they to be regarded as general but mutually isolated lines of development, and, if so, in what respects can they be regarded as general? Are they subordinated to each other with respect to generality, and, if so, how and why would that be the case? Furthermore, are they interrelated, and, if so how and why would that be the case?

Among neo-Piagetian theories, inspired by Piaget but reaching beyond logical reasoning and adolescence, high generality claims have also been stressed by the Model of Hierarchical Complexity (MHC, Commons and colleagues). MHC represents a behaviouristic approach, taking Piaget’s cognitive-logical approach as a point of departure, but explicitly delimiting its focus to the axiomatically derived logical dimension. The meaning making process of the SOT approach also has Piaget’s cognitive-logical approach as a starting point, but integrates this aspect in a constructivist meaning making context. The MHC and SOT theories have taken diverging routes away from Piaget’s theory, which seemingly has made the theory’s logical aspect and its meaning aspect involved in logic, explicit. Therefore a systematic comparison of these two explicit conceptions of logical reasoning and meaning making in stage development, might be a plausible base for answering questions about their generality claims, such as those mentioned above. Moreover, this may also contribute to the elucidation of issues concerning the relations between stages and their transformations, as well as the “inside-out” and “outside-in” “causal directions” of the development process. An interlinking comparison of these two theories can be regarded as a base for further theoretical considerations about generality features in a developmental-transformational perspective.

Therefore, the *aim of the article* is to discern general features in adult development stage structures and transitions in terms of logical reasoning and meaning making by interrelating the MHC and SOT approaches in a systematic, comparing “thought experiment” which will be further described below. Both of these theoretical stage models describe people’s frames of reference in terms of sets of strategies for coping with the challenges of life as a whole, rather than focusing on or dealing with limited domains only. In order to achieve the aim, a departure in the basic roots of the two theories seems to be necessary, namely Piaget’s constructivist-developmental way of thinking. What did he mean by logic, how did he relate logic to meaning and what did he refer to as meaning?

A Departure in Piaget: “Psycho-logical” Constructivism

Piaget’s well-known theory of logical thinking includes four main developmental stages, namely the sensorimotor, preoperational, concrete operational and formal operational stage. When concrete operations take place, approximately between ages 6-10, the thinking increasingly reaches beyond the sensory, intuitive or “magical” level. The concrete operations enable making inferences, such as addition and multiplication, of classes but are restricted to concrete objects. The last, formal operational stage has its onset approximately from age 11 and onwards. In its most developed form, this stage enables logical thinking such as performing deductive hypothesis testing and systematic variation of variables. This stage structure is, although not undisputed, well established and will not be elaborated in more detail here. However, Piaget's understanding of the developmental process seems to be less well known. He related the developmental process to people's active construction and reconstruction of their thinking. This, in turn, was understood as being driven by assimilation to a given cognitive structure and accommodation of that structure – to adapt it to new experiences that do not fit in the prevailing structure – in an equilibration process. Epistemologically this can be said to advocate "…a position that knowledge is neither innately preformed in the mind nor directly copied from the environment" which also implies that "…individuals...are active agents in their own learning and development" (Amsel & Smetana, 2001, pp. 3-4). Thus, the generality claim of Piaget's theory is not restricted to the structure of logical thinking. It also conceives such structures as being involved in an active and interactive process between the person and the environment. The latter position underlines the importance he attached to the social context and the socialization process in the development of logical thinking.

Critics of Piaget's theory argued that logic and cognition in his theory were conceived as developing in a "social vacuum" and that people's substantial development would end with the acquisition of formal operative thinking. However, he moved from an earlier "functionalist phase" stressing social-interactive aspects related to logical thinking, to a "structuralist phase" focusing more on the internal logical thinking structures and eventually took both aspects into account as mutually related (Lourenco & Machado, 1996, see also Garcia, 1991). Much of the criticism does not seem to have taken into account the dialectical, constructivistic and developmental character of his approach and that he basically focused on an operational, not an axiomatic, logic (Lourenco & Machado, 1996). Although it was not his main focus, his model of formal operations "…from the very beginning underlined the conception of knowledge as always involving organization, inference and meaning" (Lourenco & Machado, 1996, p. 157). In these terms, development was considered as a way to eliminate sources of equilibration and the construction of new balances at higher complexity levels. Equilibration was defined as maintaining constancy (order) in an external context of continuous changes. The reorganization of one structure to a qualitatively new one, towards more complex stages, is an expression of qualitative "leaps" (Piaget, 1978).

Piaget's focus on the development of logical reasoning in these respects, did not mean that he regarded it as separated from the affective aspect of development. These aspects were rather considered to be closely interwoven: "The two aspects, affective and cognitive, are at the same time inseparable and irreducible." (Piaget & Inhelder, 1969, p. 158) and joined in a "functional parallelism" without one of them determining the other (Piaget & Inhelder, 1969, pp- 347ff.). Emotions were regarded as important due to their involvement in conflicts, crises and reequilibrations. This in turn, he related to the formation of personality, which he viewed as "... dominated by the search for coherence and an organization of values that will prevent internal conflicts..." (Piaget & Inhelder, 1969, p. 158). Thus the search for coherence, including e.g. value conflicts, was seen as interwoven with logical reasoning in forming the self-regulation of the individual. The highest complexity level in his stage theory, full formal operational thinking, is characterized as the capacity to think about thoughts and to reverse relations between what is real and what is possible. This, in turn, constitutes a base for building ideals as an adaptation to society but not in strict isolated sequential orders: “Obviously, this does not mean that formal structures are first organized by themselves and later applied as adaptive instruments where they prove individually or socially useful… logic is not isolated from life; it is no more than the expression of operational coordinations essential to action” (Inhelder & Piaget, 1958, p. 342). In the formal operational stage, the adolescent has the cognitive capacity to analyze his or her own thinking as well as construct theories, which makes it possible to “…furnish the cognitive and evaluative bases for the assumption of adult roles, without mentioning a life program and projects for change. They are vital in the assimilation of the values which delineate societies or social classes as entities in contrast to simple interindividual relations” (Piaget & Inhelder, 1969, p. 340).

Thus, Piaget conceived logical reasoning as being interwoven with the values guiding adolescents’ goals, when searching for coherence in terms of their adult roles and functions in society. Affective and personality development was considered to be integrated with intellectual and moral development, in a framework that has been characterized as his social theory: “Just as affect is an indissociable motivational element in intellectual development, socio-affective bonds (or their lack) motivate social and moral development” (De Vries, 1997, p. 4). Piaget himself stated that: “Each progress in logic is equivalent, in a non-dissociable way, to a progress in the socialization of thought” (Piaget, 1950/1995, p. 85) and that “…individual functions and collective functions require each other in the explanation of the conditions necessary for logical equilibrium” (Piaget, 1950/1995, p. 94). Thus affection, values and social processes were seen as interrelated. His focus on logic can be expressed as a “psycho-logic.” Piaget’s model reaches across and beyond different domains of thinking and was therefore hard to grasp for a number of colleagues in other knowledge domains. He e.g. “…used too much logic for psychologists and too much psychology for logicians” (Lourenco & Machado, 1996, p. 156). He was criticized for connecting different kinds of logic that did not seem to fit together and for violating norms of logic. However, his focus was not on pure logic: “…unlike logicians, Piaget was not interested in purely formal issues, or issues internal to logic, such as axiomatic foundations. He wanted to develop an operational logic, a logic of action, a logic that in some sense would be a *“tertium”* between psychology and axiomatic logic... a logic that would be a truly ‘psycho logic’” (Lourenco & Machado, 1996, p. 156; Piaget, 1953, pp. 23-26). This may explain his mixture of different kinds of logic.

During the last years of his life, Piaget substantially revised his model of logic (Piaget & Garcia, 1987). He thought he had taken too much account of “…Aristotelian truth-value tables and failed to solve the well-known paradoxes of material implication, that is, statements logically or formally correct but without meaning” (Lourenco & Machado, 1996, p. 157). He instead tried to develop an intentional logic with meaning implication understood as: .”..an implication in which p implies q if and only if a meaning of q is incorporated in that of p and this meaning is transitive” (Lourenco & Machado, 1996, p. 157). Meaning implication and material implication were basically regarded as two types of inference, where only meaning implication implied necessity: “In those cases in which there is a necessary rather than a contingent relation between the antecedent and the consequent, an entailment of meaning implication exists” (Lourenco & Machado, 1996, p. 157). He moved towards an operational logic where e.g. formal operations are characterized in terms of an internal necessity, which differs from pre-operational thinking. This necessary feature of formal thinking may be understood as not only organizing a person's thinking in a logical-mathematical sense, but also as a potential for testing and analysis of internal and external phenomena covering emotionally loaded value aspects. Piaget's increasing interest in taking the role of content and context into account and relate these aspects to logical reasoning apparently corresponds to an increasing interest in meaning in development. His "psycho-logic" constructivistic approach covers both logical reasoning and meaning making. However, the concept of meaning is multifaceted and not undisputed. Piaget did not, as far as we know, elaborate more extensively and systematically on how core aspects of meaning making are related to Ego development in terms of relating oneself to social contexts and the meaning constituting aspects of this. As mentioned, further clarifications of the generality claims of the logical reasoning and meaning making aspects derived from Piaget's thinking will be elucidated by comparing the SOT and MHC understanding of these aspects. Before this will be further elaborated through a "thought experiment," these theories will be briefly described starting with SOT.

The Subject-Object Theory (SOT)

Below the SOT will be briefly described in terms of stage structure and change dynamic.

Main Character and Stage Structure

Robert Kegan's Subject-Object Theory (SOT) was, as described, strongly influenced by Piaget's thinking, but also by other neo-Piagetian theories such as Kohlberg's moral stage theory (1981). However, he was also influenced by less cognitively and constructivistic oriented neo-Piagetian theories, such as Loevinger's (1976) inductively based model of development (Hy & Loevinger, 1996**)**, as well as other lines of thinking, such as neo-Freudian psychodynamic object relational theory. His neo-Freudian influences also included the conception of an ego developing across functional life stages in relation to the social-cultural context, as elaborated by Erikson (1968). Thus, he came to conceive ego as an evolving self, interacting in a social-societal-cultural context and guided by a frame of reference that involved logical reasoning but that was integrated in a broader meaning making process. On the basis of interviews with 39 persons in therapy, he interpreted the meaning making of a person as being characterized by underlying and unspoken assumptions that people took for granted. These assumptions were regarded as presuppositions to and thereby constituting the very foundation of our meaning making.

The development of meaning making is here described in terms of balances and dynamics between a subject and an object at increasing complexity levels. This is one core characteristic of the theory. In the initial balanced phases of the stages, the ego is conceived as a subject embedded in its assumptions that are unconsciously taken for granted, assumptions, which are called Big assumptions (see e.g. Kegan & Lahey, 2009). These constitute the meaning making of the subject who the subject intuitively and unreflectedly "is." On the other hand, there are thoughts and other mental entities that the subject can reflect on, something that the subject "has" as objects of awareness. Thus, each stage can be seen as the consequence of a given subject-object balance, the structure of a given stage defining the current meaning making of the person in question. The transitions and transformations between the stages are conceived as a differentiation from a given balance towards integration in a new balance. Such new balances

"…further differentiate the self from its embeddedness in the world, in a qualitatively new way…," and "thereby creating a more integrated relationship to the world" (Kegan, 1982, p. 294).

The SOT covers five stages of increasingly more complex subject-object balances. In the first *Impulsive stage* the subject "is" its perceptions, social perceptions and impulses and its objectified earlier subject, its prevalent object, is its movements and sensations. In the next *Imperial stage* the former subject has become the object for reflections and the subject now "is" its taken for granted conceptions of concrete elements and relations, as well as its enduring needs and preferences associated with e.g. its concept of taking a role which enables simple social reciprocity. These stages appearing from early childhood, are followed be three stages that have been found to cover the majority of adults in late modern societies (Kegan, 2003), namely the *Socialized mind* (the interpersonal stage), the *Self-authoring mind* (the institutional stage) and the *Self-transforming mind* (the interindividual stage).

The latter three stages, which are the ones that will be applied in the "thought experiment," are briefly described in Table 1 below.

Table 1. The Subject-Object theory (SOT): Consciousness stage/order 3–5 (based on Kegan, 1994, 2003).

Stage/order	Subject	Object	Underlying structure
3. The Socialized mind	**Interpersonal:** Role consciousness **Cognitive:** Ideality; abstractions **Intrapersonal:** Self consciousness	**Interpersonal:** Role concept **Cognitive:** Actuality; concrete **Intrapersonal:** Self concept	**Cross-categorical**
4. The Self-authoring mind	**Interpersonal**: Multiple role consciousness **Cognitive:** Ideology; relations between abstractions **Intrapersonal:** Self regulation	**Interpersonal** Role consciousness **Cognitive:** Ideality; abstractions **Intrapersonal**: Self consciousness	**System**
5. The Self-transforming mind	**Interpersonal:** Self-other interpretation **Cognitive:** Trans-ideological; relations between forms **Intrapersonal** Interpenetration of selves	**Interpersonal:** Multiple role consciousness **Cognitive:** Ideology; relations between abstractions **Intrapersonal:** Self regulation	**Trans-system**

As can be seen in Table 1, the subject-object character of the three stages covers interpersonal, cognitive and intrapersonal aspects. According to Kegan (1994), the Socialized mind corresponds to Piaget's stage of early formal logical operations, the Self-authoring mind to Piaget's full formal logical operations, while the Self-transforming mind exceeds the highest of Piaget's stages. The "positions" of logical structures within the balanced phases of the stages and within the unbalanced phases of their transitions, will be further considered as a main issue in our "thought experiment." The Socialized mind is related to a smaller close group context, the Self-authoring mind to a broader societal-institutional context and the Self-transforming mind to a still broader symbolic ideological context. The "broadness" aspect reflects increasingly complex conceptions of how these contexts are organized and coordinated hierarchically.

The SOT Transitions

The concept of Big assumption presented in relation to the Immunity to Change (ITC), was developed as a way to overcome the emotionally or even identity threatening dilemmas related to stage transitions (Kegan & Lahey, 2009). Thus, the construction, deconstruction and reconstruction of Big assumptions in the process towards higher complexity, involve consciously experiencing things that question the subject's identity base. The transformation towards higher stages of meaning making has been found to be triggered by situations of optimal conflict in which the inadequacy and the limits of the current structure become evident to the transforming person.

Such conflicts in the transitions from the Socialized mind to the Self-authoring mind are those between defining oneself in the context of others' expectations, on the one hand, and an emerging orientation towards considering ”what is it I want," on the other hand (Lahey, *et al.*, 1988). Tensions here are e.g. *between* "Feeling vulnerable to incorporation, fusing, loss of myself as own person (self anger)" *and* "Feeling selfish, heartless, cold, uncaring as a result of beginning to consider me first" (Kegan, 1982, p. 270). Conflicts in the transition from the Self-authoring to the Self-transforming mind are associated with the conflict expressed in: "What before was experienced as a competent exercise of one's psychological independence can come to be felt as a kind of troubling remoteness or isolation, interpersonally and internally" (Kegan, 1982, p. 116). Tensions here are e.g. *between* "Feeling vulnerable to crippling self- attack, to identifying with my performance, isolated in self-containment," *and* "Feeling weak, ineffective, out of control…feeling evil, decadent, loss of identity, boundary loss (self-loss)" (Kegan, 1982, p. 270).

The transitional steps between each of stages 2 to 5, describe the extent to which a structure has been made an object (Lahey, *et al.*, 1988). The interview procedure follows a tradition of the Piagetian semi-clinical interview, further developed by questions about the interviewed person's real life experience. This includes emotional, cognitive, as well as intrapersonal and interpersonal aspects of psychological organization. Such real life situations are elicited from a series of ten uniform probes that are explored to discern their underlying epistemology. This will be further elaborated in the "thought experiment."

The stage transitions are described as six qualitative transformations from one subject-object balance to another, which are designated as: X, X(Y), X/Y and Y/X, and Y (X), Y. Among these, X and Y refer to a subject-object balance in complete equilibrium and the four positions between these two balanced orders are more or less in disequilibrium. The X/Y or Y/X positions refer to which structure is ruling (Y/X means Y is ruling). This process will be further described in the "thought experiment" below. Suffice to mention that the transformation from one subject-object in equilibrium, X, to the next higher consciousness order, Y, reflects an internalization process, embedding the former X structure as a subordinated structure in the emergent Y structure.

The Model of Hierarchical Complexity (MHC)

In the same way as SOT was presented above, MHC will be briefly described below in terms of stage structure and change dynamic.

Main Character and Stage Structure

Michael Commons' MHC is, as mentioned, another approach to addressing the problem of the variety of different stage theories and ~~of~~ their respective manuals, although mainly for clarifying Kohlberg's scoring procedure (Commons & Ross, 2008). Commons and colleagues proposed a solution to this in their general stage model (Commons & Richards, 1984), later renamed the general model of hierarchical complexity, and finally the Model of Hierarchical Complexity or MHC (Commons, 2008). The generality claims here focus on logical reasoning in a strict axiomatic-mathematical respect, which is regarded as the necessary base for other domain specific developmental lines. A manual was developed in accordance with this theory with the aim of being able to score reasoning or any form of conceptualized information regardless of the domain involved (Commons, Miller, Goodheart, & Danaher-Gilpin, 2005) – while also claiming to replace all other manuals in this area. In line with this, *decaláge* is not regarded as a problem for the theory, but rather as a consequence of the fact that a person's stage of performance typically varies between different domains.

As mentioned, this is a content-free and scale-free model or framework for scoring different stages of development, regardless of the domain and content (Mascolo, 2008). The hierarchical complexity is instead described in terms of the structure of the information being organized when a task is being solved. MHC can be said to be based on mathematical principles, e.g. how information is organized and information theory. The model defines 16 orders of hierarchical complexity. Order n+1 is defined by the successful and non-arbitrary coordination of two or more elements from order n, according to the theory's axiom. The orders are thus derived analytically and regarded as objective and ideal forms. Tasks are defined for the respective orders, and the behavior carried out in the attempt to complete the task is referred to as the performance. A performance is either successful or not and the term stage refers to the successful completion of a task of that order. The theory also takes into consideration the amount of support, or help, that the person receives when completing the task.

These orders (and stages) include the development of additional stages of increasingly complex logical thinking, compared to Piaget's stage model. Piaget's first Sensorimotor stage corresponds to MHC orders 0–3, Piaget's second Preoperational stage correspond to MHC orders 4–5 and Piaget's Concrete operational stage corresponds to MHC orders 6–8. Here we will summarize some main features of the stage structures and their transformations, from the 9th abstract order to the 11th systematic order of hierarchical complexity. These orders cover Piaget's early formal operational and full formal logical operations, while MHC's 12th to 14th order – metasystematic, paradigmatic and cross-paradigmatic – exceed Piaget's highest formal-operational stage.

Before the 9th abstract order the child is capable of e.g. logically carrying out full arithmetic as well as analyzing concrete objects, actions and situations, which enables an understanding of mass and length as quantities that are independent of how or by whom these are perceived. But everything that is stated or reflected on corresponds to something concrete in the exterior world.

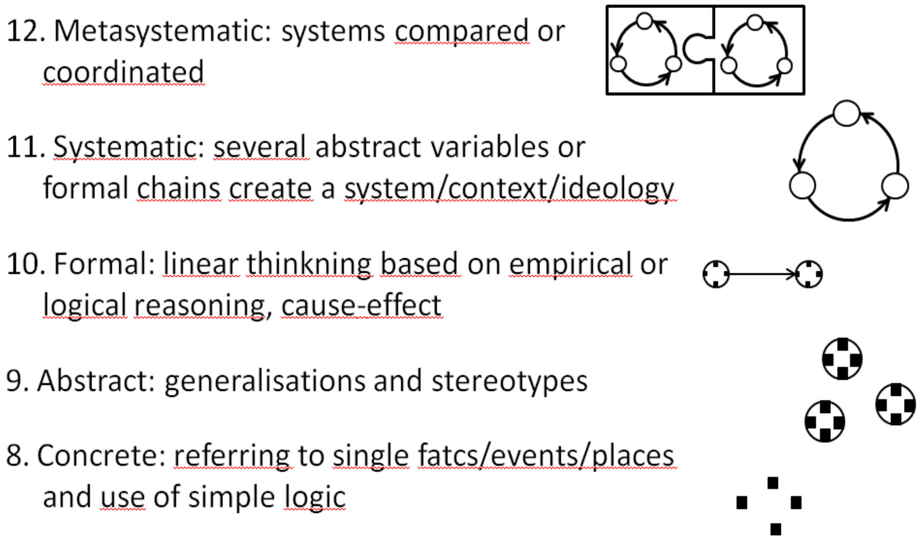
In the 9th abstract order these concrete elements can be coordinated to form abstract variables that do not correspond to any single factor object in the exterior world. This enables generalizations and the conception of abstract categories such as stereotypes (e.g. immigrants, leaders), personality traits (e.g. unreliable, benevolent), quantifications (e.g. no one, always) or abstract variables such as x and y, beyond specific and concrete positions and points of time**.** Imperatives of what one should and should not do are typical; x and y can be used and be related to without corresponding to any single value.

In the 10th formal order two abstract variables, such as x and y can be coordinated, typically in cause-and-effect relationships of the form "if x then y." These can be found in logical deductions, formulations of hypothetical simple physical laws and linear unidirectional and one-dimensional functions, or in the solving of equations with one unknown variable. Examples include statements such as "an increase in the amount of carbon dioxide in the atmosphere leads to global warming" or "higher GDP leads to greater happiness."

In the 11th systematic order, at least two formal relationships need to be coordinated to create a coherent system, such as a feedback loop: "An increased level of carbon dioxide leads to global warming which leads to an even higher level of carbon dioxide…" Formal relationships can be understood in different contexts, such as different cultures, ideologies, legal systems, eco-systems and discourses. Multivariate systems, functions and matrices are constructed and equations with more than one variable can be solved.

In the 12th metasystematic order, metasystems can be created by coordinating more than one system. Systems, cultures or ideologies are seen as limited and coherent systems that can be compared or combined. Different cultures and value systems can be compared or be shown to interact. Phenomena such as sustainability are understood by coordinating the different aspects or dimensions of it, such as economic, ecological and social. The characterization of the logic from the 8th to the 12th order of MHC, as well as the transition steps, are shown in Figure 1 below.

As described, the orders of hierarchical complexity define the tasks that are to be completed. A task at a certain order consists of carrying out and coordinating sub-tasks at lower orders, which can be illustrated by means of a pyramid structure according to Figure 2, where task *a* at a higher order coordinates the two elements *b* and *c* from a lower order of hierarchical complexity. The elements *b* and *c* can be seen as subtasks that need to be successfully completed and coordinated in order to complete the overall task *a* successfully.



12. Metasystematic: systems compared or coordinated

11. Systematic: several abstract variables or formal chains create a system/context/ideology

10. Formal: linear thinkning based on empirical or logical reasoning, cause-effect

9. Abstract: generalisations and stereotypes

8. Concrete: referring to single fatcs/events/places and use of simple logic

Figure 1. Description of order 8 to 12 in the Model of Hierarchical Complexity (MHC).

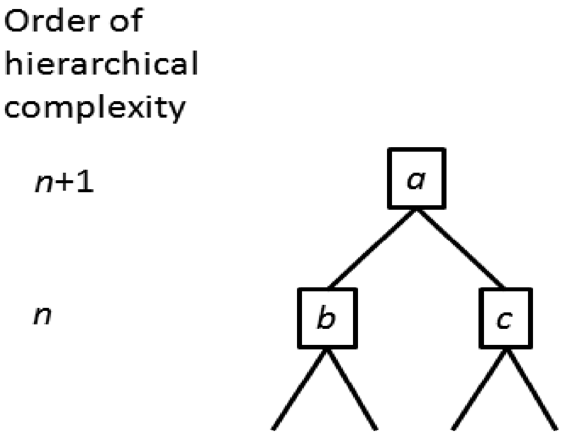


Figure 2. Illustration of a hierarchical structure having three elements, *a* at order *n*+1 that coordinates the sub-tasks *b* and *c*, which are elements of order *n*; *b* and *c* in turn, coordinate lower-order elements.

The symbols *a*, *b* and *c* represent content, while the pyramid's form represents the relationship between them, the way they are organized, or the structure. This is the common way of representing a complex task in accordance with MHC (Commons, 2008). According to the axioms of MHC, that describe how conceptualized information of any sort becomes organized, an element or an object at a certain order has to coordinate at least two elements from the previous order in a non-arbitrary way, for a higher order of hierarchical complexity to emerge.

The MHC Transitions

As a part of the theory, the transitional steps between the different stages have been defined (Commons & Richards, 2002; Commons, 2008; Ross, 2008). These steps demonstrate the fractal nature of the progression, in terms of complexity, between two successive orders. The cycle is repeated again and again from one order to the next, following the pattern of thesis, antithesis, relativism, smash and finally a synthesis, which is the thesis of the next order. This process is illustrated in Table 2 below.

Table 2. MHC transitional steps.

1. Thesis	*a*	Thesis *a* at stage *n*. The thesis starts to deconstruct. It does not seem to solve the present task.
2. Antithesis	*b*	*a* is rejected and an antithesis *b* is formulated that appears to be the opposite of *a*.
3. Relativism	*a* or *b*	A state of ambivalence in which it is either *a* or *b* that seems to be correct, but one cannot decide which.
4-7. Smash	*a* and *b*	A synthesis begins to form in a chaotic, four-step process in which it is acknowledged that both *a* and b are needed.
8. Synthesis	*a* with *b*	Synthesis – a new equilibrium has been reached, a new thesis having been created by the successful coordination of the previous thesis *a* and antithesis *b*. The new synthesis defines the thesis at stage *n*+1.

Summarizing Conclusions: Similarities, Differences and Possible Interrelatedness

After this introduction of SOT and MHC, a systematic comparison between the logical reasoning and meaning making according these theories will be performed to shed some new light on the nature of the developmental process. This comparison takes a departure in the knowledge background presented so far, which delineates some main similarities and differences as well as possible interrelatedness between these developmental lines and their theoretical assumptions. As already described, these two theories as well as their inspirational base, Piaget's theory, appear to fulfill high "hard stage" generality claims, seemingly the highest in their research field. This builds the base for the aim of the article, starting in this common feature and consequently raises questions of the generality features besides these "formal" similarities. What is e.g. characterizing the generality of especially these developmental lines besides their "hard stage" feature? Are logical reasoning and meaning making subordinated each other in terms of generality and if so, how and why is that the case? Are they interrelated in the development process and if so, how could this process be understood?

Overriding differences may concern for instance the stressing of different parts of the dialectical movement of the developmental process. If development can be seen as interplay between the polarities of differentiation and integration, it could be said that the MHC axioms emphasize the integration aspect of development, while the differentiation is seen as a necessary part of the transition process. SOT tends to emphasize the differentiation part by describing conflicts and challenges threatening a given subject-object balance. A more obvious difference between SOT and MHC is, as described, the different number of stages/orders proposed in these theories. SOT covers five orders of consciousness and MHC is currently being described with 16 orders of hierarchical complexity (0-15).

How may these differing conceptions of adult development be interrelated? They can be said to investigate different phenomena, and hence be referred to as different developmental lines. This difference has been referred to as the socio-emotional developmental line or dimension which together with epistemic position (King & Kitchener, 1994) constitutes the person's stance that "…determines who I think I am, thus what stance I take in dealing with the social as well as physical world" (Laske 2008, p. 99). Meanwhile, the cognitive development of logic is seen as a tool, although Laske propones the description of a capacity to dialectical thinking instead of complex logical thinking, as described by MHC. According to Laske, this tool determines "what cognitive techniques and models I am able to use in construction and acting upon the world, as a result of holding a particular stance" (Laske 2008, p. 99). The two developmental dimensions are seen as separate but mutually linked in a dialectical relationship.

The embeddedness of logical reasoning in a meaning making context can be theoretically argued for following e.g. Piaget's way of reasoning which support the idea that these aspects of human coherence making are interrelated. At the same time the explicit delineating of these aspects in the two differing lines of development elaborated in the MHC and SOT theories provide arguments for regarding them as being distinctively different. We do neither exclude these interpretations per se, nor the conceiving of them as interrelated one way or another in the developmental process. The latter stand point rather appears as a reasonable presumption behind our comparing approach.

However, our approach is to examine "the logic in the meaning process" rather than examine "the meaning in the logic process." Performing the comparison the other way around could be argued for as a legitimate way to examine this interrelatedness conceiving logic in a wider perspective of coherence making or "comprehensibility" (Antonowsky, 1987) or by regarding logic reasoning as a "causal" necessary condition for the meaning making aspect to be manifested. However, our departure in the SOT process is motivated by our way of approaching meaning making and logical reasoning theoretically. This seems reasonable from a constructivistic perspective on the development and justified by their bases in Piaget's more integrative frame of reference and e.g. Laske's theoretical position (2008, p. 99) conceiving logic reasoning and meaning making as interrelated or interlinked. Both these aspects of coherence describe general aspects of people's coping with the challenges of life as a whole that reasonably can be assumed to have something in common.

However our taking the departure in the meaning making process and not in the logical reasoning process is also motivated by the compared theories' scientific positions. When the SOT and MHC developmental lines were differentiated in two contrasting directions from Piaget's theory, this made the starting point in SOT not only reasonable but almost necessary. The possible interrelatedness between the two aspects could hardly be discerned in a fruitful way by taking the departure in the restricted behaviouristic "outside" MHC perspective, but would reasonable be more worthwhile taking the departure from the inside constructivistic perspective of the SOT meaning making perspective. A consequence of this is that the logical reasoning aspect is restricted somewhat on beforehand to be regarded as a kind of ”tool” to judge for instance logically derived consequences of the self-other coordination in terms of their desirability. However, this does not exclude a possible interpretation that logical reasoning can for instance constitute necessary conditions for the SOT development to occur. The MHC development of logical reasoning is regarded as a process in its own respect that can be assumed to develop independently from the meaning making of SOT, although both processes still being assumed to be interlinked.

A Comparing “Thought Experiment”

Below a comparison is performed by systematically interlinking logical reasoning according to MHC to meaning making according to SOT. As outlined above, our way of approaching these questions takes a departure in the SOT meaning making process to examine how logical reasoning according to MHC might be related to three SOT stages, transitions and transformations. The comparison is restricted by certain assumptions. These are derived from the theories compared and some further theoretical articulations of them. On the base of these assumptions an examination in systematic steps will be performed elucidating in general terms how meaning making and logical reasoning may be progressively interrelated across three SOT stages.

The character of this examination seems to express some features associated with “thought experiments.” This wide ranging concept includes many approaches (Stanford Encyclopedia of Philosophy, 2014). However, a common feature seems to be that they can be “…distinguished from e.g. counterfactual reasoning in general as they seem to require an experimental element, which seems to explain the impression that something is experienced” (Stanford Encyclopedia of Philosophy, 2014, p. 1). Thus it should be something experimental about them in this respect, for instance in terms of extreme implications of imagined scenarios in order to challenge or confirm theories or solve theoretical disputes. The “experimental” feature in our approach is, as described, about examine or testing theoretical implications by an interlinking comparison restricted by certain preconditions (the “experimental” element). Even if these preconditions might not constitute what we associate directly with “imaginary scenarios” they state assumptions about and beyond the compared theories and moreover how these can be examined. Thus, this approach seems to have a thought experimental character that distinguishes it from comparisons in a wider sense. Therefore it is entitled thought experiment. Conceived in such a way our approach cannot be claimed to generate “truths” or empirical evidence. The validity of the conclusions that can be made might concern the legitimacy of the assumptions made, the rationality of how to apply those assumptions and carry through the examination performed as well as what conclusions that can be drawn from it. Rational conclusions from this type of examination might in best case concern new theoretical perspectives or angles to be taking into account in the research field and new assumptions or hypotheses to be considered and tested.

The Piagetian Framework: A Departure

As already described, Kegan’s description of “the Piagetian framework” guiding his own thinking includes three basic interwoven aspects (Kegan 1982, p. 294):

- A biological aspect, reflecting the essence of adaptation, the relating of organism to environment
- A psychological aspect, reflecting the essence of ego, the relating of self to others
- A philosophical aspect, reflecting the essence of truth, the relating of subject to object.

Taken together, these are conceived as different perspectives on the single process of meaning-constitutive development. The *biological aspect* concerns the evolutionary roots of human development as of an interactive character. This is forming basic preconditions for human thinking in terms of acting and interacting with environmental conditions, physical as well as social, in the struggle for survival. The *psychological aspect* concerns the psycho-social and identity base of the self as necessarily relating to others. This indissolvable relation has to be coordinated one way or another to solve for instance internal identity conflicts or master external demands. The *philosophical aspect* concerns the fundamental developmental character in terms of subject-object transformations as “coherence wholenesses.” As described, the stage structures are regarded as being transformed from being a non reflected subject, intuitively guiding a person’s actions and thinking, towards being reflected upon as an object.

The psychological aspect, the relating of self to others is regarded as reflecting the essence of ego, is taken as a central position in the thought experiment performed below. This is justified by the fact that SOT basically takes an inside theoretical perspective in terms of a person’s emotions, thoughts and action orientation in the developmental process. At the same time the relating of self to other(s) is imbedded in the adaptation process between man and environment that reflect a broader action-interaction perspective, including also the physical environment. Both the psychological self-other aspects and the adaptive man-environment aspects, in turn, involve the subject-object coordination as a philosophical-existential aspect of the process. Thus, the ego in the thought experiment concern people’s self-other coordinations hampering or promoting their subject-object transformations in the ego’s interaction with the environment. Thus, the aspect of self-relating to other in this Piagatian framework is conceived as not being limited to an isolated psychological-social dimension of development. Instead it is understood as being embedded in and reflecting a broader and deeper meaning constructing activity and movement of an acting and interacting ego.

This overriding frame of reference provides a departure for our theoretical way of approaching the SOT process in the “thought experiment.” As described, the SOT process is taken as a starting point for this “experiment” which is a kind of examination or test of how logic reasoning and meaning making is interlinked in this process. This testing examination is restricted by the following assumptions

Assumptions, Big Assumptions and General Stage Assumptions

The *first assumption*, or perhaps rather the way of framing the stage developmental lines compared is in terms of dialectical processes as being more or less dynamic movements between balanced (equilibrated) and imbalanced (disequilibrated) phases in this movement. This can be seen as a way to focus on both stages, structures, a taxonomy aspect and the underlying process, and an ontological aspect, in terms of the interplay between both these structure and process aspects in stage development (e.g. Kegan & Lahey, 1998). This dialectic feature of the developmental process can be traced to Piaget's theory and seen as characterizing both the SOT and MHC developmental processes.

The *second assumption* is that the meaning making stage-wise process in SOT can be expressed in general assumptions regarding a person's perceived self-other relating and coordinating in each stage. Here we take a departure in the Immunity to change concept "Big assumption." As already mentioned, such assumptions are not conceived as we commonly understand the concept of assumptions, as consciously more or less articulated statements of what may characterize events and phenomena. Instead, Big assumptions refer to taken for granted truths like meaning regulating principles (Kegan & Lahey, 2001; Wagner, Kegan, *et al*., 2006; Kegan & Lahey, 2009). Thus, these assumptions are by definition not consciously articulated. Although derived from SOT, our assumption involve a further step of articulating such meaning regulating and taken for granted assumptions in terms of assumed explicit self-other coordinations that we consider as typically characterizing each SOT stage from theoretical considerations. Here the "self-meaning context" is consequently formulated as a person's "action orientation," while the "other-meaning context" concern the collective contexts towards which these actions are oriented, both aspects on increasing stage complexity orders of meaning making. The meaning context includes the increasingly complex motivational drives and directed action structures involved in a person's action orientation. We refer to these self-other aspects as General Stage Assumption (GSA)

The *third assumption is* that such General Stage Assumptions of the self relating to others can be conceived as "dualities." This means that the "self-other poles" are regarded as necessary and mutual part of a process, rather than as a static contradiction of opposing positions (Sánches-Runde & Pettigrew, 2003; see also Sun, 2002). In the Piagetian framework described, the relating of organism to environment, of self to others and subject to object can be seen as indivisible parts of wholenesses. Other examples are differentiation-integration and external-internal. None of the "duality poles" can be properly understood without the other, either as foreground or background. Combined with the first assumption this imply that the self-other meaning context duality is seen as involved in a dialectical movement. They can be characterized as initially being intuitively balanced in the subject's non-reflected position in the balanced phase in a new order of consciousness, but then being increasingly unbalanced and rebalanced when deconstructed and reconstructed in the transitions to higher orders.

The *fourth assumption* is that the self-other duality trigger the ego to master the imbalances between these two meaning contexts generated by e.g. internal conflicts and/or external challenges. The General Stage Assumptions involve both such internal conflicts and external challenges. These bring to the fore conflicts or dilemmas that concern how to take into account both the action orientation of the self-meaning context and the other-meaning context to be able to coordinate them (this being further clarified below). The GSA dilemmas in our examination are chosen to express typical such conflicts at each stage transition. One example is how to combine individual goals with societal demands in an at least partly individualistic way in the socialization process into societal life. This concern balancing e.g. the values and goals of the self meaning context with those of in the other meaning context. According to SOT this involves an internalization step transforming the former subject into a new object.

These four assumptions are supposed to promote:

- The specifying of the multifaceted concept of meaning making in stage development in terms of more precise General Stage Assumptions (GSA) of self-other meaning contexts being coordinated
- The discerning of these coordinations as ”regulating principles” in the deconstruction and reconstruction of the GSA in the stages and their transformations
- The discerning of an ego conceived as an “active agent” coordinating these meaning contexts in balanced- –imbalanced – new balanced phases expressed as a dialectical movement towards higher orders of consciousness
- The discerning of how the MHC complexity orders are related to this self-other coordination as a) enabling the discerning or self other meaning context in increasingly abstract terms and b) providing a logical reasoning “tool” to considering consequences of acting according “the self meaning context” or acting according the “other meaning context” to master dilemmas and meet challenges in the deconstruction and reconstruction of the GSA.

The Assumed Developmental Process Character: Further Clarifications

The GSA suggested below is formulated in terms of a person’s differentiation from an intuitive embeddedness in a certain collective context in the equilibrium orders and integration in a wider collective context by an internalization process in the transitions between these orders. As already described, this transition is formally expressed as totally six qualitative steps from one subject-object balance to another, designated as: X, X(Y), X/Y and Y/X, Y(X), Y (Lahey, *et al.*, 1988). Among these, X and Y refer to a subject-object balance in complete equilibrium. This process express a former balanced structure X being step-wisely deconstructed, the X(Y), and X/Y positions, and reconstructed, the Y/X and Y/X positions.

We consider this as a transitional balance shift between a *“differentiation sequence”* from the embeddedness at a lower order of complexity, with a smaller “self-context” (X(Y) and X/Y) to an *“integration sequence”* (Y/X and Y(X)) towards a higher order of complexity, with a larger “other-context.” This can be expressed as the self-other balance “tipping over” from the X-“differentiation side” to the Y-”integration side.” The stage transformation involves the internalization of the “other-position” as integrated in the “self-position” on a more complex order of consciousness. Internally, this is reflected by the self *internalizing* the “other-position” as consistent with the “position” of one’s own. The notion of position here includes both cognitive and affective orientations, see below. Externally this reflects that the self can orient the new “self position” towards and within a broader and more complex context.

The “tipping over” concern a shift between two “outlooks” that will be formulated in the thought experiment as the GSA at a given stage is being deconstructed and then reconstructed. The coordination of the “outlooks” reflecting the self-part and other-part of the self-other dualism involves both cognitive and affective dilemmas. As described cognitive and affective aspects were conceived by Piaget as inseparably joined in a “functional parallelism” and a similar understanding of the interrelatedness has gained further support from different research fields, such as brain research, (Damasio, 1994; Cohen, 2005) and psychological experiments regarding economic judgments (Kahneman, 2012). The cognitive aspect may concern increasingly articulated and complex goals of actions, such as interests, goals and strategies, related to the two outlooks. The affective aspect may concern increasingly complex motivational "drives," such as needs, values, visions, of the same outlooks. Values, defined as frames of references in judging events in terms of desirability and guidelines for actions provide motives and motivation to act and orient a person's action to social, cultural and societal contexts (e.g. Hagström, 2003; Reed, Turiel, & Brown, 1996). Needs and interests can be seen as less complex such motivational "drives" and action guidelines while visions and strategies express more complex such motivational drives and guidelines. Strategies can for instance compared to single goals be regarded as more overriding plans to fulfill a vision taking into account several steps and sub goals due to occurring events. A vision here concerns a desirable future situation, including e.g. values, affections, and special circumstances.

A way to systematically illustrate this is to conceive values as coordinating two or more needs and goals as coordinating two or more interests; and consequently visions as coordinating two or more values and strategies coordinating two or more goals. The transformations are assumed to involve an internalizing of for instance two or more contrasting values and goals in a higher order within the frame of one vision and one strategy. Values and goals are consequently considered as subordinated the visions and strategies hierarchically, which consequently reflects a lower SOT order of consciousness. This is illustrated in the figure below:

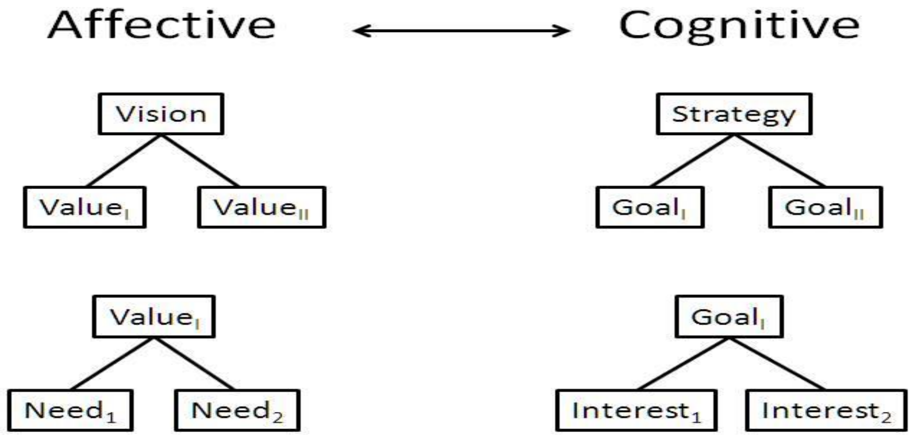

Figure 3. The affective and cognitive aspects of a person's action orientation at different levels of complexity.

Furthermore these affective and cognitive aspects may be assumed being interwoven, possibly as both being more differentiated and integrated on increasing SOT orders as indicated by the arrows in Figure 3 pointing in both directions. Thus the meaning contexts in our examination concerns the increasingly larger and more complex or abstract collective contexts a person can discern and grasp and therefore being involved in by orienting his/her actions by increasingly complex motivational drives and directions of actions. This aspect of the coordination of the self-other meaning context express the ego as an "active agent" trying to reach desirable goals, acting and interacting in the surrounding world. As described, the dilemmas brought to the fore in this process is assumed to constitute general conflicts and challenges typical for each GSA that have to be solved at each SOT transition. The reasoning "tool" in order to master such dilemmas and challenges concern logical reasoning on increasing MHC complexity orders, for instance in terms of formal order if-so causal sequences or in terms of systematic order feedback loops. This appears to express the operative aspect of logic according to Piaget. The logical reasoning involved focuses on desirable or undesirable consequences of acting according the action orientation of a person's self-meaning context and other-meaning context.

Consequently, the coordination of the two outlooks is conceived as involving both these aspects as interwoven in people's action orientation. However, these coordinations are assumed to reflect a relative balance shift between them rather than a total dislocation. Increasingly loosening roots in a smaller self-context is tipping over to more solid roots in a larger other-context. Furthermore, these shifts can be assumed to be initiated by meaning related conflicts within the self-meaning context as well as by meaning related challenges in the other-meaning context. Irrespective of how this process starts and progresses, these shifts are basically considered as expressing a deeper dilemma. It concerns the existential experience of a person not being firmly rooted in either a former self-meaning context or in a potential other-meaning context. This dilemma, regarded as reflecting the dualistic character of the self-other coordination, basically concern how to maintain the continuation of one's identity.

This conception of developmental process can be understood as a shift of the self-other balances in the developmental process including at least three main phases, a) a balanced self-other *"initiating step"* in each new order of consciousness, b) an increasing-decreasing imbalance between the perceived self meaning context and the other meaning context in a *"transition step"* between the earlier self-position (X) and the later other-position (Y) and c) the generation of a *"transformation step"* internalizing the "other-position" as consistent with the position of one's own. This process appear to express a dialectical interplay between the self-positions considered as the thesis's and the "other-positions" as the antithesis's resulting in synthesis's in the transformation step.

The thesis-antithesis feature of the "self-other" positions is here considered as a consequence of their basically existential and identity threatening character as contrasts that have to be coordinated one way or another. Their dualistic "formal-dialectical" features seem to correspond with the MHC transition already described. The "relativistic" position after the thesis-antithesis positions in the MHC transition process is expressed as an either (thesis) or (antithesis) position, which seem to "formally-dialectically" correspond with the SOT transition step distinguishing the self-other dilemma as contrasting "either-or" positions. The SOT process of trying to coordinate these positions, initiating the transformation step may, in turn, share some characteristics with the "smash" step in the MHC transition. In both processes, thesis and antithesis are acknowledged as needed, followed by them being coordinated at a higher complexity order. However, in the thought experiment, the MHC development of logical reasoning is regarded as a process in its own respect that may develop relatively isolated from the SOT development process, although both processes are assumed to be interlinked.

As described, the thought experiment can be considered as a systematic way of comparing these two lines of development, assuming that they reasonably should be interrelated one way another. As also described, this presumption is justified by their basis in Piaget's more integrative frame of logic and meaning being interrelated. The assumption is further justified by the fact that they both describe people's frames of references and coherence in terms of coping with the challenges of life as a whole, which reasonably should involve both logic and meaning.

The Meaning Making in Three Orders of Meaning Making Related to Four Orders of Logical Reasoning

Thus, in order to discern how meaning making is related to logical reasoning, the General Stage Assumptions derived from SOT are judged in terms of MHC complexity orders in three of the SOT stages, the Socialized mind (3rd order), the Self-authoring mind (4th order) and the Self-transforming mind (5th order) and the transitions and transformations between these orders. The thought experiment is briefly performed stage-wisely in the following way:

1. The brief characterization of the subject and object according to SOT in each of the three stages.
2. Formulations of the *"initiating step"* in terms of the subject's General Stage Assumption stated as it's relating of self to other(s) as a non-reflected coordination of this self-other dualism at each stage.
3. Formulations of a *"transition step"* in terms of the self-other dualism being increasingly differentiated when being deconstructed due to a stage typical conflict and being increasingly integrated in a forthcoming "other-meaning" context as reconstructed by the self. Here, the MHC logical aspect is regarded as involved in two respects: First, to enabling the discerning and grasping of the meaning contexts involved in term of their "abstraction levels," and second, as the complexity of the logical reasoning involved to realize consequences related to the contrasting meaning contexts in terms of their desirability.
4. This either-or balancing comparing process is assumed to generate the *"transformation step"* where the former self is being internalized into a new order balance, integrating the former self in a new self at a higher complexity SOT order.

This will be performed in three sections below, starting with the 3rd SOT and the 9th MHC order.

The 3rd Socialized Mind Order and its Transformation

The subject here concerns "the interpersonal mutuality" while the object concern "needs, interests and wishes" (Kegan, 1982). The subject is here initially embedded in "mutually reciprocal one-to one relationships" within a close group relationship(s) context, such as the family or peer group. The subject's intuitive coordination of the relating of self to others may be formulated in the following GSA, reflecting the X equilibrated stage 3rd order of consciousness:

Subject's intuitive frame: "I am my needs and interests of my close group meaning context."

Latent "self-other" duality co-ordination: "I am the needs and interests coordinated with those within my close group meaning context."

The subject's GSA in this balanced self-other *"initiating step"* constitutes what the subject unreflectedly "is." Thus the person's preferences, interests and wishes are perceived as mutually interwoven with those within this person's close group context. The MHC order that constitutes the "minimal" logical capacity to discern and grasp this group context as an abstract context with common features characterizing this context seem to be the No 9 abstract order of hierarchical complexity. As described, this order enables to a person to form abstract variables, such as x and y that don't correspond to single concrete factors or instances in the exterior world. Thus, as already described, variables can be formed out of finite classes that are based on abstract features in terms of quantitative classes (e.g. "always," "everyone") and stereotypes applied to people (e.g. "teacher," "immigrant") as well as imperatives of what one should and should not do. This enables the conceptions of group contexts as characterized by their common needs and interests as uniting their members.

Thus, the meaning constitutive coordination at this third SOT order of consciousness concerns the preferences and interests of the self-part and those of the other-part. Conditions starting the transition step by promoting the *deconstruction* and *reconstructing* of the self-other duality of this GSA may involve conflicts within the close group context as well as dilemmas derived from demands and challenges outside this context, such as conflicting interest between groups that the subject identifies with. The conflict that differentiates the self from its initial embeddedness might concern balancing being caring or selfish, such as feeling selfish when putting one's own preferences and interests before those of other persons' in this context. When experiencing and reflecting about such dilemmas, the self position in the duality can be discernible as a meaning context of one's own, reflecting the differentiation sequence described above. Since groups can be conceived as having something in common beyond their concrete appearance, the self is capable of discerning the possibility of joining other group meaning contexts in terms of possible better solutions of conflicting preferences and interests.

This can be assumed to initiate the integration in a broader social context, due to the self being increasingly capable of open itself the other meaning context. This side of the process concern the integration sequence, also described above. The GSA deconstruction reflected in "I am my own needs and interests *differentiated* from my close group meaning context" and the GSA reconstruction reflected in "I am my needs and interests integrated in a larger social meaning context" can be seen as expressing the different outlooks described above, which reflects the existential dilemma of leaving an identity base, here in the small group meaning context, without being firmly rooted in another identity base in other larger social meaning contexts.

The considerations and reflections when comparing these self-other meaning contexts reasonably involves "if-so" reasoning focusing the possible consequences of acting according preferences and interests in both contexts which therefore may be regarded as a necessary conditions for a further transformation to a higher SOT order to occur. Such way of reasoning does not appear to being possible to perform according the 9th abstract MHC complexity order of logical reasoning. Instead the 10th formal order of hierarchical complexity appears as necessary since it enables cause-effect thinking (if-so, if x then y). Reasoning in these lines reflects the linear process of achieving a goal, or rather with the self-image of already being at that goal. This constitutes for instance young people's cognitive as well as evaluative bases for the assumption of adult roles, life projects and so forth, within a societal context. Thus, logical reasoning of this complexity order makes it possible to relate the preferences and interests of the self-other meaning contexts by logical if-so reasoning, making consequences of the two meaning contexts needs and interests being discernible.

Consequently, such order of reasoning can be assumed to constitute a necessary cognitive tool to consider more or less desirable consequences of both differentiating from a self meaning context and integrating in a new one. The considerations involved here might move the either-or dialectical contrasting transition step over to the transformation step generating a new higher order self, internalizing the former self's preferences and interests in the frame of own values and goals related to the socialization into a societal institutional meaning context. Thus, these values and goals integrate the former needs and interests as subordinated but integrated in the superior necessity to collaborate with others to reach common societal goals regarded as not necessarily conflicting with the small group meaning contexts. The former subject as a "small group self" has become an object being consciously coordinated in a new larger and more complex meaning context on the 4th SOT order.

The 4th Self-authoring Mind Order and its Transformation

The subject here concerns "authorship, identity, psychic administration and ideology" and the object "the interpersonal mutuality" (Kegan, 1982). The subject is initially embedded in an institutional-societal context. Its intuitive coordination of the relating of self to others may be formulated in the following GSA reflecting the X equilibrated stage 4th order of consciousness:

Subject's intuitive frame: "I am my values and goals of my institutional-societal meaning context."

Latent "self-other" duality co-ordination: "I am my values and goals coordinated with those of my institutional-societal meaning context."

The subject's GSA in this balanced self-other initiating step is assumed to constitute what the subject unreflectedly "is" in terms of its values and goals. The MHC complexity that appears to constitute the "minimal" capacity required to discern and grasp the "abstraction level" associated with an institutional-societal meaning context appear to be the 10th formal order. The self-context at this order can be understood as the goal oriented "system" acting and interacting within a non reflected collective-societal context. The self context has consequently been transformed to the "self-system" of an ego capable of moving beyond the close group context, subordinating affective needs and cognitive interests in the frame of own values, goals, actions and interactions. However, the former close group context is still perceived as remaining intact to return to. Joining broader social contexts is promoted by for instance going to college or to temporary jobs which provide "…opportunities for provisional identity which both leave the interpersonal context behind and preserve it, intact for return; a time limited participation in institutional life" (Kegan, 1982, p. 165).

The meaning constitutive coordination at this order of consciousness concerns the values and goals of the self-part and those of the other-part. The transition step is regarded as being promoted by the deconstruction and reconstructing of the self-other regulating elements of this GSA, which here concerns conflicts within the societal-institutional meaning context, as well as challenges outside or beyond this societal-institutional context. The conflict that differentiates the self from its initial embeddednes might concern doubts about the self's identification with the common institutional societal norms and values as constituting the ideal or role as being a pillar of society. This could be clarified through the insight of there being a gap between reality and ideology, between the self and an ideal, or between the self and society. Experiencing such stage typical conflicts initiates the differentiation sequence part of the process. This is followed by the integration sequence where other possible collective meaning contexts are discerned as framing e.g. ideological action guidelines to reach better solutions of the typical conflicts at this order than those provided by the traditional societal-institutional context. It reflects the ego being more capable to opening itself to a self chosen ideological position.

The considerations and reflections about these conflicting self-other contexts in this SOT transition can be assumed to necessarily involve the hypothetical consequences of the self-system acting in for instance other systems, contexts and cultures for the triggering of a transformation to a higher SOT order. Such way of reasoning does not appear as being possible to perform according the 10th formal MHC order. Instead, the 11th systematic order of hierarchical complexity reasoning seems to be adequate. As described this order enables logical reasoning about how a change in one element (X) leads to a corresponding change in another element (Y). Mathematically this corresponds with the construction of multivariable functions. When reasoning about hypothetical consequences of actions this kind of reasoning enables to consider differing consequences of different systems and "situate events and ideas in a larger context, i.e. considers relationships in contexts; form or conceive systems out of relations: legal, societal, corporate, economic, national" (Commons, Ross, & Miller, 2010: 6). The systematic order of reasoning enables the creation of a coherent system, such as a feedback loop: "An increased level of carbon dioxide leads to global warming which leads to an even higher level of carbon dioxide, and so forth."

Thus, the logical tool here enables reasoning in terms of possible feedback loops and "spiral processes" of the more or less desirable consequences acting in accordance with institutional and ideological values and goals. In the transformation step here the values and goals of the former self context is being internalized as subordinated in the frame of visions and strategies related to new societal discourses and meaning making. The former subject as "a societal-institutional self-meaning context" has become an object to consciously coordinate in a new, larger and more symbolic complex meaning context on the 5th SOT order.

The 5th Self-transforming Mind Order

The subject here concerns "interidividuality, interpenetrability of self systems" and the object "authorship, identity, physic administration, ideology" (Kegan, 1982). This has resulted in a new balance at a higher order, formulated as the GSA regarding the relating of self to others, reflecting the X equilibrated stage 5th order of consciousness:

Subject's intuitive frame: "I am my visions and strategies of my ideological-collective meaning context."

Latent “self-other” duality co-ordination: “I am my visions and strategies coordinated with those of my ideological-collective meaning context.”

The subject’s GSA initially in balance in the initiating step at this order implies that the person’s visions and strategies is perceived as mutually interwoven with those of the ideological-collective context. The MHC order that seems to constitute the minimal capacity required to discern and grasp the abstraction level associated with this ideological-collective context seem to be the 11th systematic order. The self-meaning context has consequently been transformed to a self capable of moving beyond the societal-institutional meaning context, subordinating this context within the frame of one’s own visions and strategies. Thus, the meaning constitutive coordination at this SOT order concern the visions and strategies of the “self-part” and those of the “other-part.” The “*transition step”* here involving the *deconstruction* and *reconstructing* of the self-other regulating might concern doubts about the self’s identification with its collective-ideological visions and strategies. Comparing reflections might for instance be about, on one hand, there might be too much collective disadvantages for maintaining the individual’s freedom in a market economy or, on the other hand, there might be too much individual disadvantages, such as lacking freedom to maintain a centrally regulated plan economy.

Experiencing and reflecting about such dilemmas, initiating the differentiation sequence, may result in increasing insight that if the strategy of a certain ideology is adopted by everyone, there will still be a lot of losers. The integration sequence, might be formulated as an increasing insight of the desirability of an other-meaning context of a larger collective stream of human growth. Thus, the duality positions involved in this transformation can be formulated as “I am my visions and strategies *differentiated* from my ideological-collective context” focusing the self-part of the meaning context duality and “I my visions and strategies *integrated* in human development and growth” focusing the “other meaning context duality. These two meaning contexts appear to be grasped and discernible as “abstractions” on the MHC 11th systematic order of hierarchical complexity. But also here, the transformation towards a higher SOT order seems to involve logical reasoning on a higher MHC order, in this case the 12th order of hierarchical complexity. This logical reasoning “tool” enables the coordination of more than one system. As described, the ego here is regarded as capable to compare or combine coherent systems as well as being able to compare these with reality by analyzing discrepancies and discern interactions between them. The transformation step and internalization process here results in a more complex balance where the hallmark can be understood as an emphasis on development and growth where the self-other distinction is being less articulated and the boundary between them has been loosen. Thus, it is the growth of human beings rather than the growth of scientific knowledge and economic or material growth that is meant.

This description of the fifth SOT order of consciousness involves both the initiating step and the transition step towards a hypothetical more complex SOT order. It is being characterized as being a dialectical and trans- or post ideological one, involving the capacity of dealing with paradoxes, contradictions and oppositeness. This seems to reflect a dialectical way of thinking, elaborated by Basseches (1984) and Laske (2008), implying patterns discernible as changing wholenesses rather than accumulations of fixed truths. The relating of self to others may concern the capacity to embody multiple ideologies and many coherent systems of personalities and still being able to continue the process of self-actualization and transformation. The “self” here thus seem to concern the subject as an ongoing, evolving and transforming movement while "others" here concern an interwoven such a collective movement of interrelated societal and cultural patterns. However such a self-other balance is in our examination seems to be generated rather at a hypothetical 6th order SOT balance than characterizing the 5th order balance. This seemingly confusion of what constitutes the 5th SOT order of consciousness can be interpreted in the frame of a more general confusion of the conception of stages as structures or process which will be further discussed in the following discussion section. The result of the comparing "thought experiment" can is illustrated in Table 3 below:

Table 3. Meaning making and logic reasoning in three consciousness orders and transitions.

SOT meaning making order and transitions	*MHC logical structures and reasoning involved*	*Subject: Self-other General Stage Assumptions deconstructed and reconstructed*	*The internalization process*	*Object: Self-other regulation internalized in higher orders*
3rd order, Socialized mind	**9 abstract order**: Concrete elements form abstract variables (e.g. X, Y), e.g. categories such as time, place, everyone, teacher **10 formal order latent**	"I am my needs and interests of my close group meaning context"		
3/4-transition	**10 formal elements and operations involved**: Abstract variables e.g. cause and effect relationships (if X then Y), "An increased amount of carbon dioxide in the atmosphere leads to global warming"	**Self:** "I am my needs and interests differentiated from my close group meaning context" **Other**: "I am my needs and interests integrated in a larger social meaning context"	Differentiation-Integration sequences Lower order self X being internalized in higher order self Y X(Y) X/Y – Y/X, Y(X)	
4th order, Self-authoring mind	**10 formal order** **11 systematic order latent**	"I am my values and goals of my institutional -societal meaning context"		"I am my needs and interests etc. of my close group meaning context"
4/5 transition	**11 systematic elements and operations involved**: Formal relations coordinated; functions, equations with more than one variable, feedback loops: "Increased levels	**Self**: "I am my values and goals differentiated from my institutional –societal meaning context" **Other**: "I am my values and goal	Differentiation-Integration sequences Lower order self X being internalized in higher order self Y	

	of carbon dioxide leads to global warming which leads to even higher level of carbon dioxide etc.”	integrated in a larger collective-ideological meaning context”	X(Y), X/Y – Y/X, Y(X)	
5th order, Self-transforming mind	**11 systematic** **12 metasystematic order latent** (e.g. combining and comparing systems)	“I am my visions and strategies of my ideological-collective meaning context		“I am my values and goals of of my institutional – societal meaning context”

The Self-transforming order of consciousness exceeds the highest of Piaget’s stages. It seems reasonable that this characterized Piaget’s own way of thinking since he considered an individual as a self-transforming system who creates new structures during the course of development in interaction with the surrounding world. This process and its driving forces (such as accommodation, assimilation, equilibration, and transformation) are described differently than the description of formal logical operations (such as equivalence, mutual implications, and negations). However, Piaget did not seem to claim that cognitive development ends with formal operations. He rather seem to have meant that these operations constitute the final form of equilibrium, in terms of coordinating the groupings that earlier have not been coordinated in a single system (Lourenco & Machade, 1996).

This way of coordinating was not considered as changing during adult life, but it was understood as possible to integrate into larger systems. The “elements” that are being coordinated consists of increasingly abstractly defined categories. According to Piaget they would not be logically more complex. But according to MHC they would be more complex in terms of the abstraction levels of the coordinated elements and according to SOT more complex in terms of interrelated meaning categories. Cook-Greuter (1999) claims that the conceptions of what follows beyond formal operations can be divided into two trends. One of these conceive the further development as an ongoing differentiation and integration process towards more mental flexibility, the other conceiving development as a step-wise deconstruction of subject-object boundaries. The former trend may be compatible with logic in the frame of complexity theory and non-linear mathematics, while the latter trend rather may concern a phenomenological understanding and ideas from quantum physics. The concepts of postformal and dialectical thinking have been criticized as lacking theoretical clarity and that the notion of “integrative thinking” therefore should be used instead, referring to both additive and transformative process characteristics (Kallio, 2011). Here further research and theorizing is required.

Concluding Summary

On the base of the “examination” performed across the three SOT orders restricted by the assumption and clarifications described, the following conclusions seem to be reasonable:

1. The assumptions and clarifications seem to make the SOT and MHC discernible as distinct diverse structures derived from Piaget’s perspective of those structures considered as more

implicitly interwoven. This concerns not at least the understanding of the SOT meaning making as self-other coordinations of duality elements being contextualized as self-other meaning contexts expressed in terms of the General Stage Assumption stated.

2. Further, these assumptions and clarifications appear to make the ego in these coordinations discernible as an "active agent" driven by increasingly complex motivational drives and corresponding increasingly complex goal orientations, being increasingly able to act and be involved in more complex external contexts.
3. The testing "examination" across the three initiating, transition and transformation steps appear to make the SOT process discernible from a psychological inside perspective regarded as a person's way of contextualizing his/her conflicts and challenges in terms of self-other meaning contexts being experienced as balance disturbing conflicts and challenges.
4. The testing "examination" also seems to make the logical reasoning and meaning making aspects discernible as structurally and functionally interrelated in the development process. Logical complexity according to MHC appears as a condition to cognitively grasp the "self-other" meaning context categories as necessary but not sufficient condition to be able to coordinate these. Further, the logical reasoning that appear as a necessary condition to trigger the transformation step seem to be at least one complexity order over the MHC order necessary for initiating the transition step at each SOT order.
5. Thus, these conclusive suggestions of the interrelatedness of logical reasoning and meaning making, although conceiving each of them as distinct differing lines of development in their own respect, still suggest them as being necessarily interlinked in the SOT meaning making process.
6. The generality claims of both models might be argued for without one of them being regarded as necessarily subordinated the other one. However, such a conclusion brings to the fore further considerations of what constitutes their generality claims beyond their "hard stage" characteristics. This concern e.g. their content, functions, causal relatedness and mutual embeddeness.
7. Taken together these outcomes from the thought experiment and interpretation of them bring to the fore a seemingly need for a shift from a focus on the development stage classification to a focus on the underlying developmental process in constructive development stage theory and research, although still take into account the structure and process dynamic as a wholeness. The process focus involves the inside-out as well as the outside-in conditions influencing development. A focus shift towards the underlying process dynamics that inter-relate stages, transitions and transformations will promote a "contextualization" lens on constructive-development stage theory and research.

Discussion

The aim of this article is to discern general features in adult development stage structures and transitions in terms of logical reasoning and meaning making. By way of introduction it should be underlined again that the conclusions that can be drawn on the base of the thought experiment cannot be claimed to provide "truths" or empirical evidence, but in best case theoretical insights and fruitful hypotheses triggering the discussion in the field a bit forward. The following final considerations aim at elaborating more in depth and breadth on the issues brought to the fore by our comparing approach and the summarized conclusions made. *First*, the relevance of different generality claims will be discussed in terms of two approaches. *Second*, this raises questions about the differing subjectivistic and objectivistic "scientific positions" of SOT and MHC that will be considered and again related to their inspiration source, Piaget's theory. *Third*, this leads to taking into account both inside-out and outside-in development influences when considering the distinctions between stages, transformations and transitions. *Fourth*, it is argued for the need to contextualize individuals' developmental possibilities in for instance the frame of a "transform-actional approach" to meet postindustrial demands and challenges.

Generality: Causal Sequences, Existential Depth and/or Mutually Interlinked Processes?

To summarize, generality in development stage theories has commonly been related to strong development criteria and hard stages, typically Piaget's theory of logic development, such as universality, fixed sequentiality, irreversibility and qualitativeness leaps. Piaget's understanding of logic as interwoven with meaning implications implies both these aspects as constituting general features of the stage developmental process. However, he did not explicitly clarify how these aspects were interrelated in this process. As a way to clarify this further, logical reasoning according to MHC and meaning making according to SOT was compared in terms of the assumptions and conditions related to a thought experiment. The fact that each of these neo-Piagetian theories was an advocate of high "hard stage" generality claims and at the same time focused on either of these aspects justified the choice of comparing their approaches. The questions concern, as described, if, how and why they are, hierarchically and/or causally subordinated in generality terms, and/or interrelated in the development process.

One way of judging this can be expressed as the "the causal-sequential approach." This concern sequential links between domains in terms of necessary and sufficient conditions for development (e.g. Pintrich, 2002; Colby, Kohlberg, *et al*. 1987). Advocates of this position may for instance argue that "…the operations in question will necessary be exhibited first in the response to logicomathematial or physical problems, next in response to social problems, and last in response to moral problems" (Colby, Kohlberg, *et al*. 1987, p. 13). According to these authors, such a scientific position has gained a substantial empirical support. An at least implicit assumption here seem to be that necessary structures are more basic and thus more general in that respect. A radical such a position is to consider other domains as direct manifestations of such basic ones. Following this line of reasoning may end up in distinctions of a "hen-egg" type, reflecting an "evolutionary" perspective and biological explanations. The "causal-sequential approach" may imply that the "formal" character involved in logical reasoning "translated" to and manifested in other domains constitute the underlying driving forces in stage development. Thus, the "hard stage" character of other domains is assumed to indirectly reflect the "strong" development necessity drives related to for instance axiomatic logic premises which concern the "formal" structural and dialectical aspects of development.

Another way of judging generality can be expressed as *"the existential depth approach."* This approach is related to the content and functions of development stages and its transformations. This wholeness express a both broader and deeper meaning of the self-other coordination, reflected in its dualistic character of something that has to be coordinated one way or another. The self-other coordination reflect, according to the "Piagetian framework" the essence of ego, acting and interacting in an environment (the biological aspect) reflecting the essence of adaption and coordinating subject and object (the philosophical aspect) reflecting the essence of truth. Thus, the wholeness of this process involves both a *broader* and *deeper* conception of the self-other coordination than being limited to strictly social aspects. The process should rather be conceived as an evolving ego as essentially being a meaning constituting movement and activity**.**

Therefore, the existential depth of a SOT "self-other" coordination might be understood either as one of a person's many functions or rather as a central and holistic tendency in a person's organizing of meaning. SOT take this latter position and claims that this perspective "…is the very ground of personality itself - it *is* the person" and "…where 'person' is understood to refer as much to an activity as to a thing" (p. 3 and 7/8 respectively, Kegan, 1982). Ego here refers to a central organizing tendency and as the activity of meaning making towards more complex structures. It can be conceived as underlying other forms of cognitive, physical or social coherence structures including those focusing the self-other coordination in more delimiting respects such as Kohlberg (1987), Selman (1980) and Skoe (2014). The conception of ego in terms of an underlying form or process can be expressed as an "epistemological structure": "…what we know about our way of knowing" where "the subject-object relationship forms the cognate or core of an epistemology" (Kegan, 1982, p. 53). Thus, the reduction of the SOT development process that appears to be the consequence of focusing on the self-other coordination is not to be regarded as trivializing this theoretical approach in any way. As hopefully has been clarified, the self-other coordination is not restricted to taking others' perspectives in social interactions or being understood only as individuals joining increasingly larger collective categories. As described, it rather concerns how these self-other categories, conceived as meaning contexts, are coordinated by a person's actions (motivationally and directionally) on increasingly complex orders using increasingly complex logical "tools."

A conclusion of these lines of reasoning seems to be that logical reasoning may be regarded as more general than meaning making according to *"the causal-sequential approach,"* and meaning making as more general than logical reasoning according *"the existential depth approach."* At the same time the thought experiment indicates that the SOT and MHC complexity defined in their own terms correspond with each other stage wisely even if the number of proposed stages differs. This reflects that the MHC stages were found being involved in the differentiation-integration "positioning" in the transitions between the SOT stages. Increasing meaning making complexity seemed to be promoted by correspondingly increasingly logical reasoning complexity in the deconstruction and reconstruction of the self-other dualities. In this way logical reasoning can be said to constitute a necessary but not sufficient condition for development of meaning making, being more general in this respect. At the same time, meaning making can be understood as more general due to its embedding of this logical capacity as a subordinated "tool" in this more identity constituting developmental process. As already stated, a main conclusion from the thought experiment is therefore not that one of the aspects is subordinated the other one in a more absolute sense. The conclusion rather is that both aspects are necessarily interrelated in human development, and at the same time seem to constitute diverse generality high and maybe essential features in their own respects.

However, this raises further issues about how logical reasoning is related to meaning making. The hard stage character of MHC refers, as described, to its hierarchical principles and axiomatic operating logical principles. These stipulate necessary conditions for transformations of logical reasoning to occur. The qualitative leaps are due to new ways of solve logical problems. The correct solutions define the stage levels and this is regarded as theoretically reflecting both functional and structural aspects: “The functionalism is that stages are based on performance of tasks. The structuralist part is that sequences that are generated using the MHC are ordinal structures. Each order is qualitatively different and irreducible to any of the lower orders” (Commons, Ross, & Miller, 2010, pp. 10ff.). The generality claims of both the SOT and the MHC theories concern their dialectical thesis-antithesis-synthesis character. However, the interrelatedness of these two processes in “real life contexts” may not necessarily seem to imply the competence of logical reasoning in a strictly mathematical respect. The MHC functionalism based of the performance of tasks reflects a connection between logical operations and actions in terms of internal action sequences being logically coordinated to reach external goals. Logical reasoning is thus regarded as generating actions but action coordination may also, the other way around, generate logical reasoning. Action coordination in this sense does not necessarily seem to require being sequentially preceded by the axiomatic-mathematical operations. Thus, logical reasoning in pure axiomatic-mathematical terms might not be either a necessary or sufficient condition for meaning making, even if logic in verbally reasoning terms seems to be necessarily involved. “Semantic” logical reasoning may also be at hand before its strictly mathematical manifestations have developed. This tentative conclusion would at least constitute a hypothesis to be tested. The necessary conditions for the meaning making development process to occur using the necessary logical “tool” may, in turn, require demands and challenges in the external context to be triggered.

Differing “Scientific Positions”

The SOT understanding of the self relating to others partly appear to express the distinction made by one of his inspiration sources, George Herbert Mead, between “I” and “me” as mutually related in a dialectic wholeness as constituting the ego (Mead, 1934/1967). “I” reflect the here and now acting ego, while “me” concern ego’s conception of his/hers social roles. “I” seem to concern the non-reflected actions of the ego that resembles the SOT conception of the “subject” in a balanced phase of a consciousness order, while “me” can be related to reflecting on these actions and their social consequences, resembling the SOT conception of the “object.” Mead’s ego conception reflects a social behaviorist perspective of ego, a perspective differing from neo-Freudian psychology ego conceptions (see Kegan, 1982). This brings to the fore not only the differing philosophical inspirational sources behind the compared theories but also the implications of their differing “scientific positions.”

The self-other meaning context coordination involved in SOT can be conceived not only as an epistemological but also an ontologically matter: “…what is at stake in preserving any given balance is the ultimate question of whether the “self” shall continue to *be*, a naturally *onto*logical matter” (Kegan, 1982, p. 12). These epistemological and ontological aspects of the SOT self-other coordination seem to justify its generality claims as of a basic character in its own respect. This can be concluded also regarding the axiomatically-mathematically defined MHC process. However, the SOT process clearly focuses on development from the inside while MHC focuses it from the outside. The epistemological and ontological character of the SOT self-other coordination concern universal “inside” aspects such as “…what it means for us that our world designs cohere and fall apart; to crisis, anxiety, the defenses, all newly understood; to the uses of pain, to meaningfulness and meaninglessness, breakdown and breakthrough, to the very movement of meaning" (Kegan, 1982, pp. 12ff.).

How are these inside and outside positions related to each other in a more overriding "scientific-theoretical" perspective? As described, the hierarchical and dialectical change characteristics of SOT and MHC can be traced to Piaget's theory. The idea that higher structures integrating lower ones in a centering-decentering process in Piaget's theory seems to correspond to the subject-object dialectic in SOT and it also seems to be possible to conceive the MHC transformations in these terms. The differences concern the constructivistic character of Piaget's theory and SOT that is not found in MHC behaviouristic approach. Constructivism refer to the subjective process of constructing, deconstructing and reconstructing a given stage structure. This difference between the theories can, in turn, be related to epistemological and paradigmatic issues. Beside the content difference, these differences also concern the investigating of the study object from inside or outside and using quantitative or qualitative data approaches, as mention in the introduction**.**

As already mentioned, focusing the study object from the outside, using quantitative data and formal aspects can for instance be associated with an "objectivistic" paradigmatic position to science related mainly to criteria from the natural sciences and positivism. Focusing the study object mainly from the inside, using qualitative data and preferring content aspects tend to be related to a "subjectivist" paradigmatic scientific position with criteria emanating from social sciences and the humanities (see e.g. Cohen, Manion, & Morrisson, 2000). The scientific position of Piaget seems to constitute a mixture of these focuses. This seem to reflect his background in the natural sciences (biology) and his "in-between" position in linking logic and meaning to create a "psycho-logic," as outlined above.

Piaget focused on logical reasoning from the inside and regarded that as a legitimate study objects. But he also studied the investigated object from the outside, and took into account social aspects. However, a social factor, he argued "… is a fact to be explained, not a fact to be invoked only as an explanatory factor" (Piaget 1946/1976b, p. 10). This constructivistic "meaning link" reflect an "inside perspective" and a "subjectivistic" paradigmatic position. At the same time he formalizes the logic in mathematical terms and underlined the form or formal aspects of the developmental process. This is mainly related to the "objectivistic" position, as well as his use of "behavioral" criteria judging children's solving of cognitive-logical issues in experimental designs. Thus, he was not clearly restricted to either of these two paradigmatic positions but rather took a more flexible standpoint.

The differing paths from Piaget taken by SOT and MHC concern the latter as focusing on the study object from the outside by means of applying a mathematical approach and SOT focusing on the study object from the inside using a qualitative approach. The MHC limitation of logic to its axiomatic mathematical aspects follows Aristotle's codifying of logical reasoning that states that inference logic axioms and logical arguments starting with postulates (Commons, Ross, Miller, et al., 2009). MHC focuses on behavior outcomes and requires at least two independent "paths" of a mathematical-logical, phenomenological and empirical "ways of knowing."

Behaviorism concerns broadly the confirming of hypotheses of psychological phenomena in terms of behavioral criteria, thus demanding behavioral evidence for such hypothesis. This seems to correspond with the MHC position in this respect. A strictly behavioristic position can be said to understand behavior as caused by external conditions and furthermore, that mental terms in explaining behavior should be eliminated and replaced by behavioral concepts. A strong behavioristic position rejects the conception of human free will (Skinner, 1971). But even if the MHC position is not that extreme since it allows "events" beyond behavioral ones, covering emotions and attitudes to be included as constructs to be studied indirectly (Commons, 2001), it takes a rather different scientific standpoint compared with SOT. The latter approach primarily focus on the mental stages of meaning making as legitimate study objects. The study of mental structures as general organizing principles in the SOT frame of reference focuses, as described**,** on their underlying meaning consistency. Following Colby, Kohlberg and colleagues way of reasoning about this (1987), "… to achieve this understanding, one must adopt the subject's point of view and grasp the sense the argument make to that person" (p. 3). In this way the structuralism approach can be considered as related to phenomenalism.

SOT, referring to traditional scientific criteria in social sciences (construct validity, statistical reliability etc.), provides knowledge from the "inside" subjectivist position, which makes it necessary to understand the content of meaning making as a wholeness. MHC contributes with e.g. an "outside" objectivistic analytical stringent tool to discern the "mathematical-logical" structure involved in "hard stage" structures and transformations (in terms of one-dimensionality according to Rasch mathematics, see e.g. Bond & Fox, 2007)**.** Instead of regarding for instance epistemological assumptions as necessarily embedded in basically conflicting paradigms, they could rather be conceived as compatible in providing "hard" and "soft" data and strengthening empirical findings, such as by means of triangulations (Bryman, 2004).

The constructivistic characteristic of Piaget's theory and SOT bring to the fore the relation between logic and action with implications for how to conceive causal mechanisms in development, from the inside-out or outside-in directions. Following Piaget's thinking, logic is not isolated from life. It rather reflects the operational co-ordinations that are substantial to action (Inhelder & Piaget, 1958). Inside-out aspects concern inner "drives" to reach logical consistency as well as create meaning consistency. Both processes seem to reflect the constructivist character of the developmental process of acting and interacting persons in a societal context trying to reach meaningful goals and solve problems when doing so. This process is also more or less promoted or restricted by external demands and challenges.

Stage Transitions and Transformations

As described, our perspective on stage structures and their transitions in the thought experiment was framing them as dialectical more or less dynamic movements between balanced (equilibrated) and imbalanced (disequilibrated) stage structures and their transition phases in this movement. As also has been outlined, this framing makes the process more discernible in phases of initial balances, transitions and transformations. Moreover, this movement may concern different kinds of "forms" of coherences being transformed (such as meaning making and logical reasoning). Taken together these presumptions result in stage-transition distinctions than differ compared with those generated from "taxonomy approaches" derived mainly from stage structure criteria. Our two presumptions enabled a clarified suggestion of how MHC orders are involved in the SOT order transitions. Thus, our interpretation is derived from both the conception of SOT as a constructivist-dialectical process and the conception of the differing but interrelated functions of meaning making and logical reasoning described in the SOT transitions and transformations.

When lacking for instance such constructivistic judgment criteria, the distinctions between stages and transitions become less obvious as well as what characterizes transformations. In the somewhat overlapping theoretically multifaceted field entitled Transformative Learning Theory, focusing adult learning in for instance more applied-contextualized and ideological critical terms, the "formal" constructivistic development line of reasoning is not the central theoretical base. Issues here concern for instance the functions of the transformations and the interrelatedness of individual personal growth and social changes (e.g. Taylor, 2009). However, without clarified conceptions of what is constituting the form of coherence that is developing it becomes harder to judge how such a form is being "trans-formed" (for a discussion, see Mezirow, 2003; Kegan, 2000) and deciding stage-transitions in such terms.

However, as indicated in the introduction, also within "softer" approaches in adult development stage theories focused in this article, the stage-transition conceptions differ compared with the "hard stage approaches." Results obtained using Loevinger's (1976) strictly psychometric inductively based stage model doesn't imply a constructivistic "necessity" rationale driving the transitions between stages. This theoretical position also seem to be related to her suggestion of more stages compared with the number stated by SOT, including stages that correspond roughly with the transitions in SOT**.** The conceptions of stages and transitions have changed in this model since the self-aware and the individualist stages in this model first were considered to be merely transitions between the conformist and conscientious stage, and between the conscientious and autonomous stages, respectively. But suggestions of new stages and transitions have been common also within the frame of more constructivist models. Adding a new stage or a new order to a stage theory occurred more than once during the development of MHC in the 80s (Commons & Ross, 2008) and just recently (Ross, Commons, Li, Stålne & Barker, 2014).

Cook-Greuter (1999), highly inspired by both SOT and Loevinger's theories, conceive stages and its transitions as dialectical forms of knowing that integrate affect, intuition and rational thought. This results in an understanding of transitions in the SOT as stages in her own model. Stages are here characterized by persons' alternating between differentiated and integrated ego positions regarded as "…organic wholes, as relatively stable balances within which adults stay settled for long periods of time, often for a life time" (Cook-Greuter, 1999, p. 53). In total ten stages are proposed that reflect stages of differentiation exchanged by stages of integration. The integrated stages here are regarded as more balanced than the differentiated stages. The latter ones seem to correspond with transformational positions in SOT and the integrated stages correspond with the stages in SOT.

In a way Cook-Greuter's model can be said to take a position between MHC and SOT but implying less generality claims regarding the universality of the stage structures and its transitions. But Kegan, in his first conception of the stages (1982), also conceived them as either favoring independence or inclusion. Later (1994) he found that he thereby confused "style" with "structure. He concluded that such increasing differentiation or increasing autonomy is characterizing everyone's development, but claimed that increasing differentiation in itself can be conceived as staying connected in a new way. Increasing autonomy therefore does not have to be about increasing aloneness, but instead about increased self regulation: "Deciding *for* myself" does not have to equal "deciding *by* myself" (Kegan, 1994, pp. 21ff.). Thus at each stage, connection and separation are regarded as integrated in a wholeness which both can be expressed within the given complexity meaning structure.

The fact that transitions in "hard stage" models are conceived as stages in "softer" stage models seem to reflect the latter models' higher sensitivity for the "outside-in" direction of the developmental process. The fact that the self-aware stage in Loevinger's theory, entitled as "expert" stage in another version (Hy &Loevinger, 1996; Fischer, Rooke, & Torbert, 2003) is conceived as a stage and not a transition may be understood as a consequence of organizational and societal demands on people in modern society. At this "stage" persons tend to follow formally stated rules and regulations and administrative operations common in traditional hierarchical organizations that may hinder further individual development also when applying decentralized organizational forms (e.g. Göransson, Hagström & Backström, 2011; Hagström, Backström & Göransson, 2009). Moreover, the increasing demands in post industrial society of flexible functioning individuals and decentralized organizations may have stabilized a seemingly increasing frequency of persons at the individualist stage, also conceived as a transition in SOT. This is especially apparent among highly educated people characterized by a relativistic or even nihilistic frame of reference, also referred to as a deconstructive postmodern way of thinking.

Consequently, the definition of stages and transitions is related to "hard-softness" criteria. Softer criteria are more sensitive to contemporary social-cultural-societal conditions that for instance hinder hard stage development. This brings to the fore issues of how cognitive logical structures are related to the functioning of the individual in a given context or domain. These structures may, although they may trigger logical thinking inside-out, not necessarily directly lead to functional behavior. Piaget did not appear to think that the assimilating of the logical structures as the whole meant that they were responsible for all cognitive manifestations of a given stage (Lourenco & Machado, 1996). Logical stage structures as a whole were seen as formal criteria to classify thinking not as "… a sort of super functional totalities that regulate performance" (Lourenco & Machado, 1996, p. 152). Mental processes were focused in their construction and stages were conceived as tentative tools to analyze such processes rather than as ends in themselves.

This way of focusing the construction of logic appears as a plausible way of relating logic to external demands and challenges. Our example in the thought experiment can illustrate this. In the SOT 4th (Self-authoring mind) transition, the MHC 11th systematic order of reasoning is regarded as a logical "tool" enabling to create a coherent system, such as a feedback loop: "An increased level of carbon dioxide leads to global warming which leads to an even higher level of carbon dioxide, etc…." This reflects a capacity to understand formal relationships in different e.g. cultural cultures contexts and within differing ideologies including moral and value based judgments**.** Differing contexts may or may not trigger the application of for instance logical thinking in other different "domains" such as in meaning making and moral judgment. Such a process is not mechanically driven. It involves both inside out and outside-in parts of the development process. Thus, excellent thinkers on very high MHC order of logical complexity in the history of science (see Commons, Ross, & Bressette, 2011) might not correspond with likewise high orders of other developmental domains reflecting personal maturity as indicated in biographies, according to Cook-Greuter (1999).

The Contextualization of Constructivistic Development to Meet Societal Challenges

In the introduction of the article three main theoretical issues related to constructivistic development theory and research were briefly outlined, namely the causal mechanisms involved in terms of inside-out or outside-in direction; the way of approaching these issues as “objectivistic” or “subjectivistic” scientific positions, and; the understanding development as progressing continuously or discontinuously in terms of stages or functions. The scientific positioning issue has already been approached but the other aspects will be somewhat considered. Our thought experimental approach can be regarded as a way of “contextualizing” constructivistic development theory. Focusing on the generality aspects can be regarded as a way to discern core elements involved in the constructivistic process that trigger developmental transformations and our examination seems to support the assumption that logic reasoning and meaning making constitute such core features.

These core elements and their coordination also seem to reflect the motivation to act and the direction of these actions to fulfill demands and meet challenges in external contexts in the direction inside-out. The demands and challenges, in turn, are supposed to influence a person’s acting and trigger his/her development in the direction outside-in. Our General Stage Assumptions can be considered as an ambition to illustrate such general contextual demands and challenges in contemporary societies. The fact that the constructivistic development “hard stage” theories often seem to have been positioned as representing an inside-out intrinsic and even “individualistic” standpoint compared with other outside-in positions, such as the one associated with Vygotsky’s theory, is not surprising. However, it does not necessarily follow by its “constructivistic” characteristics.

The external demands and challenges in a constructivistic developmental frame are not to be considered as mechanically influencing a person’s action orientation regarded as e.g. “causal-independent variables.” As Piaget appeared to reason the outside-in influences are to be explained not as explanatory in themselves, but in terms of them being constructively experienced (Piaget 1946/1976b). However, this constructivist “link” between the inside-out and outside-in influences do not in any way exclude the latter ones as highly influential. Instead they can be conceived as person’s scope or space of action in for instance a given conflict between his/her self-meaning context and other-meaning context. The perceived space of action here reasonable differs at increasing orders of SOT. Further, the action possibilities can be stated in more outside-objectively defined terms. Action theoretical lines of reasoning (for instance Hagström & Hanson, 2003) and its application in the work life domain (for instance Volpert, 1989; Frese & Zapf, 1994) may be fruitfully related to constructivistic-developmental lines of reasoning (Hagström, 1995) in the frame of what we prefer to call a “transform-actional approach.”

Furthermore, the reasoning of the influence of outside-in part of the development process brings to the fore contemporary and forthcoming complex societal and global demands and challenges. Contemporary post-industrial challenges involve a need for complex thinking, both logical reasoning and meaning making. In terms of Mead's ego conception described above, rapidly economic and technological changing conditions in the transition to a post-industrial society may result in increasing gap between "I" and "me" in terms of changed societal role expectations (Allvin, 1997). These changing conditions apparently require logical reasoning on higher levels of at least systematic and metasystematic orders of hierarchical complexity. Such demands appear to exceed the order of consciousness among a majority of adult populations. In e.g. the US a majority of adults in many studies have been found being below that of the 4th Self-authoring order of consciousness (Kegan 1994; 2003). This cause much of public information flowing beyond many persons meaning horizon "in over our heads" (Kegan, 1994).

Transformative development is reasonable promoted by "the experience of optimal conflict in the context of optimal support" (Kegan, 2003, p. 44). Optimal conflicts refer to inside-out development conditions and optimal support can be associated with the outside-in development requirements. Both these aspects are also reflected in a person's subjective and objective "space of action." Thus a further contextualizing of adult development theory and research may be gained by "transform-actional" ways of reasoning. Further research and theorizing about adult development should be gained by relating the complexity levels to individuals' perceived space of action to more objectively derive such spaces of action in differing societal contexts. The demands in contemporary post-industrial societies towards increasing "disembedding mechanisms" (Giddens, 1991), due to dissolving boundaries of work in time and space, new network promoting connections, global economic transactions and so forth, seem to concern both individual autonomy (referring to a cognitive and an existential dimension) and social integration (referring to a social and societal dimension) (Allvin, *et al.*, 1997).

The opportunities provided by these conditions can be related to individual aspects, such as life courses, career patterns and biographies, as well as social aspects, such as social roles, group affiliations and role models. The new emerging challenge implied in this macro development is to integrate the social and existential demands on more autonomous and complex ways than before (Hagström, 2007). The broad value changes in postindustrial societies from giving priority to materialistic preferences towards given priority to post-materialistic values (e.g. altruism, self-realization) (Inglehart, 1997; 2006) seem to capture individual fulfillment and social integrative value elements guiding people's actions in more self directed ways than earlier. However, these changes, whether or not they are driven by intergenerational value shifts or life span development appear to progress more slowly than the faster global technologically and economically driven flexibility demands. These in turn, appear to reflect contrasting goals and visions related to the reproductive and productive spheres of contemporary societies, expressed e.g. in value preferences, enhancing on one hand individual interests and on the other hand, collective interests (Schwartz, 1996). Against this background increasing knowledge of both inside-out and outside-in conditions gaining transformative development is highly required to meet contemporary and future vital challenges.

Laske's Dialectical Thought Form Framework (DTF) as a Tool for Creating Integral Collaborations: Applying Bhaskar's Four Moments of Dialectic to Reshaping Cognitive Development as a Social Practice[1]

Otto Laske[2]

Abstract: I am introducing into Dialectical Critical Realism (DCR) a developmental, dialogical, and dialectical epistemology for enhancing adults' cognitive development toward dialectic. I do so for the sake of solving real-world problems in a holistic and transformational manner with a high likelihood of success. Emphasis is put on dialectical thinking as a social practice learned by way of a dialogue method called the *Case Study Cohort* (CSC) method, taught at the Interdevelopmental Institute (IDM) since 2000.

CSC combines dialectical with adult-developmental thinking and listening in real world situations. Through this pedagogical framework, students engage organizational clients as midwives of their own learning and development through teaching, coaching, consulting, and/or talent management activities, even psychotherapy.

In 6 sections, the paper deals with the question of how best to educate CDF-users working as *inter-developmental interlocutors* who have overcome the epistemic fallacy by guided self- assessment through DTF, the *Dialectical Thought Form Framework*. This framework operationalizes Bhaskar's MELD based on Basseches' pioneering studies in the development of dialectical thinking over the adult lifespan. DTF forms part of CDF, Laske's *Constructive Developmental Framework*, whose social-emotional and psychological components derive from R. Kegan's and H. Murray's work, respectively. DTF takes up the challenge of teaching and exercising dialectical thinking in an administered world shaped entirely by analytical reasoning.

Inter-developmental interlocutors are CDF/DTF-users who withstand the onslaught of downloading and de-totalization, and by so doing become teachers, even models of global self- awareness. They develop this capacity by acting as a member of an IDM study cohort, as well as consultants to client organizations whose thinking they scrutinize in expertly guided case studies. As a result, their focus of attention becomes the structure of their own and others' thinking as the hidden root of how the social and physical worlds shows up for them and their clients.

---

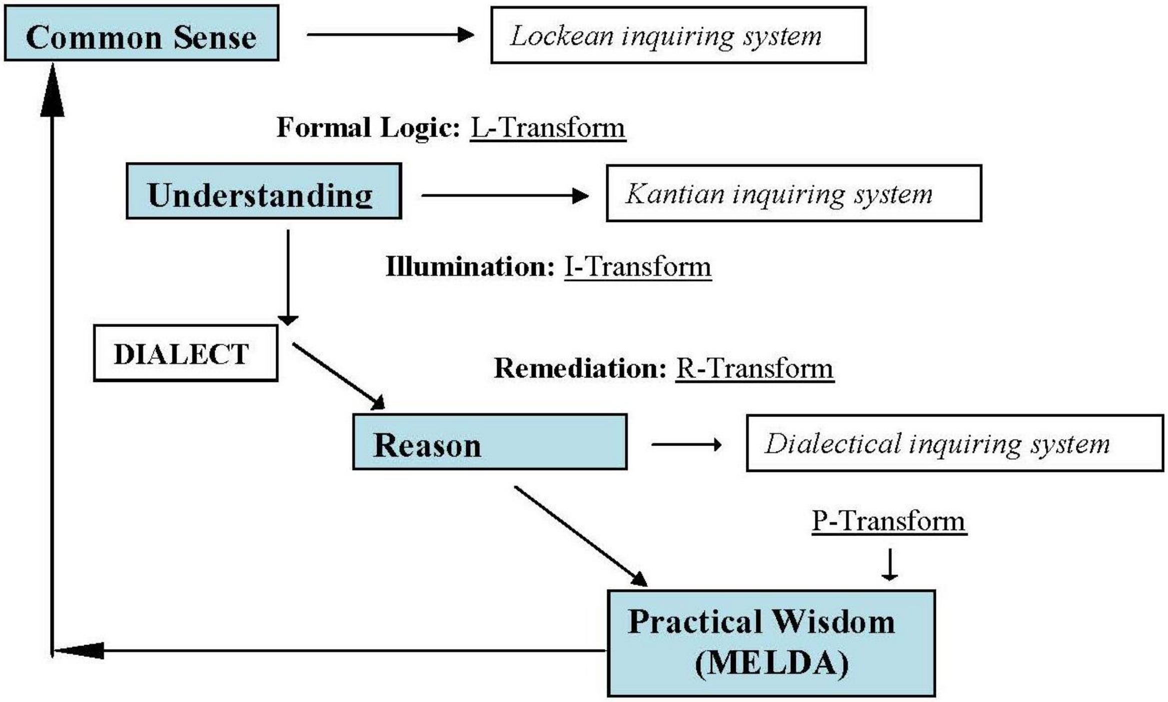
For Theodor W. Adorno (1903-1969)

Short Definition of the Dialectical Thought Form Framework (DTF)

DTF is a dialogical epistemology that links Dialectical Critical Realism (DCR) to the language-suffused social world by way of both developmental and dialectical thinking. It is equally an empirical instrument for discerning and witnessing how and to what extent the world's ontological structure (reflected in Bhaskar's *four moments of dialectic* referred to as MELD[3], Bhaskar 1993) unfolds in an individual's mind and speech during a 1-hour semi-structured *cognitive* interview. As an epistemology it is based on the assumption that human consciousness progresses through four eras of cognitive development, which Bhaskar has called *Common Sense, Understanding, Reason,* and *Practical Wisdom,* and that consciousness encounters its own dialectic during the transition from Understanding to Reason, in four steps, as shown below.



Common Sense
Lockean inquiring system
Formal Logic: L-Transform
Understanding
Kantian inquiring system
Illumination: I-Transform
DIALECT
Remediation: R-Transform
Reason
Dialectical inquiring system
P-Transform
Practical Wisdom (MELDA)

Figure 1: Bhaskar's four eras of adult cognitive development.

---

[3] MELD is an abbreviation of the names of Bhaskar's four moments of dialectic which in his ontology he refers to as 1M, 2E, 3L, 4D. They are epistemologically rendered in CDF a CPRT (Context, Process, Relationship, and Transformation) standing not for dimensions of being but classes of thought forms that spell out MELD in the human mind, thereby defining the structure of human thinking. A lucid description of the relationship between MELD and CPRT is found is Laske's *Dialectical Thinking for Integral Leaders: A Primer*, Integral Publishers, 2015.

The entry of the human mind into dialectic when crossing over from Understanding to Reason was first documented in the transition from Kant to Hegel in the period between 1781 to 1807. According to developmental research done by the Kohlberg School at Harvard between the years 1975-1995, this unfolding begins ontogenetically in late adolescence and ends only with the end of individual life.

As an empirical instrument, DTF bridges DCR and the language-suffused social world through the dialectical listening and thinking capacity of its expert users.

Pedagogically, DTF is exercised by the instructor of IDM study cohorts whose members interview clients in order to scrutinize the thought-form structure of their recorded speech. They do so in the context of clients' organizational function/role, environment, and professional agenda and their team membership. Through such a cognitively focused interview it becomes possible to lay bare the dialectical structure of clients' speech. The assumption made is that the social world is a language-suffused universe, and that it is straightforward to determine empirically differing degrees of clarity to which MELD manifests itself in a particular mind based on the textual or auditory analysis of a DTF interview. Although such an interview is co-created by a DTF interviewer as well as an interviewee (in most cases, an executive), the resulting *cognitive profile* is nevertheless understood as being that of the client.

To determine the degree of clarity of dialectical thinking in a client's speech empirically, a DTF expert collaborates with members of a study cohort of inter-developmentally bonded individuals whose task it becomes to scrutinize traces of MELD in spoken language. The cohort as a whole (which includes the instructor) evaluates ("scores") the cognitive interviews of members' clients. This assures inter-rater reliability based on which valid feedback can be given to clients.

In the DTF framework, evaluation of cognitive interviews happens in terms of *four classes of thought forms*, called CPRT (C=context; P=process; R=relationship; T=transformation). As shown below, these classes directly reflect Bhaskar's MELD (Laske, 2009). The evaluation yields empirical data useful in scaffolding the dialectic-thinking capabilities of an individual or team by way of teaching, coaching, mentoring, consulting, psycho- and socio-drama, and psychotherapy.

It should be clear that the above outline positions epistemology within ontology. As shown below, dialectical thought forms are not perspectives. DTF is cogent only when presupposing a real world that is not permanently withdrawn, as is Sartre's *être en soi*, but can be "grasped" dialectically through what Hegel has called "the effort of the concept (*Anstrengung des Begriffs*)." It is this effort that the IDM certification program in CDF/DTF is designed to re-instill. This effort is the exact opposite of contemporary *downloading*; it corresponds in spirit but not in method to teachings that Adorno and Horkheimer conveyed in their *Hauptseminar* between 1951 and 1969 at Frankfurt University, Germany.

***

With Piaget, I am making the assumption that in speaking, humans reveal not only the *contents*, but also the dialectical *structure,* of their movements-in-thought. In this paper, I am detailing how specifically ontological MELD-structures show up epistemologically in DTF-based listening to human speech. As shown in Fig. 2, above, a DTF listener-thinker functions as a bridge between DCR and the language-suffused social world, and thus functions as a transformational agent.

Below, I will detail in what way M. Basseches' work, published in "Dialectical Thinking and Adult Development" (1984) 30 years ago, has built a bridge between ontology and dialectical epistemology, without elaborating in detail the refinements of this great researcher's work that yielded Laske's DTF.

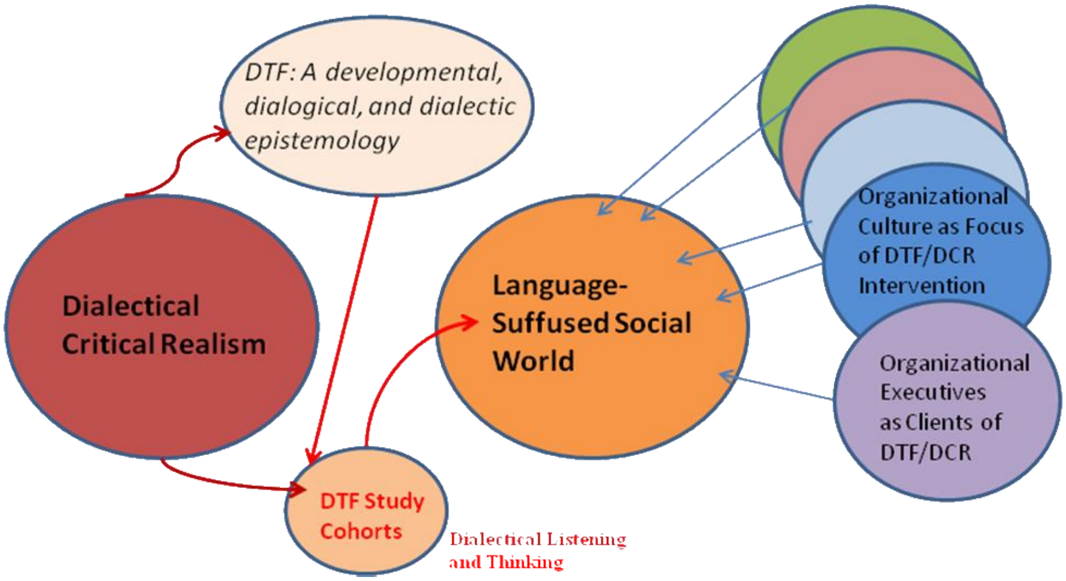
Rather, my emphasis will fall on my teaching practice within pedagogical cohorts whose members, by scrutinizing a specific executive's speech, "wake themselves up" to their own mind's dialectic (that heretofore they were unable to grasp). I will reflect on how and why such a cohort can be seen as a pedagogical context for developing within DCR a dialectical social practice of real-world interventions. I also view a case study cohort as embodying the core of a future critical in-depth social science, and the beginning of integral collaborations poised to solve problems in the real world, such as global warming.

In this way, I am binding collaborative action to what Cook-Greuter has called *construct awareness*, but will use this term in a purely cognitive, rather than (following Kegan and Loevinger) social-emotional, way, as she does. I will envision integral dialectical thinking as becoming the central practice of the integral movement, to the extent that the integral community can actually shift from the reduction of the real world to subjective enactments to the recognition that the mind is constellationally embedded in the real world *inde ab initio*.

Operationalizing Bhaskar's MELD Based on Basseches' Dialectical Schema Framework

As intimated in Fig. 2, the *Dialectical Thought Form Framework* (DTF) is best understood as serving a bridging function between DCR and the language-suffused world of society's organizations and their constitutive cohorts (teams). For this purpose, it comprises a social-emotional component following Kegan (1982; 1994), a cognitive component following Adorno (1966; 1999), Basseches (1984), and Bhaskar (1993), and a psychological component following Henry Murray (1938). Its methodology is part of an inter-participatory framework through which to further adult mental growth at work and in life.

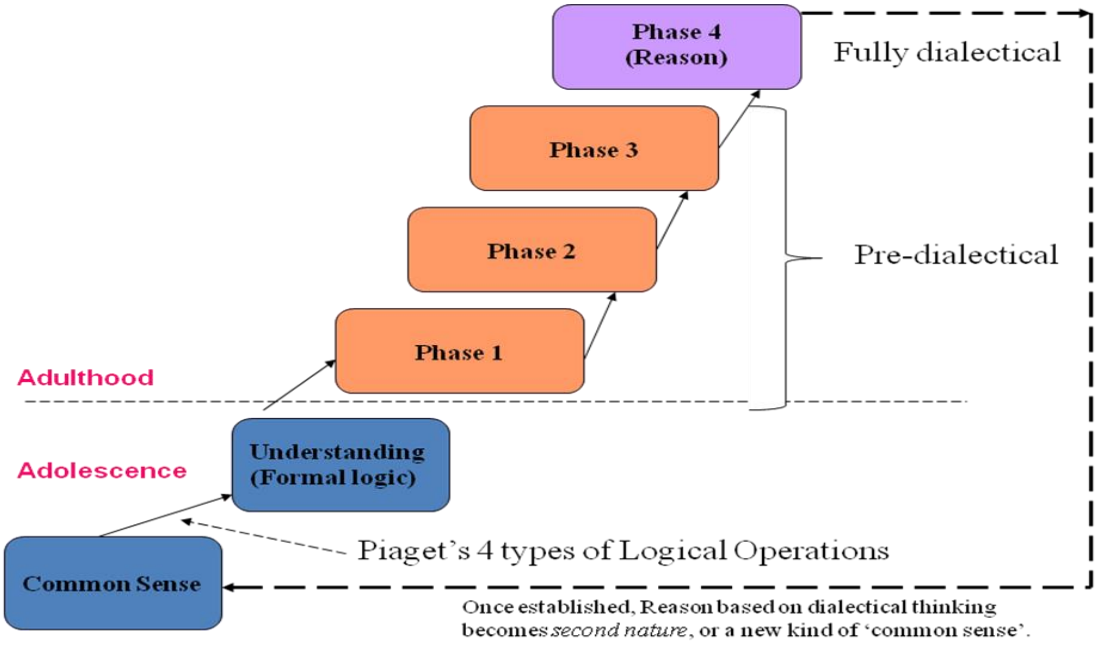
Although the systemic connectedness of CDF's three components is the focus of my teaching of coaches, consultants, and executives at the Interdevelopmental Institute (IDM; www.interdevelopmentals.org), here I will restrict myself to the cognitive component of CDF, which is called DTF. DTF was developed in 1999 in a thesis on developmental coaching, by linking Bhaskar's MELD to Basseches' dialectical schema framework (DSF).



DTF: A developmental, dialogical, and dialectic epistemology
Dialectical Critical Realism
Language-Suffused Social World
Organizational Culture as Focus of DTF/DCR Intervention
Organizational Executives as Clients of DTF/DCR
DTF Study Cohorts
Dialectical Listening and Thinking

Fig. 2. DTF powered by DTF study cohorts serving a bridging function between DCR and the language-suffused social world of organizations.

Using DTF centrally requires mature dialectical thinking and listening in real time. Its dialogue- propelled way of functioning derives from Basseches' work in the early 1980s. In 1984, after 6 years of researching empirically the development of dialectical thinking over the individual life span, Basseches published a seminal work called "Dialectical Thinking and Adult Development" in which he presented his findings in a way summarized by Fig. 3, below:



Phase 4 (Reason)
Fully dialectical
Phase 3
Phase 2
Pre-dialectical
Phase 1
Adulthood
Understanding (Formal logic)
Adolescence
Piaget's 4 types of Logical Operations
Common Sense
Once established, Reason based on dialectical thinking becomes *second nature*, or a new kind of 'common sense'.

Fig 3. The four phases of dialectical-thinking development in adults according to Basseches/Laske.

For the purposes of his qualitative research, Basseches created a semi-structured interview in terms of which he dialogued with staff and students of a US college about issues in contemporary education. It was his purpose to answer the genuinely pioneering question "how does dialectical thinking develop over the individual life span?" Basseches asked this research question based on the hypothesis that cognitively more highly developed individuals, represented by teaching staff, would show higher levels of dialectical thinking than students. He measured this developmental differential by way of a "fluidity index" indicating fluidity in the use of four classes of thought forms.

Basseches found by evaluating ("scoring") recorded interviews that one could speak of four phases (rather than stages) of dialectical-thinking development, where each phase is defined by a maximal fluidity index (phase 1 = >10, phase 2 = >10<30, phase 3 = >30<50, phase 4 = >50). Simplifying Basseches' findings slightly, one can say that each phase of thinking-development toward dialectic is characterized by the dominance of one of Bhaskar's four moments of dialectic (MELD), in the order of 1M, 2E, 3L, and 4D (Laske, 2009).

In DTF, MELD is epistemologically represented by four classes of dialectical thought forms called *schemata* by Basseches. The most advanced dialectical thought forms, called "transformational," entail an understanding of negativity that fully emerges only in phase 4 of cognitive development. DTF is an *action method* for deepening inter-developmental relationships meant to lead to novel, emancipatory experiences via dialectical thinking.

The DTF system as a whole is geared to exploring in real time how MELD maps into speech via concepts. In actual usage, each MELD component, represented by a thought form class, serves as a tool to lay bare a speaker's or writer's category errors (e.g. de-stratification) as they occur in real time. The assumption is that by highlighting and giving feedback on such errors, a speaker can move from the actual to the real world.

When we put Basseches' findings in a context familiar to readers of Bhaskar (1993), shown in Fig. 1, we can see that the four phases of dialectical-thinking development referred to in Fig. 3 fall into the transition from Understanding to Reason. The four phases give rise to different forms of illuminative and remediative dialectical commentary, whether exercised during real-time dialog (interviews) or in hermeneutic text analysis:

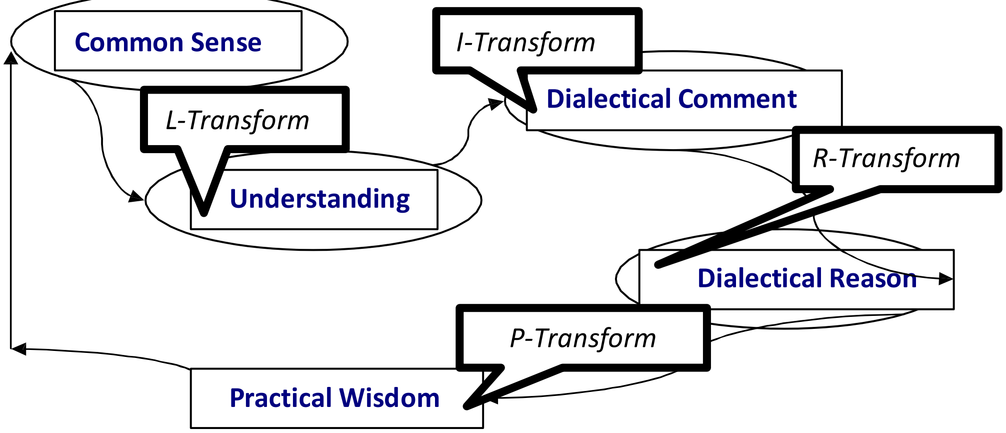

Fig. 4. The four transforms of dialectical thinking according to Bhaskar (1993).

The I- and R-transforms utilize Basseches' four classes of dialectical thought forms, referred to as C, P, R, and T, a focused and selective representation of Bhaskar's MELD geared to exploring the dialectical structure of dialog or written text in real time (Context = M1; Process = 2E; Relationship = 3L; and Transformation = 4D):

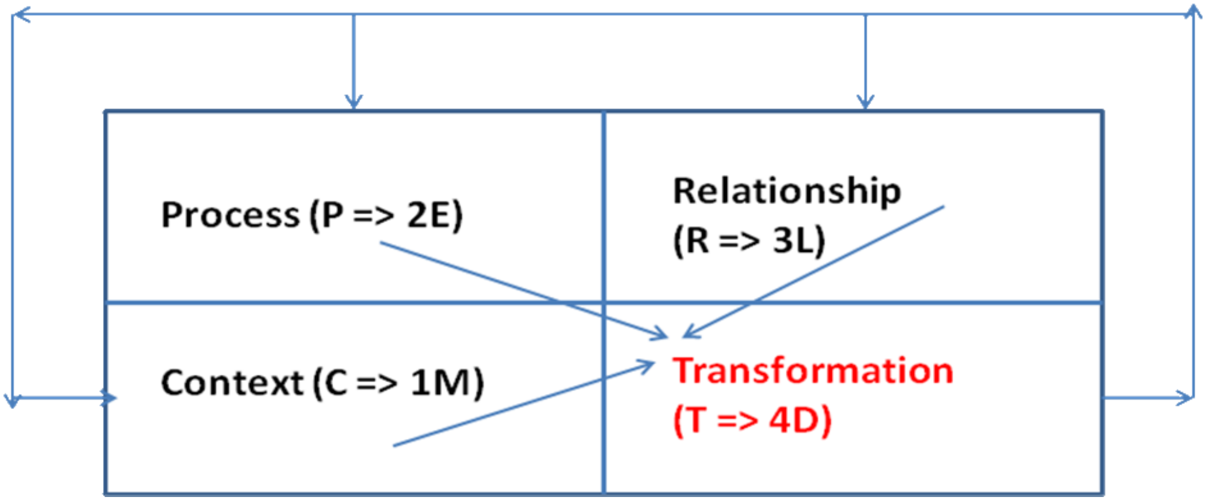

Fig. 5. The four classes of thought forms associated with MELD in DTF (P=2E; C=1M; R=3L; T=4D

While C, P, and R thought forms illuminate lack of dialectical thought expressed in category errors occurring in speech or text, T-thought forms are *remediative*, sublating and integrating elements held in a speaker's or writer's memory store, and thus absent category errors.

DTF- interlocutors hear, and then showcase, specific category errors made in speech or text. In each of the four classes of thought forms, a particular category error is paramount: de-stratification in C (1M), denial of negativity in P (2E), de-totalization in R (3L), and de-agentification in T (4D).

As Fig. 5 indicates, *transformational* thought forms reside on a meta-level, in the sense that not only are they grounding the other 3 thought form classes (outer arrows), but are simultaneously based on them in a feedback loop intrinsically binding all four classes of thought forms into a transformational system (internal arrows) replicating MELD in thought. T-thought forms capture adult cognitive development as an internalized form of (ontic, rather than agentic) agency, i.e., natural emergence of dialectical out of logical thinking.

Logistically, each of the four classes of thought forms comprises 7 consecutively more complex thought forms, as shown in Table 1, below. "Contrasts" indicate links with related thought forms intrinsic to a particular thought form allowing for fine differentiations to be made.

Table 1: DTF Taxonomy of Dialectical Thought Forms

Process TFs (2E) Illumination	**Context TFs** (1M) Illumination	**Relationship TFs** (3L) Illumination	**Transformational TFs (Meta-systemic)** (4D) Remediation
1. Unceasing motion, negativity *Contrast: 22*	8. Contextualization of part(s) within a whole; emphasis on part *Contrast: 10-13*	15. Limits of separation. Focus on existence and value of relationship *Contrast: 16-21*	22. Limits of stability, harmony, durability (incl. quantitative into qualitative changes) *Contrast: 3, 12, 23*

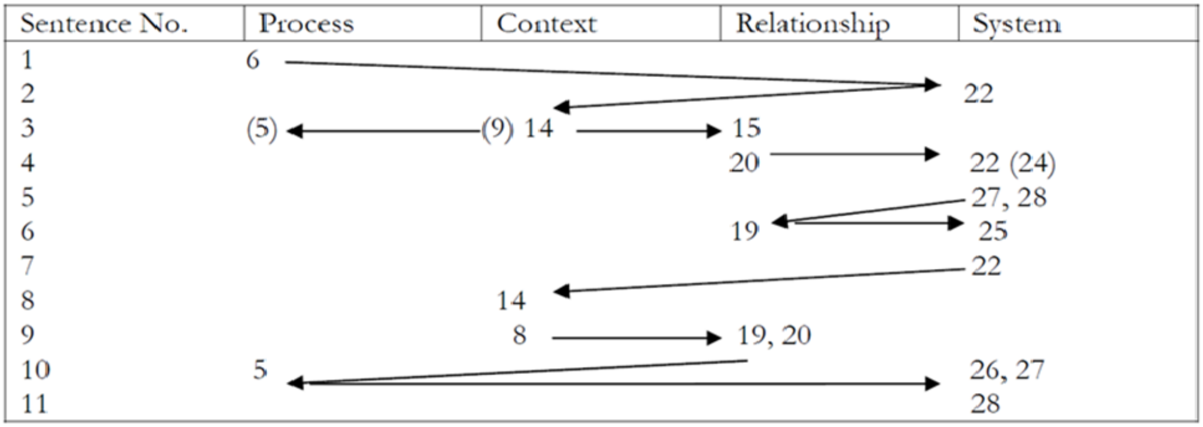
Integration of multiple perspectives in order to define complex realities; critique of formalistic thinking *Contrast: 2, 6, 16*

In DTF, these 28 thought forms, refined from Basseches' *Dialectical Schemata Framework* (DSF), serve at least five different functions, whether in scrutinizing speech or text. These are:

1. Dialectical listening tools;
2. Dialectical text analysis tools;
3. Cognitive (interview) prompting tools;
4. Mind opening (retroduction) tools; and
5. Mind expanding tools.

By using DTF thought forms as listening and assessment tools, an adult's *movements-in-thought*, articulated in an interview or written text, can be empirically assessed, both in terms of the DTF Fluidity Index and other cognitive indexes deriving from it (Frischherz, 2014a).



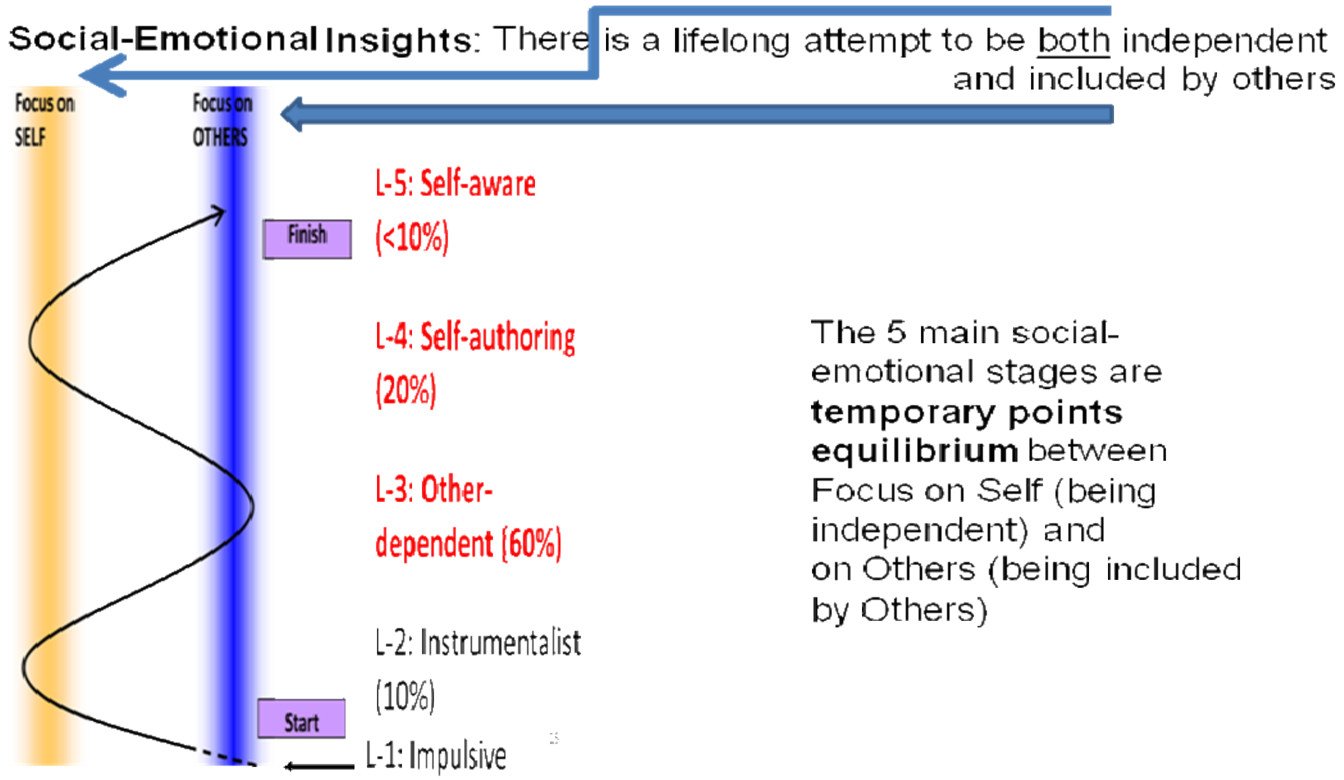
Sentence No.	Process	Context	Relationship	System
1	6			
2				22
3	(5)	(9) 14	15	
4			20	22 (24)
5				27, 28
6			19	25
7				22
8		14		
9		8	19, 20	
10	5			26, 27
11				28

- Fluidity Index = 3+4+5+10=22
- Cogntive Score = [14, 19, 24; 48(%)] – hollow transfer thinking
- Systems Thinking Index = 48 (%)
- Discrepency Score = (4+10) : (3+5) = 14 : 8 – Manager C is a better constructive than critical thinker

Fig. 6. Cognitive Behavior Graph of a manager, showing the movement in thought of his interview, associated with DTF cognitive scores (Frischherz, 2014a).

The Integral Movement is Composed of Upwardly and Downwardly Divided Cohorts Characterized by Social-emotionally Determined Thinking Limits

I have introduced you to a framework for working with clients (including students) by merging dialectical with developmental thinking, for use by teachers, coaches, consultants, and managers as clients' dialogue partners. These clients always reside in social cohorts characterized by a wide variety of thought-form structures apparent in listening to their speech in semi-structured interviews. When heard through the lens of CDF (i.e., analyzed both social-emotionally and cognitively), verbal language expressions show clear structural differences in thinking. When these differences are scrutinized in empirical case studies, one finds that specific Kegan-stages are associated with specific limits of dialectical thinking capability (measurable in terms of the DTF fluidity index and related cognitive scores).

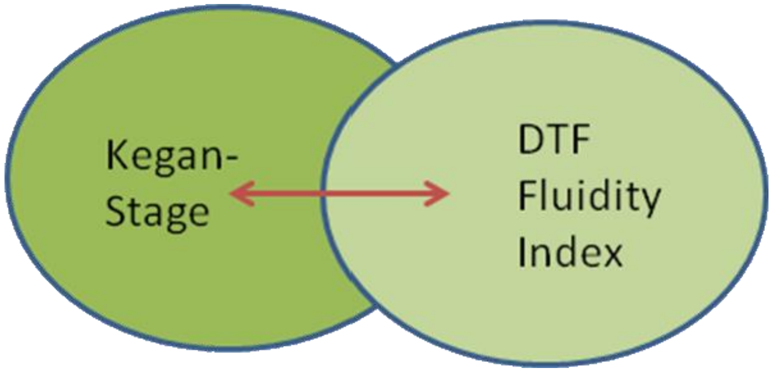


Social-Emotional Insights: There is a lifelong attempt to be both independent and included by others
Focus on SELF
Focus on OTHERS
Finish
Start
L-5: Self-aware (<10%)
L-4: Self-authoring (20%)
L-3: Other-dependent (60%)
L-2: Instrumentalist (10%)
L-1: Impulsive
The 5 main social-emotional stages are temporary points equilibrium between Focus on Self (being independent) and on Others (being included by Others)

Fig. 7. Social-emotional stage progression according to Kegan.

This is, of course, to be expected since making meaning at a specific Kegan-level presupposes residing in a specific phase of dialectical thinking capability.

On account of the fact that members of a cohort make meaning along Kegan's trajectory of social-emotional stages while also residing in a specific phase of dialectical-thinking development, we can speak of cohort-specific *thinking limits*. In teaching and carrying out organizational interventions, the intrinsic nexus between a social-emotional Kegan-stage of *meaning making* and a particular phase of *making sense* of the world through dialectical thinking clearly comes into view, as intimated in Fig. 8 (see also Laske, 2009: 253).



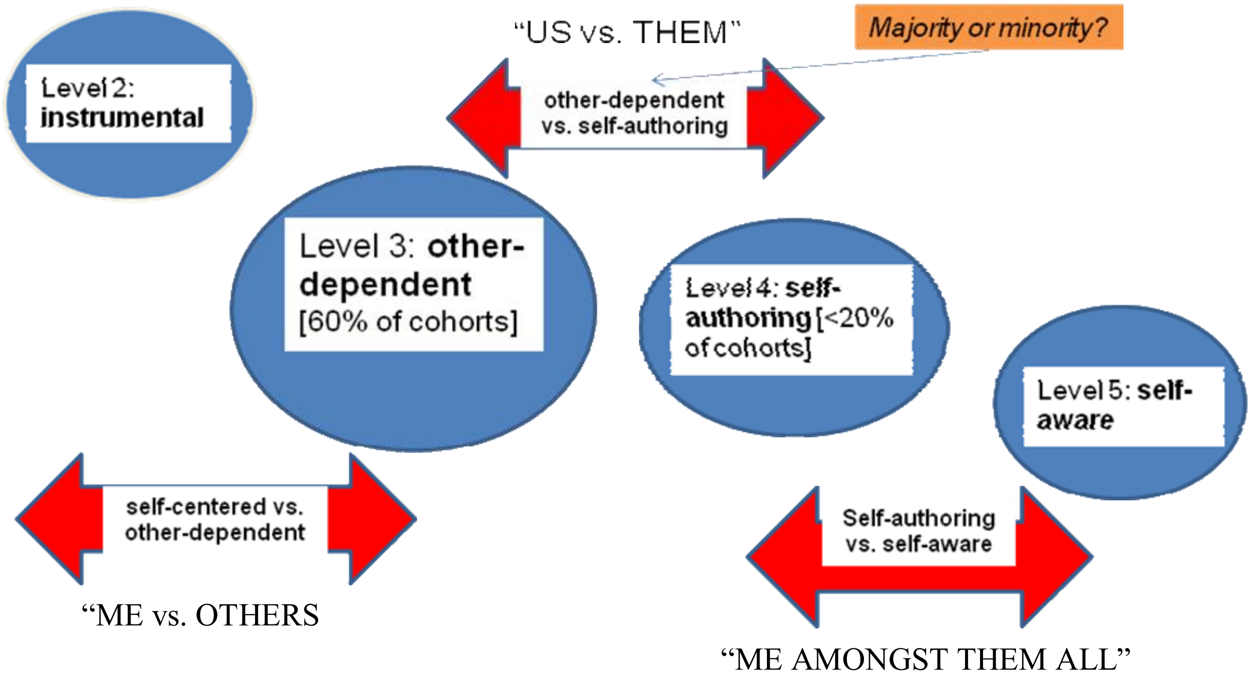
Kegan-Stage
DTF Fluidity Index

Fig. 8. Nexus between social-emotional meaning making and cognitive sense making in CDF.

In terms of pedagogical pragmatics this entails that the social-emotional structure of integral cohorts has a direct bearing on how far programs of DTF-dialectical thinking can help shift integral thinking from Bhaskar's argument-based dialectic to a developmental and dialogical epistemology required for using DCR in the organizational world (not to speak of a shift from Wilber's enactments to dialectical thinking). DTF delivers a straightforward metric for whether a particular cohort succeeds or fails in that transition.

Taking into account that integral cohorts whose members reside at one and the same Kegan level are largely fictitious, we view integral cohorts more realistically as composed of a developmental majority vs. minority within a particular Kegan-range (2-3, 3-4, 4-5). I will refer to these cohorts as *upwardly or downwardly divided*. It therefore makes sense to think about the composition of the integral movement itself in terms of developmentally different cohorts shown in Fig. 9, and detailed further in Figs. 10 and 11, below.

1. *Upwardly divided level-2 cohorts (UD2);* majority at level 2, minority at level 3
2. *Downwardly divided level-3 cohorts (DD3);* majority at level 3, minority at level 2
3. *Upwardly divided level-3 cohorts (UD3);* majority at level 3; minority at level 4
4. *Downwardly divided level-4 cohorts (DD4);* majority at level 4, minority at level 3
5. *Upwardly divided level 4 cohorts (UD4); majority at level 4, minority at level 5*
6. *Downwardly divided level 5 cohorts (DD5); majority at level 5; minority at level 4*

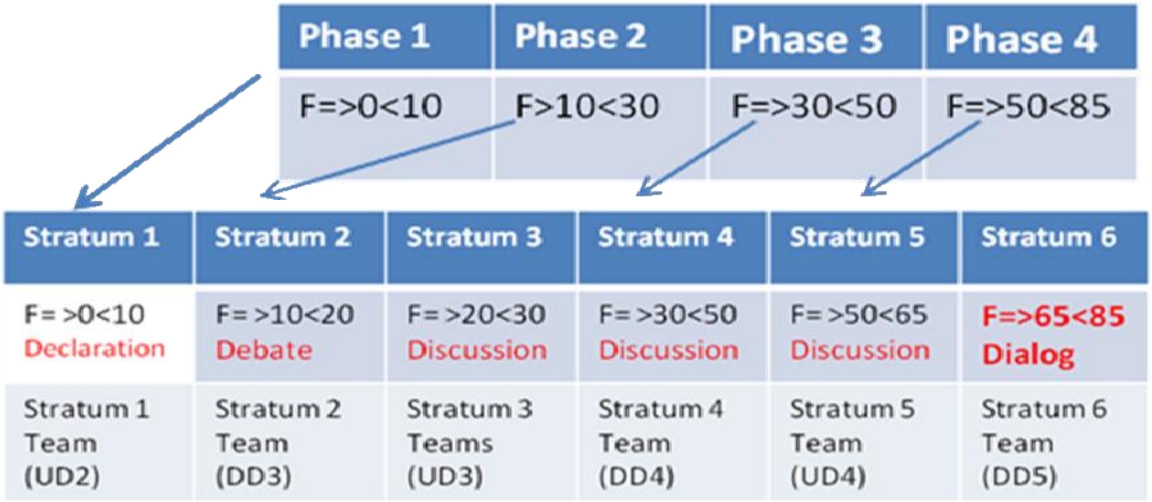


"US vs. THEM"
Majority or minority?
Level 2: instrumental
other-dependent vs. self-authoring
Level 3: other-dependent [60% of cohorts]
Level 4: self-authoring [<20% of cohorts]
Level 5: self-aware
self-centered vs. other-dependent
Self-authoring vs. self-aware
"ME vs. OTHERS
"ME AMONGST THEM ALL"

Fig. 9. Social-emotional differences between cohorts, leading to the distinction of 6 structurally different developmental types of cohort, further detailed in Fig. 10 and 11.

In each cohort, the developmental tension between majority and minority results in idiosyncratic social-emotional cultures characterized by specific *thinking limits* that stem from the different levels of *cognitive development toward dialectic* of the cohorts' members. In Fig.

10, below, I refer to these thinking limits by the term “stratum”, thereby differentiating the quality of management of complexity members of a particular cohort are capable of, as well as the specific thematic focus of their universe of discourse at the workplace (Jaques, 1998).



Phase 1	Phase 2	Phase 3	Phase 4
F=>0<10	F>10<30	F=>30<50	F=>50<85

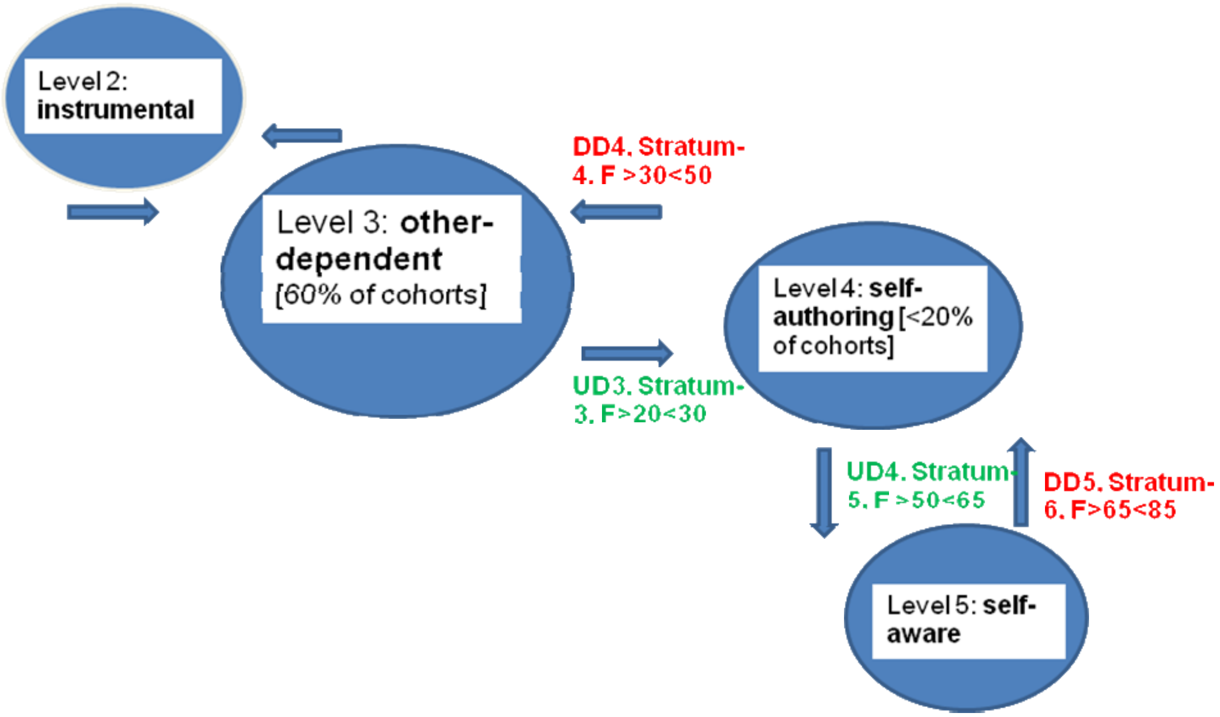
Stratum 1	Stratum 2	Stratum 3	Stratum 4	Stratum 5	Stratum 6
F= >0<10 Declaration	F= >10<20 Debate	F= >20<30 Discussion	F= >30<50 Discussion	F= >50<65 Discussion	**F=>65<85** **Dialog**
Stratum 1 Team (UD2)	Stratum 2 Team (DD3)	Stratum 3 Teams (UD3)	Stratum 4 Team (DD4)	Stratum 5 Team (UD4)	Stratum 6 Team (DD5)

Figure 10. Thinking limits (F) of 6 developmentally differing cohorts, calibrated in terms of the DTF Fluidity Index.

As we move from UD2=Stratum-1 cohorts (in which the cohort majority resides on Kegan-level 2) to DD5/Stratum-6 cohorts (in which the cohort majority resides on Kegan-level 5), their thinking limits, in terms of dialectical-thinking capability, are dramatically altered.

For example, a downwardly divided level-4 cohort (DD4; in which most members reside at Kegan-stage 4 while a minority remains at level 3) has a surer grasp of absence and negativity than an upwardly divided level-3 cohort (UD3), and this cognitive differential can be precisely assessed through DTF. Importantly, this differential is likely to determine the relationship of a cohort’s *interpersonal* process to its *task* process. The latter is determined by cohort members’ phase of dialectical thinking, and in more immature cohorts tends to become overwhelmed by cohort members’ interpersonal process.

We can say, then, that each of the six cohort types distinguished in Fig. 11 is characterized by a peculiar quality of discourse fully aligned with its thinking limits. For instance, according to Fig. 11, even logical debate is unlikely in a UD2/Stratum-1 cohort, while a UD3/Stratum-3 cohort can be expected to have a beginning grasp of absence (DTF process thought forms; 2E), having begun to acquire thought forms articulating negativity that are missing from a more immature consciousness. Clearly each of these subgroups has its own epistemological subculture that, in turn, demands a differentiated pedagogical approach to dialectical thinking.

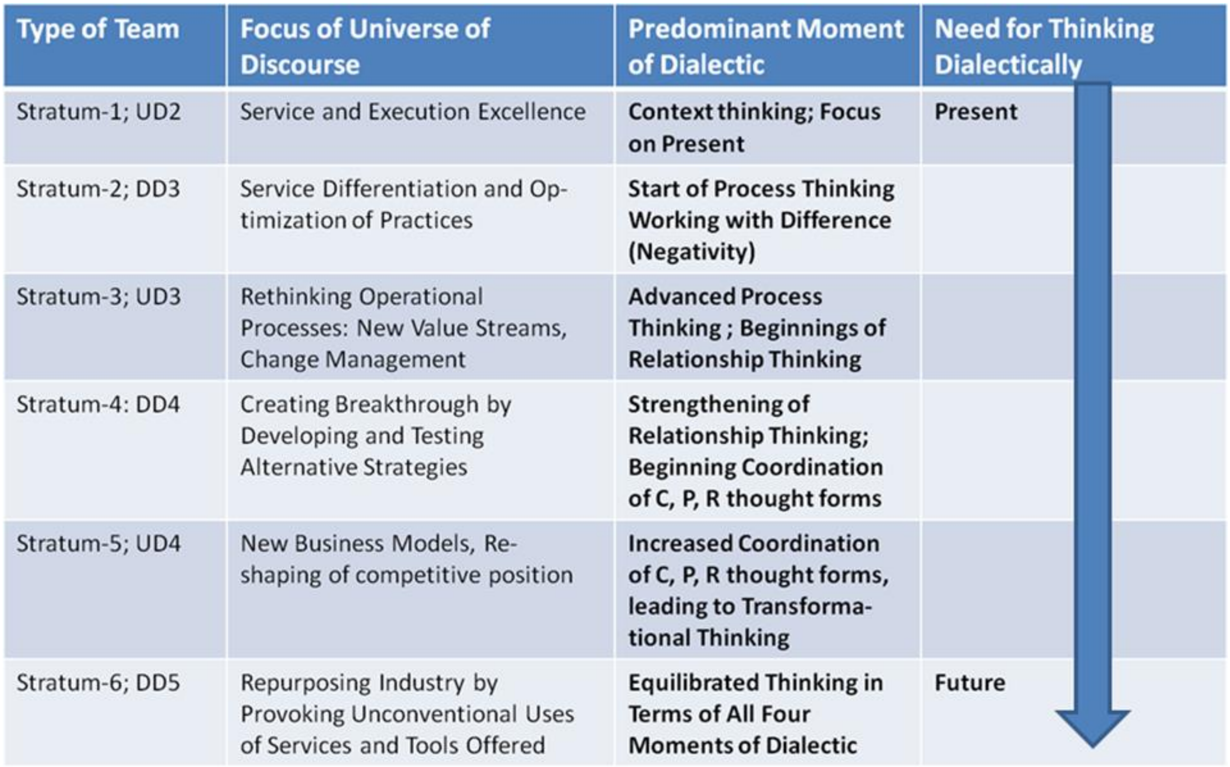


Level 2: **instrumental**
Level 3: **other-dependent** [60% of cohorts]
Level 4: **self-authoring** [<20% of cohorts]
Level 5: **self-aware**
DD4. Stratum-4. F >30<50
UD3. Stratum-3. F>20<30
UD4. Stratum-5. F >50<65
DD5. Stratum-6. F>65<85

Fig. 11. CDF cohort typology showing the social-emotional and cognitive developmental differences between cohorts. (Level-3 cohorts are shown as the most numerous).

As shown in Fig. 12, the higher the cognitive stratum of a cohort, the more cohort members are capable of handling complexity in terms of MELD and its DTF thought-form equivalents. Consequently, they will be increasingly open to conceptualizing issues referring to future potentials, rather than being wedded to the status quo, thus differing in terms of transformational thinking capacity. Simultaneously, true dialogue will increasingly become possible and so will an autonomous task process not compromised by a cohort's interpersonal process.

These assessment-based considerations of developmentally different cohorts lead to the question of "how to guide integral cohorts on a developmental journey that amounts to a mental growth assignment?"



Type of Team	Focus of Universe of Discourse	Predominant Moment of Dialectic	Need for Thinking Dialectically
Stratum-1; UD2	Service and Execution Excellence	**Context thinking; Focus on Present**	**Present**
Stratum-2; DD3	Service Differentiation and Optimization of Practices	**Start of Process Thinking Working with Difference (Negativity)**	
Stratum-3; UD3	Rethinking Operational Processes: New Value Streams, Change Management	**Advanced Process Thinking ; Beginnings of Relationship Thinking**	
Stratum-4: DD4	Creating Breakthrough by Developing and Testing Alternative Strategies	**Strengthening of Relationship Thinking; Beginning Coordination of C, P, R thought forms**	
Stratum-5; UD4	New Business Models, Re-shaping of competitive position	**Increased Coordination of C, P, R thought forms, leading to Transformational Thinking**	
Stratum-6; DD5	Repurposing Industry by Provoking Unconventional Uses of Services and Tools Offered	**Equilibrated Thinking in Terms of All Four Moments of Dialectic**	**Future**

Figure 12 (for column 3, see also Figure 1, upper left) Cohort differences in the ability of handling organizational complexity as a function of social-emotional composition and phase of dialectical thinking measured through DTF.

A *Train the Trainer* Program and Peer Training Program in Dialectical Thinking: IDM's Case Study Cohort Method (CSC)

The answer to this question adopted at IDM is referred to as the "case study cohort" method of teaching (CSC). Its name derives from the fact that IDM study cohorts are organized around the pedagogical goal of writing a developmental case study on a single organizational client. The case study involves carrying out a social-emotional as well as cognitive interview (if not also administering a psychological questionnaire), to be evaluated by cohort members for the purpose of giving feedback to clients under the supervision of the Director of Education. The latter functions as a supervisor who also guarantees assessment inter-rater reliability. Along the IDM certification track, writing such a case study requires 10 months of study of both dialectical and social-emotional thinking and listening, in work with interviewees coming from both for-profit and non-profit organizations. As a consequence, it is organizational clients whose concerns provide the real-world environment for students' learning and development, acting as midwives of their development into expert CDF/DTF users.

We use this method of teaching in two forms:

1. An "artisan" (esoteric) form for educating CDF trainers (http://www.interdevelopmentals.org/assessment-certification.php).

2. An applied (exoteric) form for those not intending to become CDF or DTF experts, but rather striving to use these frameworks in immediately rewarding applications, including starting a new business (http://www.interdevelopmentals.org/Applied_CDF_Courses.php).

In full recognition of the pragmatic demands of students' organizational clients, a case study is about people-in-context, especially executives, and this is reflected in the structure of the cognitive interview that explores executives' *internal workplace* i.e., the way executives conceptually represent their function, tasks, work environment, and professional agenda (Laske, 2009; Jaques, 1998). These clients form the *invisible cohort* associated with IDM study cohorts. Meta-theoretically, each case study takes on clients' epistemic fallacies and category errors that condemn them to positivistic thinking and downloading rather than allowing for deep, dialectical thinking. For this reason, by using DTF for revealing executives' movements-in- thought and giving them feedback on the structure of their present thinking in terms of MELD, DCR could move closer to acting as an *educational* force within society.

As my colleague J. DeVisch has shown in two recent books (2010; 2013), absence of dialectical thinking in executive teams not only obstructs social change, but also eventually leads to companies' sub-performance or even demise. Executives' epistemic fallacies, which ultimately sabotage emancipatory change within and without companies, clearly come to light during a 1-hr recorded and transcribed cognitive interview scrutinized by an entire IDM study cohort. Structurally relevant interview "bits" are weighted in terms of the clarity of thought forms articulated therein, a method of qualitative research that when applied to written text such as annual reports is referred to as *dialectical text analysis* (Frischherz, 2013; 2014a). It is a hallmark of dialectically complex texts that they invite to be scored not only in terms of single thought forms, but constellations of thought forms from different classes (Adorno, 1999: 134ff.), as shown by the example below.

Cognitive interviews center on laying bare clients' category errors and epistemic fallacies. These are seen as hindering the speaker from living in the real world. Category errors are thought to come to light in the way base concepts are differentiated by clients. In the interview fragment quoted above, the *base concepts* of "force field" and "system stability" are explored by the interlocutor. By way of the DTF Thought Form Scoring Sheet shown, the study cohort mentally reconstructs the client from a third-person perspective for the purpose of cogent feedback.

As this demonstrates, work with CDF, including DTF, is based on dialog, not argument. It is focused on the unpacking of assumptions that lead to category errors in the sense of Bhaskar's retroduction, but for the purpose of assisting clients in their work or life in real time.

Table 2: IDM case study, Thought Form Scoring Sheet. Fragment of a transcribed cognitive interview, cohort-evaluated for the purpose of establishing the interviewee's (executive's) cognitive profile as a basis of feedback to her about the structure of her present thinking; from a 2009 IDM case study.

Bit Number & Thought Form (weighted from 0 to 3)	**Questions to Ask Yourself:** 1) What structural evidence leads you to selecting this Thought Form? 1. 2)If several Thought Forms are applicable, explain your choice. *Note: Weights are assigned to Thought Forms only across the entire interview, not individually.*
Cognitive Interview, Task House (Base Concept #1= "force field"; #2 = "stability")	
Bit #3, TF 21 [weight = 1] (constitutive, intrinsic relationship) TF 22 [weight = 1] (Limits of stability, harmony, and durability) TF17 [weight = 0.5] (Critique of reductionism)	*Interviewer:* You seem to be taking into account what other force fields are playing a role in this company, and what the circumstances are under which this project has started … *Interviewee (Consultant):* Well yes, I was referring to certain forces, some tearing things apart, others holding things together, and the conflict energy needed to transform the status quo. *Interviewer:* If you look at those force fields more closely, what do you see? *Interviewee:* Well, the dilemma lies in that efficiency should be increased while no one would lose their job. This is a human resource problem since probably some people do not have the qualities they need to be peak performers. So management wants to lift up the organization towards a more service oriented organization. One issue is the accountability level on which people should perform in their new roles. Another issue is to prepare these people to take a quantum leap. However, they will probably not be able to make this leap under the present reward system, or given what their competences are. So there are many conflicting forces I am seeing, but I doubt that my clients are seeing them. I see a gap between reality and how it is viewed by my clients. But I cannot close this gap for them; I need to educate them so they can see it. *Interviewer:* What does that say, you think, about the system's stability? *Interviewee:* We'll have to consider that there is an external force field as well, and together with the internal one, it may rip the company apart. We are now in a financial crisis, and we haven't seen the deepest point yet. So people are looking at efficiency and they have never, never been confronted with the fact that they will have to lay-off people. They won't be able to do it before the end of 2009 because they signed an agreement with the union. So they won't risk that. Except if they would be confronted with extreme situations. Until now they have government support. But I expect they will be asked to take hard measures by the first half of 2010. And they are not at all preparing for that.

	Justification of the Scoring *In constructing his internal workplace, the speaker sees individuals determined by the constitutive relationships they are in that have defining quality (relationship TF 21); he also points to the overall systemic context as a factor determining the issues that will need to be considered by clients (transformational TF 22). Finally, he articulates a weak critique of reductionism (TF 17), highlighting that his clients are not looking at the outside world.*

DTF dialog is carried out differently in the three complementary modes, as shown in Fig. 13.

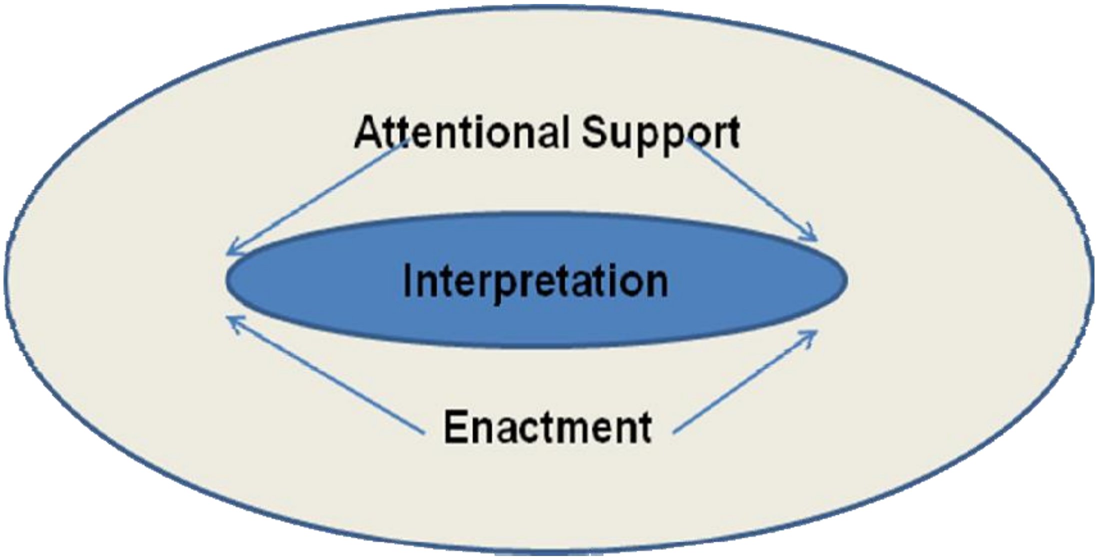


Fig. 13. The three dialog modes of DTF as used in coaching and consulting.

In real time, one of these modes is typically the dominant one, the other two functioning as supports. All three modes require deep listening to clients, but in different ways. In *attentional support*, in focus is discerning the dialectical thought form structure of a client's speech flow, while *interpretation* seizes upon the client's category errors. Once these have been revealed to the client through commentary or questions, the interlocutor proceeds to remediating them, enabling the client to make possible sublations and differentiations (enactment). In this way, not only is analytical reasoning critiqued, but *novel experiences* leading to cognitive development are created clients.

In a society steeped in analytical reasoning, retroductory scaffolding of clients' cognitive development is difficult, encountering many psychological and institutional obstacles that have to be managed by DTF-schooled coaches and consultants. Similar difficulties apply to teaching DTF, in my experience.

The success of a case study cohort hinges on whether cohort members achieve an equilibrated use of the three dialogue modes they are taught in preparing the case study. Each of the three dialogue modes is rehearsed separately, before being linked to others.

1. In the first step, *interviewing*, emphasis lies on *attentional support* for the purpose of discovering the thought form structure of a client's speech. Interpretation and enactment function as supports.
2. In the second step, *interview text analysis*, the cohort dialog focuses on the *interpretation* of a client's interview text in terms of score-able DTF thought forms. Again, the other two modes serve as supports.
3. In the third step, *writing the case study itself* (enactment) is achieved. Each cohort member's task is to pull together in a coherent synthesis all empirical evidence gathered about a client, to document his/her cognitive as well as social-emotional profile. The thesis culminates in a written feedback report formulated on a level the client can readily understand. Through this report, the client herself is given the opportunity for enactment in subsequent evidence-based (team) coaching or mentoring sessions.

In short, an IDM case study cohort schools its members as *inter-developmental interlocutors* who are able to develop their clients, as well as themselves, in emancipatory ways. How far this goal is achieved by each cohort member can be demonstrated by longitudinal CDF assessments of cohort members, one prior to the case study and the other 3 years later (Frischherz, 2014a).

Conceiving of Dialectical Thinking as the Integral Movement's Central Social Practice: Esoteric and Exoteric Programs for Teaching Dialectical Thinking

I have shared some details of the DTF *Train the Trainer* certification program in dialectical thinking in the larger environment of CDF. I have largely dwelt on the "artisan" form of teaching DTF, as exemplified in Fig. 14, to make clear how the manifestation of MELD in human speech is assessed by using the DTF system of thought forms collaboratively. In my experience, this approach is the royal road to learning dialectical thinking, compared to using meditation, discussion, hosting, holocracy, or something even more fashionable. This is the case because students' subjective experience of DTF is balanced against the objective goal of understanding a specific interview text.

There exists a 2nd, "exoteric" or "peer", form of teaching dialectical thinking through DTF whose recipients are managers and executives, rather than CDF/DTF trainers. This second form of teaching is already carried out by those IDM students who work in organizations as consultants, coaches, and mentors, even managers. I think that DCR could begin to show its educational relevance for the organizational world when armed with DTF tools in both forms of teaching.

Conclusions

I would say more generally that through CDF, the severance of dialectical from adult-developmental thinking and listening – which in my view characterizes the contemporary integral community – is shown to be not only one-sided but ineffective. Especially Basseches' work, now 30 years old and further refined in DTF, is highly beneficial in demonstrating just that. The further severance of social-emotional from cognitive development issues, equally widespread today and a legacy of Wilber, is another setback for promoting the pulse of freedom through dialectic. This separation of two intrinsically linked dimensions of consciousness – social-emotional and cognitive – was also practiced by the Frankfurt School including Habermas. I have come to see that this approach ultimately risks reducing dialectic to an academic tool for philosophical culture critique, that is, to a kind of hermeneutic exercise able to fill many books and confound many young minds whose retroduction experiences have no foundation in actual client problems.

The severance of developmental thinking from dialectical thinking is, in my view, equally counter-productive, as is shown not only by the state of the art in the contemporary adult-developmental sciences, but more blatantly by pop-talk about *evolution* that resides far above any valid empirical data base. The store house of epistemic structures accumulated by neo-Piagetians since the 1970's is, to speak with Adorno, rooted in anything but untrammeled dialectical thinking.

These epistemic structures, which have a shocking redundancy (as do developmental models) in fact stand in the way of deep thinking about the human condition, shining a light on nothing but the present state of the social sciences. Since, as we now know, it takes an individual human consciousness a life-time to fully develop its dialectical powers, we need to invest more in educating our contemporaries in dialectical thinking, in ways that take what is known about the trajectory of dialectical-thinking development into account.

In this context, it seems to me that we can use DTF thought forms (Fig. 6) as seeds for developing new, DCR-instantiating, epistemic structures now lacking, instead of borrowing from the neo-Piagetian storehouse. The new DTF-based epistemic structures to be developed will have to be context-sensitive to adult cognitive development over the lifespan. We can develop these structures taking into account the four phases of dialectical-thinking development (see Fig. 3) for whose cogent empirical assessment DTF was originally designed.

As we now know empirically, there exist four different human *Inquiring Systems* that gradually emerge and merge over the human lifespan (Fig. 1). While the Lockean (empirical) Inquiring System does help individuals transcend Common Sense, Hegel showed us 200 years ago that this transcendence remains epistemologically weak. Even when we move to a Kantian Inquiring System, as the sciences do, we fail, as Bhaskar's work has shown, to move closer to the real world because of falling prey to the epistemic fallacy. It is thus imperative that we take advantage of the early stirrings of dialectic in the adolescent mind that Basseches' research has revealed, and build on its momentum, to secure a broader constituency of dialectical thinkers, both in academia and the world of organizations and politics.

***

According to my 15-year teaching experience at IDM, a student who has submitted two CDF case studies based on the "artisan" (rather than the "peer") schooling described above, is ready to enter a program for becoming a trainer of DTF dialectical thinking. Such a student has internalized the dialog partook in during the case study cohort process, and has, in addition, committed to writing her understanding of transcribed interviews in deep dialog with herself. Not only such a person's way of thinking, but also her way of listening to others and communicating with them, has been substantially transformed: she or he can now see the real world as being in unceasing transformation, with herself as a part of it. Once she is so aware, she has become a transformational thinker who is motivated to become an agent working on behalf of the wicked global issues that beset humanity at this point of our history.

I would see DTF trainers certified by IDM as ambassadors of dialectical thinking as much as of DCR. The two make a good practical marriage. DTF practice having become part of students' professional life blood, they can help not only individual clients, but commercial organizations and political factions "get real" about the real world, as most of my students already do. In addition, DTF-trained individuals can begin to influence the social sciences, not only the developmental sciences, and promote a dialog between sciences based on dialectical thinking, something presently non-existent.

If, after reaching maturity in individuals' middle twenties, analytical reasoning is not given a chance to move on to higher phases of dialectic, developmental arrest sets in. The ensuing stasis only deepens individuals' helplessness on account of feeling trapped in the administered world that Adorno predicted 50 years ago. The origin of this helplessness, while it can be covered up by dazzling – even integral – contents, is the structure of adults' thinking that is not on a par with what the contemporary world cognitively requires of its citizens. In what I have shared in this paper, a blueprint for pedagogical action against this contemporary predicament, lack of dialectical thinking, can certainly be discerned and developed further.

***

My ultimate concern in this paper has been one of extending DCR into social practice. "E-ducere" means "to lead out of", and if there is one thing to lead out of it is the absence of dialectical thinking in our culture, already diagnosed by H. Marcuse in the early 1960s (Feenberg & Leiss, 63-71). Since dialectical thinking seems no longer to be viewed as "salon communism", due in part to Roy Bhaskar's work, there is perhaps a chance that we could establish institutes of dialectical thinking as think tanks of the future, threatened as this future now is by global warming. If developed as part of the Institute of Education at this University, a *Center of Dialectical Epistemology* could establish a pioneering agenda: to teach dialectical thinking in an administered world shaped by excessive analytical reasoning. Before addressing the thinking limits of contemporary organizations, however, such an institute would first have to address those of the integral movement's own cohorts.

Strategy as Emergence.
Reviewing the *Practice Turn* in Social, Organizational and Leadership Studies from an Integral Perspective

Elke Fein[1]

Abstract: Practice perspectives are increasingly popular in many social sciences. Moreover, the *practice turn* (PT) has gained influence across various disciplines as a novel epistemological and research perspective. It claims to be able to better explain the workings of social action, among them leadership phenomena in organizations, due to a detailed look onto the micro level. Due to their focus and epistemology, they also claim to be able to better describe and analyze the complexity of social action than more traditional individualistic or institutional approaches. This paper therefore takes a closer look at some of the epistemological claims made by practice perspectives, based on integral epistemological concepts and tools. It proposes a selective discussion of the PT's genuine epistemological value, as well as potential shortcomings, blind spots and limitations.

Keywords: Complexity, development, epistemology, integral, knowledge, leadership, practice turn, relationalism, strategy.

Introduction

Practice perspectives are increasingly popular in many social sciences. Moreover, the *practice turn* (PT) has gained influence across various disciplines as a novel epistemological and research perspective. Its aims are, in a nutshell, to shift the "locus of researchers' attention and the logic of their inquiry" towards bridging gaps between "reality" and scientific knowledge by focusing on the details of what actually happens as social practices happen (Orlikowski, 2010, p. 23). As such, practice perspectives particularly attempt to better explain the workings of social action, among them leadership phenomena in organizations, on the micro level. Due to their focus and epistemology, conceiving of social action as practices embedded in structures and webs of meaning, they also claim to be able to better describe and analyze the complexity of social action than more traditional individualistic or institutional approaches.

From an integral perspective, claims of providing more explanatory complexity and comprehensiveness are generally of high interest. It is therefore worth taking a closer look at some of the epistemological claims made by practice perspectives, based on integral epistemological concepts and tools. To what extent can integral concepts and criteria such as holons, (holonic) inter-

relationalism, cross-field and -paradigmatic multi-perspective and multi-method inquiry and developmental complexity be helpful for evaluating the degree of comprehensiveness of given practice approaches and theories? The paper thus proposes a critical look at practice perspectives viewed through an integral lens. Its aim is not to provide a comprehensive review of practice based research in the field of leadership but rather to provide a selective discussion of its genuine epistemological value, as well as potential shortcomings and limitations. While a more extensive discussion of both the state-of-the-art in integral leadership and in practice research are beyond the scope of this article, the latter aims at recognizing and appreciating the contributions of the practice turn to a more comprehensive analysis of leadership phenomena in organizations, while also illuminating blind spots and potentials of further development.

The paper is organized in four sections. First, it gives a brief overview and dives into the genealogy of the practice perspective, reconstructing basic aims and motivations of practice oriented approaches. The second section shows what exactly these approaches are criticizing with regard to more traditional concepts of leadership and strategy, and how what they themselves have to offer in response to those critiques is framed. Section 3 asks to what extent practice oriented approaches do indeed offer a broader, wider perspective on social action in general, as well as on leadership phenomena in organizations in particular. To what extent can they help to understand and explain those phenomena in a more differentiated way? On this basis, this section also discusses to what extent the practice turn actually provides an epistemological “surplus value” and thereby deserves the label of an epistemological “turn.” In other words, it discusses to what degree practice perspectives offer theoretical innovations going beyond the potentials of more traditional research strategies in the field. Next, section 4 inquires into epistemological limitations, shortcomings and blind spots of practice approaches as seen from an integral perspective. Finally, the concluding section asks to what extent and how perspectives on leadership based on integral theory can systematically reveal and illuminate some of those blind spots and thus, address the respective limitations. In this regard, a particular focus is put, first, on the inner dimensions of social action, in particular on the dimension of consciousness development in leadership phenomena. Another epistemological limitation that can productively be addressed through the lens of an integral perspective is the connection between relations (relationalism) and entities (holism) which are often discussed in practice contexts.

In result, the paper suggests interpreting the PT as a post-modern contribution to leadership theory and proposes a shift towards even more comprehensive perspectives as provided by integral leadership and organization research.

History, Self-Conception and Basic Claims of Practice Based Perspectives

The practice turn has been an important theoretical and epistemological trend in sociology and many neighboring social sciences, amongst them in leadership and organization studies, due to its shift to understanding social action, for example in organizations, on the micro level. By combining first, second and third person perspectives, it aims at describing complex interrelations in a more differentiated way than it has been done in previous approaches, no matter whether they focus on the individual or on institutions.

Historically the practice turn (PT) draws on older theory developments such as the cultural, the linguistic and the interpretative turns, as well as their ontology of constructivism. It takes into account more recent developments such as the performative and process dimensions of social action and structuration. A similar “constructivist shift,” combined with a growing interest in processes, symbols, interactive qualities, grey zones, as well as in the analysis of social complexity and dynamics in general, can also be observed in the field of *Strategic Management* (SM) research, for example in approaches such as *Dynamic Capabilities* (Jarzabkowski/Spee, 2009). In this context, the previously central theoretical and ontological conflict between structure and actor (structuralism versus individualism) is now partly replaced by the tension between substantialism and relationalism (Schneider, 2013).

Concrete precursors of the PT therefore are relational sociologists such as George Herbert Mead, Pierre Bourdieu, Michel Foucault, Anthony Giddens and Bruno Latour, but also post-analytical, phenomenological philosophers like Martin Heidegger, Michel de Certeau or Maurice Merleau-Ponty. Moreover, the PT demonstrates a general trend towards connecting empirical, theoretical and philosophical approaches with social analysis. Among the sources of its theory development and methodology are therefore ethnomethodology and ethnography, cultural history, activity theory, network theory, discourse analysis and Latour’s actor network theory. Finally, pertinent personal experiences of practice researchers seem to be important as well, such as the record of Dalvir Samra-Fredericks who has been working as a community organizer, or work with Change Laboratories reflected by Miettinen/Samra-Frecericks/Yanov (2010, p. 1310). Golsorkhi et al (2010, p. 2) have identified several schools of thought in this regard.

While ethnography observes social actors *in situ* (participant observation), ethnomethodology tries to understand social and moral orders through an analysis of embodied activity, Activity Theory as inspired by Lev Vygotsky sees itself as a psychology of human consciousness and explores its mediations by culture and artifacts. It thereby tries to resolve the dilemma that consciousness has so far been looked at either in its material dimension or via introspection but rarely both at the same time. In contrast, Activity Theory looks at consciousness (*mind*) in an anti-dualistic way as an autonomous reality which is not situated inside human heads but comes into being during the interaction between individual and objective forms of culture created through human work (Gherardi, 2010, p. 1318).

Based on an ontology of relationalism those approaches essentially call for a new “scientific worldview “and epistemological strategy (Schneider, 2013) primarily focusing on patterns and structures of relation(ship)s, as it is done, for example in the network approach. In this context, social order is described as a process and result of interaction (“*how is that done?*”) between various entities. The latter also include material “actors,” i.e. in Latour’s actor network theory (ANT, Latour, 2005). By including various levels of analysis (micro, meso and macro levels, and thus both individual action, group action, processes, organizations and institutions; see Schneider 2013 and Miettinen/Samra-Fredericks/Yanov, 2010) into a systematic reconstruction of relational structures between all of them, these approaches wish to re-conceptualize agency and social action through the notion of practice, focusing on their respective interrelations (Chia/Holt, 2006).

In doing so, relationalist approaches take over the ontology of constructivism holding that humans create both themselves and their material culture, shaping reality through their own cognitive and relational practices (Orlikowski, 2010). The assumption that social structures (may) precede social actions (Merleau-Ponty: "we take structure to be pre-existing," cf. also Miettinen/Samra-Fredericks/Yanov, 2010) is now modified by a stronger focus on the practices through which structure comes into being, i.e. by the "ontological primacy of practice in social life" (Orlikowski, 2010, p. 27). The possibility of action is now understood as pre-defined by networks of practice in which actors are embedded, as well as by socially constructed technologies of communication and calculation (Vaara/Whittington, 2012) which can function as "orders of truth" in the Foucauldian sense. According to Foucault's concept of power and how power is exercised, particular actions are rendered possible or impossible only by specific orders of truth (Foucault, 1982). So given the rather old roots of the PT Miettinen/Samra-Fredericks/Yanow (2010) have legitimately asked if we should not rather speak of a "re-turn."

Just as network analysis, the practice turn (PT) sees itself as a new theoretical approach, sometimes even as a meta-theory and thus, as a strategy for organizing the cognitive space of knowledge or science as knowledge production in a new way. Certainly indeed, theories can also be thought of as hypothetically-deductive systems of concepts and thus, as cognitive networks pre-structuring the processes of cognitive knowledge production of those who use them and who do research within them. In fact, its constructivist ontology is rightly applied to its own scientific practice as well, for example when Orlikowski (2010, p. 30) asks "what kinds of realities are being produced through our social science" and "what kinds of organizational outcomes do we want to help produce." In contrast, meta theories or paradigms are considered to be cognitive entities organizing whole systems of theories in their relation to each other on a higher level of abstraction (Holmberg/Tyrstrup, 2010; for an integral perspective see the Model of Hierarchical Complexity, Commons, 2008).

Even though the "theory of practice" can so far not be considered as a consistent theory (Miettinen/Samra-Fredericks/Yanow, 2010), Andreas Reckwitz has provided a detailed description of the general development of sociological theorizing towards a praxeological understanding of social relations. In his study on the "Transformation of cultural theories" (2000, 2002) he has also formulated a corresponding research program. The core concerns of practice perspectives are, on the one hand, to give attention to micro processes on the level of the individual, i.e. to treat it as a living entity with emotions, motivations, concrete actions and strategies. On the other hand (seemingly paradoxically), practice perspectives concurrently refrain from studying actors in favor of practices which are understood as embedded in social interactions and networks of meaning (see below, Jarzabkowski/Spee, 2009). The aim is thus to better understand the practices of individual actions in the social space (Jarzabkowski/Spee, 2009), not only on the level of individual cognition, identity and so forth, but also and above all in terms of their being part of "meta-individual" discourses and interactions which are called "practices."

Besides the notion of "practice," that of "strategy" is equally important in the context of the PT. As a matter of fact, both of them are closely related when it comes to describing concrete practices and social phenomena. In the field of leadership and management studies a new subfield informed by several concepts of practice has emerged in 2003 under the label of *strategy-*

as-practice-research (SAP). For an overview of SAP research and its main research orientations and agendas see Golsorkhi et al., 2010, p. 3 and Johnson et al., 2003)

While there is no clear-cut or dominant definition of "practice" around, Jarzabkowski/Spee (2009, p. 73) understand "practice" as "a stream of activity which interconnects the micro actions of individuals and groups with the wider institutions in which those actions are located and to which they contribute." On the organizational level practices are also understood as "organizational goings on that give rise to a particular strategic choice rather than on macro-causal factors" (Chia/Holt, 2006, p. 636).

The term "strategy" is not used in an intentional or motivational sense here, but as something usually unconscious or pre-conscious, something immanent, coming into being and manifesting itself in everyday practical action, or as a "consistent pattern in a stream of actions." We are thus dealing with the very concrete and very practical "doing of strategy" on the one hand, i.e. the question "*who does what when and how?*" This happens based on a clear distinction from conventional intentional strategy research (see the paragraph on the PT's concerns below). Moreover, practice perspectives are interested in how the development and the emergence of strategies, as well as their implementation is rendered possible or impossible by existing social and organizational practices and the respective socio-cultural sets of experiences they are embedded in (Vaara/Whittington, 2012, p. 286). In result, the central pretensions and concerns of the PT can be summarized by the claim that organizational and leadership phenomena can be better described by a micro perspective which is closer to the complexity of reality. At the same time, it thereby intends to "humanize" the field of *Strategic Management* (SM) (Pettigrew et al., 2002, p. 12, cit. in: Chia/Holt, 2006, p. 635).

Introductions to and reviews of the PT, the state of research and discussion in the field (which reach out far beyond the areas of leadership and organization), and about the field of *strategy-as-practice* and the empirical research done there can be found in Jarzabkowski/Spee (2009, including a typology and multiple ostensive tables analyzing research on the PT according to specific criteria and streams), in Golsorkhi et al., 2010, in Holmberg/Tyrstrup (2010) and in Vaara/Whittington (2012).

What are the Practice Turn's Main Concerns?
Criticizing Modern Heroic and Functionalistic Perspectives

In the context of general tendencies of theory development in the fields of leadership and organization research the Practice Turn can be situated with regard to the main points of demarcation against which it makes its own claims. What does it criticize and to what extent can it legitimately claim to offer an epistemological surplus value – thereby "earning" its label of being a "turn" in the true sense of the term? To what extent does it offer innovative new perspectives able to compensate for shortcomings, inadequacies or blind spots of previous and hitherto existing approaches and research strategies?

In fact, authors within the fields of practice and SAP research often position themselves and their work in contrast to "outdated" conventional theory perspectives (Holmberg/Tyrstrup, 2010, Jarzabkowski/Spee, 2009, Vaara/Whittington, 2012, Chia/Holt, 2006) by which they usually mean approaches generally qualified as typically modern, such as Taylorism/Fordism, bureaucratic organizations, strategic or scientific management etc.. Since theorists of the practice perspective often make their claims by juxtaposing their own practice approach to *Strategic Management* perspectives, their heuristic project can be illustrated by a comparison of those two perspectives. By *Strategic Management* we hereby mean strategic and functionalistic perspectives which:

- claim that inner-organizational processes can generally be objectively analyzed, and thus planned and controlled,
- accordingly try to rationally plan leadership and organizational design and to control their outcomes as far as possible,
- make use of a primarily rational, functionalistic and more or less linear logic in order to achieve this,
- preferably work with quantifying methods to investigate the factors which are relevant for leadership design.

In this regard, authors writing from practice and SAP perspectives usually argue that “traditional” and/or modern leadership research hampers a deeper understanding of what actually happens when and while leadership is actually being exercised. The table below illustrates the main divergences between conventional strategy perspectives and SAP approaches.

Table 1: Traditional (modern) leadership approaches and the surplus value of practice perspectives as viewed by the latter.

	Strategic Management research	***Practice Perspective***
(Concept of) Knowledge	Explaining the world, functionalism, normativity Knowledge represents reality (Representationalism) Claim: comprehensive explanation of the world	Knowledge is never complete and always a social construction → context has to be taken into account We can only know what actually happens (the doings of ...) Claim: Understanding instead of explaining
Overall world view	The world is like a clockwork with its own inner order and functioning. Our task is to understand its mechanics and make optimal use of it through adequate methods and technologies in order to build and shape it according to our aims. *building view of the world*	The world is constructed in a non-linear way. It is thus neither possible to completely explain it nor to plan and control its functioning and development. The latter are to a certain degree chaotic. *dwelling view of the world*
Basic epistemological position	Rationalism, functionalism, methodological individualism	Relationism, behavior is always embedded into a web of relations and practices and cannot be studied in an isolated way.

Research options	Structuralism or individualism/ voluntarism alternatively (structure/organization *or* actor oriented perspectives)	Both structures and actors are socio-cognitive constructs and can only be understood in their interrelations and interlacement Dynamics and processes of concrete action as it happens (the doing of strategy: who, what, how) Tension between substantialism and relationism
Research methods	Quantitative methods preferred Concepts of competence primarily envision quantifiable, technically measurable factors, causal relations, analyzing variables, linear causality	Qualitative methods preferred: qualitative interviews, (participant) observation, ethnographic methods, discourse analysis, phenomenology, hermeneutics
What is being analyzed? Perspective on social actors and organizations	- Actors as clearly identifiable and circumscribable entities and their strategic actions, understood as intentionally planned - Structures/organizations as clearly circumscribable and describable entities and their designing	- Bundles of practices inside of webs of relations - Consequences of spontaneous human actions, emergences, processes, dynamics - Actual strategic action, consisting of micro-activities, micro-practices of organizing (Weick) and micro-changes
Concepts and ideals of leadership and organization	- *Building view of the world* - Strategic decision making as a comprehensive, coordinated, actively designed process - Leader as a strategic planner/ top-down controller - Motivation of social action is derived from liberal ideology, for example from values like goal attainment and making profit - Specific forms of charismatic and heroic leadership are attractive - Predict and control, understood in a linear way, conscious designing of organizations - Working with intentions, goals and causal references of social action	- *Dwelling view of the world* - Strategy emerges unconsciously in everyday social action - Habitus, relational state of an “absorbed interlacement” with the world (cf. Heidegger, Husserl, Wittgenstein) - Motivation is a result of personal responsibility → focus on management education - Concepts such as charismatic leadership have to be disenchanted - Action in its coming into being, thoughts and emotions are observed neutrally, as well as the grey shades of everyday life

Sources: Gherardi (2010), Holmberg/Tyrstrup (2010), Jarzabkowski/Spee (2009), Vaara/Whittington (2012), Chia/Holt (2006).

So to what extent do the practice perspectives presented here as ideal-typical counterparts of traditional and modern approaches include crystallizing points of an innovative theory development on the basis of a critical reflection of existing research? In other words: To what extent are we dealing not only with a new and stylish academic “fashion” but with a perspective which offers qualitative improvements in the sense of a more adequate ontology and epistemology, including the potential to better grasp the complexity of reality? So to what extent are we facing a real progress in theorizing?

The Surplus Value of the Practice Perspective: What are the Merits of the Practice Turn?

A surplus value of practice perspectives as compared to classical and modern approaches to leadership and organization can be observed in several respects. The following section outlines a few important factors and elements illustrating a new and qualitatively deepened understanding of the phenomena observed.

Deeper Interest in and Understanding of the Relational Complexity of Leadership and Organizations

An important motivation of practice perspectives is to grasp, describe and understand organizational and leadership phenomena in their whole complexity in a more adequate way as it has been the case before. In order to do this they make use of a more complex concept of organization than classical and modern theories did. Now organizations are not viewed as hierarchical, more or less bureaucratically administered entities consisting of clearly describable (infra-) structures, positions and functional levels anymore, but as the sum of inner-organizational relations, as “a bundle of practices and material arrangements” (Schatzki, 2006, p. 1863) which constantly inform, change and renew them and have multiple interrelations with each other. Practice perspectives thus put a particular focus on the intertwinement of components such as social action, structures and “assemblages” of various material objects, which are analyzed as general arrangements, constellations or figurations (see also the configurational sociology by Norbert Elias).

At the same time, practice perspectives do not view leadership as unidimensional, linear phenomena anymore but rather aim at a thick description of the characteristics, problems and workings of everyday leadership. Leadership practice is of interest here precisely in its fragmented, non-linear and sometimes chaotic gestalt (Holmberg/Tyrstrup, 2010, p. 356).

For both the analysis of leadership and of organizations, the procedural perspective is central in practice approaches (Schatzki, 2006 and Holmberg/Tyrstrup, 2010 speak of a “fundamental priority of processes”). It stresses the strictly social and collective nature of leadership and organizations, as well as the temporal and spatial dimensions of concrete phenomena and constellations. Practice perspectives on leadership and organization can thus be summarized as focusing on “doing leadership as a practical activity in complex organizations” (Denis/Langley/Rouleau, 2010). Insofar as this constitutes a considerable differentiation of the perspective of analysis as compared to modern understandings of leadership and organization, the PT offers a clear theoretical and epistemological surplus value. The Model of Hierarchical Complexity as a content-free framework for analyzing the structural complexity of actions and utterances (Commons, 2008) would most probably classify the traditional SM approach as a formal (stage # 10) concept while practice perspectives as contextual epistemologies are likely based on systemic (stage # 11) reasoning.[2] Therefore a crucial element of their epistemology is a systematic interest in the contextual, relational conditions of all social action.

Systematic Interest in Complex Contexts of Social Action

Due to their relationalism and their sense of complexity of concrete leadership and organizational phenomena practice perspectives have a different understanding of social action in general and of strategy in particular. Based on phenomenological descriptions of the world as proposed by Heidegger, practice perspectives aim at a more adequate "re-conceptualization of agency, action and practice and their interrelations" (Chia/Holt, 2006). Gherardi (2010) and others stress that the central goal of practice-based studies consists in explaining the "doing of strategy" out of the interrelations between practice and their respective context.

More specifically, theorists of practice use a concept of strategy based on the social nature of all action, in result of which the latter cannot be understood as conscious, intentional goal attainment anymore, but rather as a behavior embedded in social contexts from which alone it can be understood. Some authors also draw analogies with rituals or liturgies, for example in Vaara/Whittington (2012).

Through its interest for the workings and the constitution of agency within a web of social practices the practice perspective, as a relational theory, comes to a more differentiated understanding of "strategic" processes. While dynamic contexts of practice are revalued in comparison to structures, new theoretical resources are made accessible for the discipline of strategic management (cf. Vaara/Whittington, 2012). Practices are thereby conceptualized as complex, flexible and polyvalent phenomena with both social and material dimensions (Vaara/Whittington, 2012, p. 298). Since the practice perspective has a particular interest in the micro foundations of social phenomena, it also puts a special focus on discovering and reconstructing the processes of interrelation between all of those dimensions.

Different from ideal typical modern strategic thinking, attention is directed not (only) on the behavior of single individuals, but on that of networks consisting of meaningful interactions and their outcomes and materializations ("webs of practices") which are treated as dispositive in a Foucauldian sense. The latter constitute socio-cultural "operating systems," the socially constructed *modus operandi* of which on the one hand guarantees a certain stability, anticipatory reliability and consistency of social action. On the other hand it epistemologically does not need the concept of strategic planning in the traditional sense.

Two additionally important concepts are therefore that of *emergence* ("what is actually happening") as well as that of the "*dwelling mode*" as compared to the "building mode" which is at the basis of the traditional motivational understanding of strategy. The former, in contrast, describes a mode "in which strategy emerges non-deliberately through everyday practical coping"

---

[2] A more detailed discussion of the correspondence between the epistemological perspectives reviewed here and stages of complexity as defined by the MHC is beyond the scope of this article.

(Chia/Holt, 2006). This understanding presupposes a permanent changing and re-creating of contexts of social action. Their analysis – more so than that of acting in the classical understanding – thus figures in the center of studies based on practice theory. Their close relation to social theory and the analysis of power, as well as to discourse theory and analysis in the tradition of Michel Foucault is therefore not surprising. Foucault conceived of power as of the concrete nature of the contexts which enable or prohibit certain actions, which is why he analyzed the creation and change of similar contexts *in actu*. Foucault saw a key for explaining collective knowledge production, amongst them collective processes of learning, in how power is exercised in practice through designing and changing contexts of meaning (Foucault, 1982).

This concept is not only opposed to the idea of rational problem solving; the underlying contextual epistemology can also be characterized as more differentiated and thus more complex than previous theoretical perspectives. In view of our initial question concerning the epistemological surplus value of practice perspectives it can thus be argued that it combines micro and macro perspectives, individualistic and systemic (or field-specific) approaches in a hitherto unique way. Through conceiving both relations and networks, just as things, as prolongations of our possibilities of action ("dwelling with the object," Chia/Holt, 2006), it makes accessible new dimensions of knowledge, thereby clearly going beyond those offered in classical management studies.

Constructivism and a Higher Theoretical and Methodological (Self) Reflexivity

With its context sensitive, constructivist understanding of leadership and organization we observe a decentering of the research perspective and thus a higher degree of methodological reflexivity, as well as a corresponding (self) critical potential. Practices which had been taken to be self-evident until then are uncovered through the study of pre-verbal understanding by the practice concept, similar to what is practiced by the sociology of knowledge, these more subtle conditions of knowledge made accessible to critical analysis (Schatzki, 2006, p. 316). By relating practice and the contexts of knowledge in which practices are embedded – and which, vice versa, are brought about and changed through practices – a postmodern, constructivist concept of knowledge becomes the basis of empirical analysis. It is particularly interested in "hidden knowledge" influencing and canalizing social action without necessarily being conscious to the respective actors themselves in a specific situation.

By putting similar, systemically operating mechanisms into the center of attention, the degree of (self) reflexivity and thus the epistemological potential of research are improved considerably. Leadership is hence not only described in detail in its coming into being, but the "how" and the underlying mechanisms and dynamics are explained from a perspective which takes into account systemic relationships (Schatzki, 2006, p. 372). Thereby, if nothing else, certain *mental images* of the researchers themselves may come into the focus. For the definition of a social phenomenon (for example "gender") as a practice is of course also a construction (cf. Gherardi, 2010). Bourdieu has therefore proposed that a "sociology of sociology" and a "science of science and reflexivity" should be central concerns of a (self) critical sociology (Bourdieu, 2006). Compared to traditional concepts this must be considered as another step towards decentering the analytical perspective which, from an integral point of view, corresponds to the shift from formal to systemic thinking as conceived by the MHC (see above).

Inclusion of Inner Dimensions (Individual and Social Unconscious)

With the aim of bringing analytic light into unconscious processes and mechanisms, the PT also demonstrates greater attention for unconscious or pre-conscious inner and psychic dimensions of the social. For to grasp phenomena of leadership and organization in their complexity, and to experience "the complexity of an organization as it happens in real time" (Schatzki, 2006) also means to live instants, situative constellations and events as series of performative moments more consciously. Organizations are therefore conceived and perceived by practice perspectives as "taking place" (Gherardi, 2010) or as "occurring" (Schatzki, 2006). Hitherto unconscious dimensions and aspects are thus moved into the focus.

This kind of "thick" attention is directed both towards the individual, the social and the organizational unconscious – the two left quadrants in an integral model. In view of the individual unconscious, the PT's aim is to investigate dimensions like intentionality, identity, authenticity, vulnerability, self and autonomy in depth and in more detail (Caroll/Levy/Richmond, 2008). With the post-modern world view inspired by Heidegger's concept of "Geworfensein" (being thrown into the world) and being-in-the-world, most practice perspectives also demonstrate, on the one hand, a greater attention for other than merely rational competences, intelligences and modes of being, amongst them emotional, interpersonal and spiritual ones. On the other hand, the analysis of the inner realms of the individual calls for a more precise examination of cognitive processes as they really occur in the context of perception and experience, interpretation and meaning making, as well as a clarification of how which activities are coordinated in what way. In the context of the PT this often happens through qualitative (see below, section on qualitative methods) and quasi-phenomenological case studies or through "thick descriptions" (Geertz, 1973, Holmberg/Tyrstrup, 2010).

With respect to the social unconscious, practice perspectives aim at making structural sets of everyday practice intelligible as "organizational memory" (Halbwachs, 2004) or as habitual "modi operandi" (Bourdieu). In approaches inspired by Halbwachs, organizational memory is understood as a "social version of mind," as the consciousness of organizations in which memories about "how to do things" are stored. In this context Schatzki (2006, p. 1867) mentions four elements of the "memory of practice": general understanding, practical understanding, rules and teleological structures. For social actors to grasp similar sets of practices as structures it is important to have a personal experience with respect to how stable and thus how influential the respective rules of "doing things" are in everyday contexts. For, as Chia/Holt (2010) have stressed, the functioning of unconscious dispositions of thinking and doing depends on the experience of inner consistency of action in line with past experiences.

In contrast, approaches inspired by Bourdieu emphasize the habitual components of social practices. The latter function as structured dispositions, similar to the concept of "space of possibility" described by Foucault (1999), framing concrete practices in the sense of a de facto functioning operating system (as a "modus operandi enabling actors to mindlessly cope with unexpected and changing situations)" or even keeping them "trapped" (Chia/Holt, 2010, p. 645). With this implicit embeddedness (mostly unconscious to social actors themselves) they provide a certain continuity and stability of the social, also described as “social inertia” by Chia/Holt (2010).

The question how similar socio-cultural dispositions or socio-cognitive operating systems (which we as participants of social spaces of communication need in order to function within those spaces) come into being in the first place is of particular interest in both approaches. So how does consensus about the meaning of certain concepts, terms, cultural values and guiding principles arise at all? How are collectively shared criteria of good leadership attributed, for example? In order to reconstruct the processes through which specific meanings become dominant or even hegemonic, change or transform, a leadership research guided by this conception of practice has to work in a discourse analytical way. According to Chia/Holt (2010, p. 765), it needs to focus on the dynamics and the power relations between competing discourses and their interrelations.

So the inclusion of the dimension of the unconscious does represent another enlargement of perspective in the sense of a higher epistemological complexity as compared to strategic management approaches (where it is hardly present or not at all). However, the overall relation between consciousness, individuality and their social conditions of existence ultimately remains unclear in most practice theories (see critique below, general evaluation). Even though the need to create consistency and congruency of action with past experiences is claimed to be a functional and necessary quality of consciousness, many authors also try to “get rid” of the dimension of consciousness by using alternative concepts such as *habitus* and *Strategy-as-Practice*. In fact, in some texts it appears as if consciousness was considered as a kind of black box that cannot be fully explained and is therefore treated skeptically (Knights/Wilmot, 1992, also Chia/Holt, 2010). Instead, concrete coping strategies observed in the context of social practices are explained as “practical wisdom” and claimed to be simply transferred “silently from body to body” (for a critique see below).

Working with Qualitative Methods

In the course of this shifting of theoretical and epistemological preferences from the “building” to the “dwelling mode,” from “strategy in the center” approaches to “strategy-as-practice (SAP)” ones with their focus on inductive and explorative approximations to concrete real processes, inner worlds, grey shades and improvisations, working with qualitative social science methods understandably becomes more and more important. Even though the complexity of concrete leadership phenomena is indeed difficult to “thickly describe” due to its multi-dimensionality as Caroll/Levy/Richmond (2008) have correctly noted, qualitative methods such as in depth interviews, participant observation, phenomenological, ethnological or discourse analytical methods are very well suited for doing thick descriptions of external, inner-organizational, as well as of inner, psychological processes and developments. Since qualitative methods focus on understanding (instead of causally explaining) what they analyze, they can help to reconstruct nuances and qualities of engagement and of relations with oneself, with others and with the (organizational) world. Also, the question “how agency is constituted in a web of social practices” can be answered in a methodologically adequate way. On this basis, Vaara/Whittington (2010) are right when they note that qualitative approaches provide “new theoretical resources to strategic management” and contribute to a better understanding of strategic processes.

As a matter of fact, the large number of qualitative case studies in the field of SAP research is striking. An important part of them is working with thick descriptions. With regard to data generation, participant observation, life case descriptions, discourse analysis and action research, SWOT analysis, interview studies (among them group interviews) and self-reflections (for example through diaries of managers; Vaara/Whittington, 2010, p. 293ff.) are the dominating choices. Thereby, the respective approaches try to reconstruct and to understand the reality of life and work of managers and leaders in organizations, as well as their strategies of meaning making *in actu* (for more examples see Gherardi, 2010, p. 120 and Holmberg/Tyrstrup, 2010).

As a mode of analysis, building types, for example when (re-) constructing typical narratives about how leaders view and evaluate their own work, is equally typical for qualitative approaches within the practice field. It is not surprising that in this context, traditional stories of heroic management, i.e. of omnipotent managers in control of every detail in their organization slowly gives room to stories of artists of improvisation who move within and through the everyday jungle of chaos and contradicting challenges in really existing organizations more or less successfully and often rather intuitively. Holmberg/Tyrstrup (2010) have coined the term “well then what now?” for this post-modern managerial *habitus* which can often be found in contemporary organizations. So in this regard, we can equally state a differentiation and thus, an epistemological enrichment of our current image of leadership in/and organizations.

General Evaluation, Achievements and Limitations

So how can the Practice Turn within leadership and organization research be evaluated from an integral perspective, based on criteria such as a holonic understanding of inter-relationalism and emergence, cross-quadrant multi-perspective and multi-method inquiry and developmental complexity? At this point, I wish to recall that the present considerations do not claim to give a comprehensive evaluation of the entire field of practice studies but simply discuss some of the limitations in much of the literature reviewed for this article which appear to be quite obvious done from an integral perspective. One of the aims of this critique is to highlight the surplus value of more integral conceptions of leadership and organization as compared to post-modern ones such as the practice perspective. This can of course only be done in a summarizing and exemplary fashion. Note that some of the following observations and critiques have also been voiced by authors from the field of practice studies themselves as suggestions for future research.

As stated before, the practice and SAP approaches discussed earlier provide a very valuable broadening of research perspectives bringing new, hitherto neglected dimensions of leadership and organization into the focus of analysis. Due to this clear epistemological surplus value and the corresponding greater cognitive flexibility they deserve the label of a “turn.” In the changes of perspective brought about by the practice turn, a number of typically postmodern claims, approaches and concerns are translated into concrete research. As a matter of fact, through the concept of practice, this happens in a quite focused way. However, the perspectives used by many practice approaches still remain under-complex in several respects and could be further developed and differentiated in view of the challenges posed to leadership and organization in a context of global interconnectedness.

Process(ual)ism and Relationalism as New Absolutisms: Throwing out the Baby with the Bath Water?

Even though the PT by its relational perspective and its attention for micro processes does make accessible new and important additional dimensions of analysis, as outlined before, it is in danger of “overshooting the mark” and to throw out the baby with the bath water, just as other theoretical innovations in the past. Certainly, the PT’s insight is correct that leadership activities inside organizations cannot be explained exclusively by the intentions of the leaders (as it is done by methodological individualism), as well as its own claim that leadership phenomena are embedded in multiple relational contexts and webs of relations conditioning and influencing their concrete coming into being. At the same time, some theorists of practice seem to conclude from this that everything has to be dissolved analytically into the relations constituting it. With the dissolution of the opposition of structure and agency, the category of social action itself seems to be dissolved in some cases, getting lost in complex contexts.

Furthermore, in the more radical forms of relationalism the idea of entities is principally considered as epistemologically outdated. Schneider (2013, p. 13) mentions the field of International Relations as an example, in which authors like Jackson and Nexon (1999) have claimed a priority of “relations before states.” Schneider therefore asks to what extent nation states can be (analytically) dissolved into webs of relations. Even if it appears epistemologically meaningful and interesting to think of and analyze international relations *as relations* that are subject to constant change, existing collective entities such as states do not become obsolete by this (see also Bunge, 2000). Rather, we can historically observe how the relevance and importance of particular entities changes, often in result of a change of their interrelations. Consequently there have been “complexes of relations which had a transformative impact on their relata and brought into being new relata,” as Schneider (2013, p. 14) notes – and vice versa. So instead of puristically replacing one by the other (“relations without relata”), both concepts (as cognitive constructs and systems) and their interrelations should be studied in their respective dynamics. Viewed from an integral, developmental epistemology, this could be called a meta-systematic exercise.

Even if the shifts of focus from the “building” to the “dwelling view” might engender new insights, there is a certain danger of a new absolutism and thus, a new reductionism if the dwelling perspective is give the ontological status of a “fundamental priority of processes” (Nexon, 1999, also Schneider, 2013, p. 10), while the principal heuristic value of non-processual categories such as entities is negated. For a discussion of this danger see also the discourse on “processism” in De Cock and Sharp, (2007, p. 246). From an integral perspective, discovering the importance of processes and relations does not render individuals, actors and entities (as the underlying relata) superfluous. Rather than calling for an ontological either or choice between them, a more (self) reflexive, developmental and holonic perspective would come to see both views a complementary approaches, both contributing to our knowledge and understanding of complex phenomena and their dynamic interrelations.

Descriptive Bias, Overestimation of Externally Descriptive Perspectives, Lack of Theory

Another potential bias of the practice perspective is linked with the reductionism mentioned before. As noted before, the PT does offer increases in complexity as compared to classic SM approaches. However, this is true mainly in the sense of a "horizontal" differentiation. For even if the relational – as a systemic – perspective opens up new dimensions of knowledge, it does so, for the time being, primarily via thick descriptions of micro level processes and phenomena. Although it claims to *explain* practices via relations and their interactions (Jarzabkowski/Spee, 2009), many approaches de facto remain in a comparatively descriptive mode. Besides the prominent interest in the micro foundations of social practices, this is especially true for the PT's treatment of the inner dimensions of social and relational processes. The latter are – on the one hand –mainly addressed via, and thus reduced to their behavioral aspects (upper right quadrant in an integral model). An example is Chia/Holt's (2010) claim that social action was unreflected and "mindless" while it actually happens, and that therefore what has actually happened – and, my addition: what has been thought along the way could only be reconstructed retrospectively. By conceiving routines as largely unconscious practices, which mostly become objects of reflection only through failures, disappointments, counterproductive results or a "breakdown of organizational functioning," the actor's consciousness is treated analytically as a more or less irrelevant dimension. And while some authors do focus on sub- or unconscious and other inner psychological states (e.g. Yiannis Gabriel, 1999, and other psychoanalyst oriented scholars), the structural dimension of consciousness development seems to be absent even in practice approaches that are aware of genetic epistemology, autopoietic systems theory (Grand/Rügg-Stürm/von Arx, 2010), or that focus, for example, on identity change and its impacts on leadership (Johnson/Balogun/Beech, 2010).

So even though practice perspectives with their idea of "beings engaged in exercise" aim at solving the "eternal problem of structure and agency" (Miettinen/Samra-Fredericks/Yanov, 2010), the concept of "prolonging our possibilities of action" through "dwelling with the object" (Chia/Holt, 2006), including material arrangements (Schatzki, 2006), mainly targets external dimensions of social action, while inner subjective and psychological factors largely stay out of the focus. In this respect, the approach is not dissolving the Cartesian subject-object dualism, as argued by Miettinen/Samra-Fredericks/Yanov (2010), but rather represents a material and contextual "prolongation" of the concept of social action. An integral approach, in turn, would propose to transcend the idea of a subject-object dualism by a comprehensive, complementary conception of subjects and objects as entities that are interrelated in multiple ways.

When inner dimensions of social actions are being illuminated mainly by questions such as "how actors construct themselves" or "how classes of actors perceive what they do" they are thus merely reconstructed in a primarily descriptive way. At the same time there is no theoretical model for explaining the respective perceptions and cognitive constructions. The individual – and in particular its relations – are indeed objects of study (Holmberg/Tyrstrup, 2010). The individual's role as subject of knowledge and insight in its own right, however, remains underexposed or at least theoretically unreflected by limiting the analytical perspective to its embeddedness in specific contexts.

So even if the PT has led to a considerably higher appreciation for qualitative methods, it lacks a resilient theory for actually explaining individual and collective/organizational inner dimensions in a solid and reliable way. The fact that the PT seems to shy away from a more thorough analysis of those inner dimensions – which nevertheless play an important role for the coming into being and the exercise of concrete practices and routines – could be linked to another bias:

Blind Spot: Consciousness (Psychic Structures and Entities)

As mentioned in the previous section, many theorists of practice systematically assume a priority of actions *before* mental representations. On this basis, their tendency to abandon actors as theoretically relevant entities seems consistent (even though actors are perceived as living beings with emotions, motivations, intentions etc.). This happens in favor of descriptions of concrete actions informing a modified concept of strategy. The latter conceives of strategy as consisting of and coming into being through physical being-in-the-world and bodily interaction with the world which are clearly understood as “primary in comparison with knowledge and cognition” (Miettinen/Samra-Fredericks/Yanov, 2010, p. 1313). Sometimes social action is also conceived as “coping” in the sense of a flexible “responsiveness to a situation as it unfolds.” A psychological component, in contrast, is not envisaged within the practice perspective, at least not as a systematic part of its explanatory model. Here we can well state a certain contradiction with its principal plea for integration of unconscious factors, multiple intelligences and competences.

Therefore, the inherent danger practice perspectives are confronted with, given their concern to transcend strategic and motivational perspectives by including contextual and habitual factors, is to “overshoot the mark.” In other words, they have to beware not to make their own focus on context and habitus absolute inversely. If Knights/Willmott (1992), for example stress the social and organizational dimension of leadership, the reader gets the impression that the authors are looking for explanations which exclude the factor of “consciousness,” as if the latter were an outdated category the essence of which was better explained via external factors. Indeed, they stress that those embedding contexts of meaning which all acting individuals are part of, are not a denial of our individuality but their very condition of being. Nevertheless, the different aspects and components of individuality can be found on the analytic agenda only as products of social contexts of practice.

As a result, the relation between individuality and its social conditions of being, standing in the center of attention of practice theories, ultimately remains unclear. From an integral perspective, the strategy of rendering the dimension of consciousness dispensable – which seems to be feared theoretically and/or methodologically as a sort of black box which cannot be fully explained – or to define it out of the explanatory model (Knights/Wilmot, 1992, also Chia/Holt, 2010) creates several problems.

In this conception, practical competences are acquired solely through imitation of the behavior of others (this is called *practical wisdom,* Dreyfus, 2001, p. 48). This theoretical preference can be explained by the rather fragmented, non-linear and occasionally chaotic world view of post-modern theorizing (Holmberg/Tyrstrup, 2010), as well as by the strong assumption of the fundamentally contingent nature of the social. However, not every social practice and not every coping strategy can be considered to be “practical wisdom” just because it has been passed on “silently from body to body” (Dreyfus, 2001, p. 48, cit. after Chia/Holt, 2010, p. 649; for an overview of research on wisdom see the recent issue of Integral Review, vol. 11, 2). Viewed this way, practice research has to be understood primarily as a *research practice*, as a method for describing social practices on the basis of a specific theory and epistemology.

Unfortunately, in the context of this concept of practice theory, standards and criteria for evaluating *qualities* of social action within relations get lost, for example when networks and relations are solely described in a quantitative way, looking at and mathematically determining the number of connections in them, instead of looking for the implicit internal rules and systems of meaning which govern them. By the way, this dilemma has been indirectly conceded by Vaara/Whittington (2012) when they refer to specific orders of knowledge and the practices (re)constructing them as “source of cognitive bias,” in other words as sources of “false consciousness.” However, false consciousness should not exist as a category in a theory which treats consciousness as irrelevant and all contents of actors’ minds as equally valid (as quasi epiphenomena). Therefore the question remains open, what “right” or “correct consciousness” is and how this can be recognized.

In the mental realm of the practice perspective, based on the assumption proposition of a complete contingency of the social, the claim that social action cannot be explained “by reference to rules” is indeed coherent. But as soon as we include psychological and social-psychological factors into the analysis, it becomes clear that most “social operating systems,” *modi operandi* and forms of *habitus* (which also represent systems of rules) are much less contingent and arbitrary than practice theory claims they are. They can rather be explained alongside well known psychological mechanisms.

Discussion

So what are the main limitations and shortcomings of practice perspectives as compared to integral approaches to leadership, and in what way can the latter propose a more comprehensive understanding of leadership practices in organizations? Table 2 illustrates the main differences between post-modern (practice) and integral approaches.

Table 2: Post-modern (practice) and integral approaches to leadership.

	Practice Perspective	***Integral Leadership Perspective***
(Concept of) Knowledge	Knowledge is never complete and always a social construction → context has to be taken into account We can only know what actually happens (the doings of ...) Claim: Understanding instead of explaining	Knowledge is never complete and always subject to development, ideally towards more comprehensiveness; knowledge is subject to processes of individual and social construction which are framed by structures of cognition and culture
Overall world view	The world is constructed in a non-linear way. It is thus neither possi-	The world is a possibly emerging and regressing holonic entity consisting

	ble to completely explain it nor to plan and control its functioning and development. The latter are to a certain degree chaotic. *dwelling view of the world*	of interrelated holons in various dimensions and fields. These can be accessed and analyzed through multi-perspective, cross-field and cross-level methods and heuristics. *emergence view of the world*
Basic epistemological position	Relationism, behavior is always embedded into a web of relations and practices and cannot be studied in an isolated way.	Inter-relationism, social action is the result of inner and outer factors and systems of meaning making on individual, social and cultural levels, the inter-relations and developments of which have to be carefully studied.
Research Options	Both structures and actors are socio-cognitive constructs and can only be understood in their interrelations and interlacement Dynamics and processes of concrete action as it happens (the doing of strategy: who, what, how) Tension between substantialism and relationism	Relations and entities are complementary aspects of an integral holism of inter-relationality Dynamics of action and their structural and (inter) relational conditions Tensions between partial epistemologies are a productive expression of complementarity
Research Methods	Qualitative methods preferred: qualitative interviews, (participant) observation, ethnographic methods, discourse analysis, phenomenology, hermeneutics	Mixed methods research designs, integrated methodological pluralism
What is being analyzed? Perspective on social actors and organizations	- Bundles of practices inside of webs of relations - Consequences of spontaneous human actions, emergences, processes, dynamics - Actual strategic action, consisting of micro-activities, micro-practices of organizing (Weick) and micro-changes	Practices as composed of/constituted by - individual actions, as well as their conscious or unconscious motivations and driving forces - cultural foundations and influences (shared values and knowledge) as enabling and constraining factors - systemic embeddedness in (inter) relations, infrastructures and sets of resources
Concepts and ideals of leadership and organization	- *Dwelling view of the world* - Strategy emerges unconsciously in everyday social action - Habitus, relational state of an “absorbed interlacement” with the world (cf. Heidegger, Husserl, Wittgenstein) - Motivation is a result of personal	- *Facilitating the emergence of individual and collective intelligence* - the concept of strategy is replaced by holonic emergence - Social actors/members of organizations are both subjects and objects and have to be considered in a comprehensive way

	responsibility → focus on management education - Concepts such as charismatic leadership have to be disenchanted - Action in its coming into being, thoughts and emotions are observed neutrally, as well as the grey shades of everyday life	- Good leadership as a question of personal complexity development and intercultural competences - More traditional concepts of leadership and strategy are valid and meaningful in their own right in specific contexts while integral leadership aims at facilitating a maximum comprehensive approach serving the emergence of individual and collective intelligence

The holonic increase in complexity and thus, the epistemological surplus value of integral perspectives can be illustrated with regard to two interrelated aspects: ontology of holonic emergence and rather differentiated multi-level approach to developmental complexity and its implications on leadership in organizations. While one of the important achievements of practice perspectives is their ability to “thickly describe” (Geertz, 1973) practices, relational constellations and processes within the realm of leadership and organization, they fall short of systematically explaining the dynamics of their interaction. Based on the relativist ontology of the PT, the latter can only be done in a more or less arbitrary and thus incomplete way. In fact, this seems to be the reason why the concept of contingency – filling this gap – plays such an important role in post-modern theories.

Viewed from an integral perspective, the most important blind spot of the practice perspective and its contextual epistemology is that it limits itself to grasping mainly horizontal plurality and complexity, thereby misconceiving the fact that socio-cultural, just as cognitive “operating systems” can – as systems – also be differentiated vertically. Viewed this way, these systems also have the character of (invisible) entities which can be reconstructed analytically, namely functional or cognitive-cultural entities as proposed by structuralist developmental theories. Those vertically differentiated entities which integral developmental theory helps to understand as more or less complex holons might not determine all social action, but they do canalize and pre-structure it, speaking with Foucault, in a limiting or enabling way.

Even if they do this, for the most part, in a way that remains unconscious to the respective social actors, this does not mean that it happens arbitrarily. On the contrary, cognitive structures and systems operate in a rule-based manner which can be identified by trained observers. They can thus not only be described but also predicted in a theoretically relevant way (Kegan/Lahey, 2009, Fein/Weibler, 2014). Admittedly, we are dealing with psychic rules here, calling for a theory of mind as it is offered, for example, by the corpus of adult development theory. On this basis, different qualities of relations can, for instance, be allocated with specific degrees of cognitive differentiation or increasingly complex stages of personal, cultural or organizational development. Furthermore particular rules can be identified with regard to relational phenomena on specific levels of development, such as networks of patronage or corruption (on earlier stages), which would not be functional on other (later) stages of development such as in modern or post-modern organizations.

In fact, some authors rooted in the practice perspective like Schneider (2013, p. 9) acknowledge this fundamental limitation, for example when he calls for a consequent meta-perspective, just as integral approaches would do. At the same time, even though he occasionally concedes that the whole is more than the sum of the parts, he unfortunately associates the term "holism" with a simple collectivism in which "the whole determines the parts and where individual action is an effect of social structures and processes (Schneider 2013, p. 9). While he considers the relational ontology as being just as reductionist as a one-sided individualism or institutionalism, Schneider implies that a more comprehensive approach should transcend similar reductionisms. So while he rightly calls for a "moderate relationalism in which entities exist out of their own right," he does not provide a coherent model of explanation in this regard, just as practice perspectives in general. Structures of vertical complexity are lacking in this conception. They are not seen which is why there is no solid theoretical ground for explaining differences and mechanisms of functioning of specific relations and contexts of practice.

At this point, integral approaches go a large step further. By systematically integrating the dimension of consciousness in its structural, vertical complexity into their epistemology, concrete processes, relational constellations and dynamics of leadership and organization can be understood as results of a holonic interplay of horizontal *and* vertical structures, inter-relations and entities, in other words as holonic inter-relationalities. Moreover, a comprehensive integral understanding of practice shows how practices in organizations holonically comprise processes and structures that are simultaneously autonomous and dependent, characterized by differentiation (generation of variety) and integration (generation of coherence). It looks at them as constituted by individual and collective holons, each with their insides and outsides, either tending to a more 'subjective' or a more 'objective' identity. Integrating the inner psychic spheres and the external, behavioral aspects as well as the corresponding collective embedment within an organizational community and culture along with the external structural-functional realms allows to relate and assess them together in view of a multi-domain, cross-level and cross-quadrant analysis of social practices and their changes and developments in organizations (Küpers/Weibler, 2008, 447). More so, on the basis of a more differentiated understanding of those interrelations, they can also be actively constructed and configured more successfully. Relations and entities are thus coordinated as equally important systems and tools of explanation in a meta-systematic way and combined towards a new paradigm of holonic inter-relationality.

Thereby, integral approaches to leadership and organization, as compared to post-modern ones not only offer an epistemological, but also a considerable practical surplus value in view of their application and implementation in real life leadership contexts and challenges. They therefore constitute a paradigm shift in the field of leadership and organization studies which might still be marginal as compared to the current (mainly post-modern) mainstream in the field, but are likely to gain momentum in the future. Therefore, it is not surprising that integral and developmentally based approaches are increasingly received and used within the field of leadership and organization studies (Bradbury, 2003, Cacioppe/Albrecht, 2000, Cacioppe/Edwards, 2005a and 2005b, McCauley/Drath/Palus/O'Connor/Baker, 2006, Lucas, 2012, Pauchant, 2002, 2005, Prewitt, 2004, Reams, 2005, Rooke/Torbert, 1998, Vincent/Ward/Denson, 2015, and Volckmann, 2005).

Conclusion: Transcending Postmodern Relationism through Integral Inter-relationality

So what can we conclude from the previous discussion of the merits and limitations of practice approaches to leadership studies based on an integral perspective? Given the theoretical preferences and the analytic qualities of approaches inspired by the Practice Turn discussed above, the latter appears as a rather typical post-modern theory perspective. Considering its interest for the workings of communication in a plurality of contexts, and for the many faces of micro functioning of relations and systems through embodied sets of practices, its epistemological features and complexity clearly transcend the formal and rather linear logic (MHC stage # 10) of modern science. Therefore, it can probably best be explained as a form of systemic thinking in terms of stage # 11 of the Model of Hierarchical Complexity (Commons, 2008). For even though practice perspectives largely propose an antifoundational and relativist ontology, skeptical of comprehensive models of social order, they do look out for complex webs and systems of relations which explain social action as it happens.

Indeed, similar variations of systemic thinking represent the current epistemological state-of-the-art in much of mainstream social science, including leadership and organization studies. For example while, practice theorists promote to combine a large number of different perspectives and subject positions, and thus, a certain epistemological pluralism ("practice-based and institutional level analysis can complement each other;" Jarzabkowski/Spee, 2009, p. 89), they usually do not make a step towards a cross-paradigmatic epistemology and research. This, in turn, would require a meta-systematic perspective and mode of inquiry as described by stage # 12 of the MHC and above, which coordinates various systems with each other from a higher level of abstraction and is thus able to illuminate the inherent, mostly implicit structures and rules of functioning and meaning making by which particular systems are governed. This meta-systematic view is mostly missing in practice perspectives, as well as in large parts of the social sciences to date. However, the increasing attention for developmentally informed approaches is a good sign.

‘Inter-Bridging’
Bridges and Bridging as Metaphors for ‘syn-integrality’ in Organization Studies and Practice

Wendelin Küpers[1], Jürgen Deeg[2], Mark Edwards[3]

Abstract: By interpreting the bridge as a relational metaphor, and reflecting an inter-relational ‘space between’ of positions, the paper contributes to a different view of integrating pluralism in organization studies. Following an embodied realism, first bridges and bridging are presented as phenomena, media and metaphors for connecting and separating. Showing their ambivalent character the role of bridges as metaphors and metaphors as bridges are discussed in relation to organisation studies and as transition zones for paradigms. Based on an integrative orientation, mediating qualities of bridges and bridging are outlined for gaining a decentered, but interconnected understanding of organising. The final part discusses some implications for organization studies.

Keywords: bridges, bridging, embodied realism, integral, metaphor, relational.

[1] **Wendelin Küpers** is Professor of Leadership and Organization Studies at Karlshochschule International University in Karlsruhe, Germany. Combining a phenomenological and cross-disciplinary orientation, his research focuses on embodied, emotional, and aesthetic dimensions of integrative organizing and managing. In his current research and teaching he is focusing on more responsive, responsible and practically wiser forms of organizations and management/leadership that are contributing towards more integral and sustainable practices.
wkuepers@karlshochschule.de

[2] **Jürgen Deeg** is long-time senior research fellow at the chair of business administration, leadership and organization at the University of Hagen (Germany) and works within the field of business administration, leadership, organisation and human resource management. After having studied administrative science at the University of Konstanz he earned his doctorate in business administration at the University of Hagen. For years he is also lecturing in different programmes of continuing education at various German tertiary institutions.
juergen.deeg@fernuni-hagen.de

[3] **Mark Edwards** is a tenured lecturer and researcher at the Business School, University of Western Australia. He teaches in the areas of business ethics, sustainability and organisational change. Mark has published on a diverse range of topics including business ethics, sustainability, organisational transformation, management education, futures studies and metatheoretical research. Current research and teaching interests include the integration of scientific knowledge to address global issues, the ethics of climate change, alternative understandings of economic growth and metatheoretical research.

SOME RIGHTS RESERVED

> Man is a rope, tied between beast and overman – a rope over an abyss. A dangerous across, a dangerous on-the-way, a dangerous looking-back, a dangerous shuddering and stopping. *What is great in man is that he is a bridge and not an end*... (Nietzsche, 2006, Prologue §4)

Introduction

Metaphors using the notion of bridges and bridging have found some favour in recent organisational research (Risberg and Elsmore, 2011). In a broad sense, bridges can be understood as forms of transferring and mediating movements across space, time, contents and contexts. Metaphorically, they are two-way vehicles of transport simultaneously connecting and disconnecting, embedding and disembedding people as well as concepts and issues. Hence they are an apt means of approaching or analysing multifaceted and controversial topics; specifically, as the openness to two opposite sites or directions is a constituent feature of all bridges.

As a consequence, the field of management and organization studies (MOS) can benefit significantly from the metaphor of the bridge and the notion and motion of bridging particularly with regard to the field's often noted state of fragmentation. As with other branches of the social sciences, MOS is characterised by various main- and side-streams that flow through often discontinuous whirls of fragmentation. Accordingly, there is persistent burgeoning of pluralisations with regard to views, concepts, styles, theories and paradigms that exist side-by-side or which compete with each other. This pluralizing process has been pervasive in organization studies for several decades (Knudsen, 2003; Willmott, 2008). The permanent proliferation of positions impairs the emergence of a commonly accepted integrated body of knowledge. As Okhuysen and Bonardi note there is a tendency in MOS research "to create isolated silos of knowledge that reflect specialization" (Okhuysen & Bonardi, 2011, 6). Yet this contested multiplying of positions also stimulates many fruitful insights that otherwise might not be gained.

Included in the divisive pluralism-integration discourse are debates, for example, between the proponents of incommensurability or combination, between isolationists or integrationists positions (Gioia and Pitre, 1990; Kelemen, 2007; Scherer and Steinmann, 1999) and between paradigmatic and meta-paradigmatic perspectives (Hassard & Cox, 2013), which, all too often, are not resulting in the development of research collaborations or communications.

Corresponding to the pluralisation also a fragmentation of knowledge and related lack of integrative research has been frequently acknowledged in the social sciences over the years (Goertzen, 2008). Already four decades ago, Whitely commented on the, "highly divided and fragmented nature of much contemporary research" (Whitley, 1976, pp. 480-481). More recently, authors have noted the fragmented nature of research in organisation and management studies (Donaldson, 1998; Thomas, 2003). This fragmentation not only hinders research through academic siloing and lack of communication but impacts on how organisations and communities address their multiple challenges (Bhandar, 2010). Fragmentation in science is an unintended outcome of two basic and valid motivations: The first is the goal of greater specialisation and detailing of knowledge. The second is to retain, what Stiglitz (2000) refers to as, "the localisation of knowledge." Where specialisation is quests after an ever more detailed causative understanding of phenomena and, hence, is accompanied by instrumental, technical and methodological specificity, localisation is associated with the respect for local ontologies and the recognition of unique qualities of each subject of study. While these are worthy motivations, when not complemented by integrative ends, they can result in problematic forms of fragmentation.

Hence, the modern and postmodern currents within MOS, as well as social studies in general, are characterized by a prevailing mixture of concerted positivist specialisation and postmodern localisation of MOS knowledge. These are based on and bound to particularised ontological, epistemological and methodological assumptions, orientations and reductionisms. Facing this situation, it is contested whether MOS can be enriched by further de-differentiating and disentangled pluralising or deconstructionist approaches without complementary forms of integration (Küpers and Edwards, 2008). Under these circumstances the current status of MOS requires new ideas on how different schools of thought can be juxtapositioned and/or interrelated more creatively.

Working at the interstitial boundaries of these integrating and pluralising forces, this paper outlines a ‘third way’. Taking the bridge as a metaphor and symbol of the constitution of relations and enabler of possible ‘meetings,’ the following argues for an integral pluralism in organization studies. Based on a post-dualistic, holonic approach (Edwards, 2005, 2009), we will outline specific integrative, or what might be called ‘syn-integral,’ qualities of bridges as mediating new possibilities for connecting MOS research paradigms and literatures. Following integral pluralism (Bhaskar, 1987; Dallmayr, 2010), by syn-integral we mean the synthesising of integrative connections to accommodate the diversity of perspectives towards a research topic.

Against this backdrop, the paper will be structured in the following way. Firstly, bridges and bridging are presented as phenomena, media and metaphors for connecting and separating. Showing their ambivalent character, the role of bridges as metaphors and metaphors as bridges are then discussed in relation to organisation studies. Following a holonic approach that takes part and wholes together, and a ‘syn-integral’ interpretation, perspectives on ‘inter-bridging’ and movable bridges are then described for gaining a decentered processual understanding. Finally, some implications for organization studies and conclusions are offered.

Bridges/Bridging as Metaphors for Connecting and Separating

In the first place, a bridge is a construction, something that is purposefully built and which can be perceived not only as a continuation of a road but as a place serving a special purpose on the road. It is continuing a path across that which divides. By changing the road or the landscape it produces a specific place and emplacement. While bridges call to mind divisions, they also allow divided sides to be seen as connected. In its figurative sense, the bridge attracts, connects, unites, and thereby creates a feeling of relatedness. This linking can also be fragile in character as bridges can be flimsy, temporary and act as points of division. In addition to connecting separated phenomena, due to practical needs and social functions, bridges also obtain specific cultural and aesthetical values. Thus, as an appearance it manifests not only as an artefact, but is encumbered with symbolic meanings and aesthetical qualities (cf. Simmel, 1994). Becoming a placed and visually perceivable image of time and space, bridges hence make the intangible accessible. However, perceiving a bridge always shows the division that it bridges. This interdependency of functions and forms may explain the power that bridges and bridging evoke as media and metaphors, expressed in such a way that they can be even felt on an embodied level.

As an embodied experience, bridges can be perceived and interpreted differently however. Depending on whether they are seen from afar, when reaching or leaving, standing on, or being under or moving on it, on foot or in a car or a train, they open different horizons. Various interrelated senses, who 'make sense' (Küpers, 2013) participate in sensual and aesthetic perceptions of a bridge. Experiencing bridges in an embodied way not only provides a passage-way but are part of being in an embodied place. According to Heidegger (1993), bridges are places that permit to experience the uniqueness and unity of space. They allow us to feel that we belong and can enter as well as how to dwell and live in a placed world, while also initiate different socio-cultural patterns, forming a specific locale and create connecting "networks of long-distance traffic, paced and calculated for maximum yield" (Heidegger, 1993, 354).

However, this archetypical, somewhat adoring interpretation of pre-modern bridges by Simmel and Heidegger can be insufficiently interpreted as not covering further possible forms and functions for our contemporary world. Their metaphor and interpretations of the bouldered bridge can be misunderstood as romantic image of crossing comfortably small rivers or streams.[4]

Today, large railway bridges, highway viaducts or huge suspension bridges break the landscape not only horizontally, but also vertically. On modern bridges humans are often lifted out of the landscape, separating them from it, and thus alter perceptions. Accordingly, bridges in our post-industrial times can also be seen as a metaphor of an ever increasing and pervasive mobility or the perplexity of different conditions of mobile possibilities (Strohmayer, 2010). This "interconnected nomadism" functions then as a means of developing multiple and transverse ways of bridged thinking and living. In this respect, the internet represents a kind of 'cyber-bridge,' which connects 'real-virtual.' For example, crossing via hyperlinks as virtual bridges creates an entry into home- or webpages, which are powerful electronic worlds in their own right. In the absence of direct, but vicarious experiences within virtual organizing, images and metaphors become particularly influential by structuring the reality of virtuality (Schultze and Orlikowski, 2001). The simultaneity of separation and/or connection (Kolb, 2008; Kolb et al., 2012)[5] and extended understanding of bridges as metaphors are a crucial for the study of organizations.

---

[4] Heidegger has been accused of being provincial and even reactionary in his choice of the old country bridge that "brings wagons and horse teams to the surrounding villages." But Heidegger also referred to a highway bridge "as is tied into the network of long distance traffic, paced and calculated for maximum yield," thereby not only disclosing the haste and efficiency of the essence of technology, but also exceeding that imposition in the way it brings into presence (cf. Heidegger 2001, pp. 152-153).

[5] Kolb defines connectivity as 'the mechanisms, processes, systems and relationships that link individuals and collectives (e.g. groups, organizations, cultures, societies) by facilitating material, informational and/or social exchange. It includes geo-physical (e.g. space, time and location), technological (e.g. information technologies and their applications) as well as social interactions and artefacts.' (Kolb, 2008, p. 128). As Kolb (2008) has outlined, especially the concept of connectivity is being increasingly used as a metaphor for intra- and inter-organizational interactions. He shows, that `connecting' and 'disconnecting' suggest an underlying theoretical duality, which can be described across multiple dimensions. According to Kolb the specific attributes which constitute the qualities of connectivity – namely latent potentiality, temporal intermittency, actor agency and unknowable pervasiveness – also explain why this metaphor has an appealing resonance with contemporary organisational life.

[6] Kolb defines connectivity as 'the mechanisms, processes, systems and relationships that link individuals and collectives (e.g. groups, organizations, cultures, societies) by facilitating material, informational

Bridge as Metaphor – Metaphor as Bridge

Referring to the Greek origin "*metaphorikos*" – from the Greek roots "meta-," (beyond, across) and "pherein" (carrying over, or bearing), i.e. meaning transportation – metaphors are marking and making movements visible. Basically, metaphors are ways in which terms that originally apply to one domain are projected onto another domain in order to structure experience in a new way or to create an extended awareness.

Metaphors can be seen as part of developing a symbolic understanding (Cassirer, 1955) and vehicle for meaningful organising and communication in and with the world. In particular, drawing upon symbolic constructs helps to approach the relationship between subjective and objective worlds. As part of analogical reasoning, metaphorical thinking is a basic mode of symbolism that is a creative form effectuated through using and crossing of images. Metaphors give form to and transform or generate as well as mediate new meanings. As structuring and creative forming they constitute a capability for processing, comprehending and expressing embodied experiences.

Furthermore, a metaphor is a way of seeing a thing *as if* it were something else, thereby providing a bridge between two dissimilar domains (Lakoff and Johnson, 1980). Consequently, metaphors can enable bridging between abstract constructs and concrete things (Ortony, 1979) and between the familiar to the unknown (Hawkes, 1972). Likewise, bridges allow transverse movements from one distinct area to another. This refers to a crossing that relates to a fundamental spatial navigating in the world in which we live. By synthetically relating areas that would otherwise be separated, bridges are compelling communication media, philosophically as well as practically and bodily. This is why metaphor and theory building are so closely linked.

Lakoff and Johnson tell us that "metaphor is pervasive in everyday life, not just in language, but in thinking and action. Our ordinary conceptual system, in terms of which we both think and act, is fundamentally metaphorical in nature" (1980, p. 3). For them this metaphorical structuring has its basis in experience. "Metaphor is as much a part of our functioning as our sense of touch, and as precious" (Lakoff and Johnson 1980, p. 239). According to their 'experientialism' (1980) and 'embodied realism' (1999), all our abstract conceptualization and reasoning, as well as use of language that is our symbolic expression and interactions are tied intimately to our embodiment. Consequently, our bodily experience and embodied relating are constructing thinking, feeling, interpreting and acting through the bridging transfer of conceptual correspondences from experience to more abstract domains (Lakoff and Johnson, 1999).

Linked to image-schemes, metaphors are both constitutive of the structure of bodily experience, as well as emerge from the experiential (Johnson, 1987; Lackhoff & Johnson, 1999).[7] Met-

---

and/or social exchange. He shows, that `connecting' and `disconnecting' suggest an underlying theoretical duality, which can be described across multiple dimensions.

[7] Lakoff and Johnson (1999) state that complex or abstract metaphors are primary metaphors that bring two distant domains-source and target–into correspondence with each other. The source domain is usually more physical or concrete, while the target domain tends to be more abstract and complex. Further, the source domain is made up of our fundamental orienting concepts known as image schemata or primary (deep) metaphors. Image schemata are experienced at the corporal level by manipulating objects and moving the body in space and time. A considerable part of our reasoning stems from projecting bodily

aphors refer to an affective state that simultaneously invokes cognition, sensory and aesthetic responses. As one of their functions, an embodied metaphor translates an experienced reality into a perceptible ‘object’ that has emotive import as well as discursive contents. Additionally, this translational process is inseparable from the creative imagination that poetically co-creates the ‘object’. In this way, metaphors mediate novel and even transcending meanings, thus are not reducible to either emotive utterance or rational discourse. Processing a form of emotional and imaginative rationality, metaphors allow bridging the gap between subjectivist and objectivist myths (Lackoff and Johnson, 1980, 193). Correspondingly, bridges are grounded in embodied experiences of human beings, whose bodily movements are related to the sensed experience of bodily engagement with objects (Lakoff and Johnson, 1999). This link to the bodily dimension may explain why bridges are such powerful and political figures of speech, action and interpretation (Winner 1980) as well as for carnal organisation studies and practices (Küpers, 2015).

Metaphorical Bridges and Bridging in Pluralized Organization Studies

As metaphors generally play a central role in the development of thought and inter-individual sense-making, they provide also organizational members with an essential vehicle for expression and interpretation. They do so in particular in that they help to synthesize and integrate the complexities and ambiguities of organizational experience (Feldman, 1991; Inns and Jones, 1996). Furthermore, they allow the reframing of perceptions to “see the world anew” (Barrett and Cooperrider, 1990, 222). This inherently creative dimension of metaphors and stories may be the reason for the intensive use of metaphors in organization studies and their growing importance to research and theory building (Oswick et al., 2002; Cornellison et al., 2008). Part of the innovative potential of metaphors is that they remain incomplete, as they merely hint, suggest or imply and, by this, open up realms for imagination (Trice and Beyer, 1993, 99).

The use of metaphor in organization studies was initially inspired by the work of Morgan (1980, 1986), helping to overcome the dichotomy of the dominant mechanistic and organic approaches within the functionalist paradigm and revealing the impact of their taken-for-granted metaphors on theorizing. For Morgan (1980, p. 613), “an awareness of the metaphorical nature of theory may help to break down the false and restricting compartmentalization of inquiry and understanding which characterizes the conduct of modern organization theory.” Moreover, he believes that the use of metaphor enhances the “capacity for creative yet disciplined thought, in a way that allows us to grasp and deal with the many-sided character of organizational life” (1986, p. 17).

Despite of the impact and potential of metaphorical approaches for MOS, their appropriateness has been contested. Accordingly, Grant and Oswick (1996, pp. 3-6) have pointed out some positive and negative aspects of metaphors. On the one hand, metaphors have a liberating poten-

---

and spatial image schemata onto abstract concepts. These image schemata are flexible enough to take on any number of instantiations in different contexts (Johnson 1987, p. 25). According to their embodied realism, “the locus of experience, meaning and thought is the ongoing series of embodied organism-environment interactions that constitute our understandings of the world” (Lakoff and Johnson, 2002, p. 249).

tial, i.e. they help people to see things anew, re-interpret the known and facilitate learning. As such they can foster new experiences, experimenting and diagnosing, thus can serve as a valuable investigative tool. On the other hand, metaphors also have limitations (Morgan 1996, pp. 234-235; Ramos, 1978). For instance, they can be reified and used as ideological distortions, guiding users into biased directions. Particularly, coexisting incompatible metaphors can give rise to incongruences and conflicts among different fields within the discipline and various agencies, employing divergent metaphors for self-understanding, orientation, and direction (Sementelli and Abel, 2007, p. 659). Finally, their inherent ambiguity and imprecision renders it difficult to receive clear or precise results and evaluation of their effects.

Thus, metaphors always represent only "partial truths" (Morgan, 1996, 232), that may be biased or lack rigor, since they neither can be proved nor falsified. Nevertheless, metaphors create important insights into different organizational phenomena as they allow researchers to develop new meanings through an interactive process of 'seeing-as' (Cornelissen et al., 2005). For instance, the unique creative potential of metaphorical approaches has been shown in multiple studies on the role of metaphor in facilitating organisational change (Marshak, 1996; Pondy, 1983; Sackmann, 1989). Metaphors enable organisational actors to re-perceive reality in novel ways that can bridge the old state with the new. Or they are providing a bridge from the "familiar to the strange" (Pondy, 1983, p. 163), respectively to use something relatively unfamiliar. To take another example, ideas or images from evolutionary biology may spark new ways of thinking about something familiar like business strategy (von Ghyczy 2003, p. 89). Metaphors are highly relevant for change and movement in organisational settings as they influence social actors' mind sets, in terms of how and which thoughts, feelings and actions occur. In this regard, Heracleous and Jacobs (2006) pointed out that bridges serve as orientational metaphor. They revealed that spatial proximity symbolizes organizational relatedness or directional uniformity represents coherence as well as similarity in spatial level stands for a sense of belongingness or solid physical connections functions as symbol for smooth organizational relations. As bridges and bridging are related to such spatio-temporal dimensions and dynamics they offer a rich metaphorical linkage that is relevant for interpreting organisational life-worlds.

Metaphors mediate space both through imagery and the manners of reality-changing processing by changing language and recontextualising events (Waistell, 2006, 2007). In particular, bridges and bridging can be regarded as metaphorical mediators. Relationally, mediation is what stands, comes or moves between things that are seemingly otherwise separated or opposed. As metaphorical mediators, bridges are not only a static 'betweenness,' but are always already 'go-betweens' that is in movement. Therefore, the crossing-over of bridges and bridging refers to an intermediary function, which relates dynamically between contents and worlds. Consequently, bridges serve as a milieu or mid-place of communication (Serres, 1982). Ultimately, there is no message or communication possible without such a middling context or channel. In any dialogue there must be some form of contact, which enables the communication to take place. This can be material, for example a meeting-place, a postal service or a techno- and socio-material network as well as in immaterial forms as a discourse with rules. The middle or in-between can also be a combination of material presence and immaterial spheres, like a con-ference, which is literally a bringing or carrying together both at once. Thus, all the work of communication is a sort of bridge-work, made for the spanning of gaps or traversal of stances and distances. However, intermediated communications may also mean mistelling, mishearing, and misapprehending. These cases refer to mediations or practices of mediators in which biases, errors and distortions occupy, overrun or obliterate, thus rendering various interferences.

With new techniques and/or media of communicational bridges, organizational members are faced with a world without addresses that correspond to unique and determinate sets of coordinates in the physical world (Serres, 1994, pp. 205-206). Correspondingly, it makes more sense to look out for the bridge between two ends within a continuum, than to singular poles. The mediating qualities of bridges and bridging as generative metaphors yield new perceptions, interpretations, explanations and inventions in organisational practice (Schön, 1979, p. 259). In this way they are offering alternative ways of looking at an existing situation or possible conceptualisations.

During the last decades many researchers have been debating intensely whether the coexistence of many research paradigms has been beneficial or detrimental to the development of MOS. While the debate between proponents of unification or pluralism is not settled, there are disadvantages to an ongoing non-integral pluralisation. In particular, the field of pluralised organization studies is facing traps of specialisation and fragmentation (Knudsen, 2003, pp. 263-264). The *specialization trap* is a situation, where the further elaboration of dominant research programs suppresses the search for heterodox explanations. This strategy of exploitation provides faster and safer returns on efforts than the exploration of entirely new and hence uncertain areas. As a consequence, exploratory activities are rather scarce. In the long run, this limits a discipline’s potential to adapt to new and unpredictable situations and developments. The *fragmentation trap* is, in contrast, characterized by a constant search for and creation of new theories, methods and research topics rather than elaborating or extending existing ones. As a consequence, the pace of development is too fast to evaluate each contribution properly and to integrate new positions into coherent knowledge structures. Manifold activities of exploration may then lead to an arbitrary, haphazard accumulation of knowledge. Accordingly, new contributions are not integrated with the existing knowledge, as their relationship to other theories is not clearly connected or assessed. This undermines the potential to use existing positions for the development of innovative engagement and contributions.

This problematic status of theory calls for an integral reasoning and frameworks for bridging various positions in a more comprehensive way (Küpers and Edwards, 2008). When disjointed divisions and contestations prevail, generative metaphors, such as bridges and bridging as metamorphorizing activity, are helpful for enhancing a development towards integration. The following outlines some perspectives on how bridges can be transition zones for connecting paradigms from an integral pluralist or syn-integral orientation.

Bridges as Transition Zones for Paradigms

We have argued that any attempt to develop integrated perspectives has to deal with the problem of pluralism in MOS. Adopting a meta-perspective (Dewulf et al., 2009) is one important aspect for addressing this issue. As Goia and Pitrè remark: “Comparing and contrasting diverse paradigms is difficult when confined within one paradigm; looking from a meta-level, however, can allow simultaneous consideration of multiple paradigms and their transition zones” (Gioia & Pitre, 1990, p. 595).

The postmodern distrust of meta-positions is understandable given the problematic assumptions that often accompany such views, but the point put forward by Gioia and Pitrè is different. Their assumptions are of valuing pluralism or taking diverse meta-level positions and of retaining marginal views (Gioia & Pitre, 1990). Questioning the assumption that there are no connections between paradigms can open up re-searching for multiple overlapping or connecting areas (Gioa and Pitrè 1990, p. 592; Schulz and Hatch, 1996, p. 534). Such approaches would not try to fuse or merge, but to relate and negotiate between conflicting positions. They concern for example objectivist and subjectivist approaches or positivistic and anti-/post-positivistic orientations in organization research.

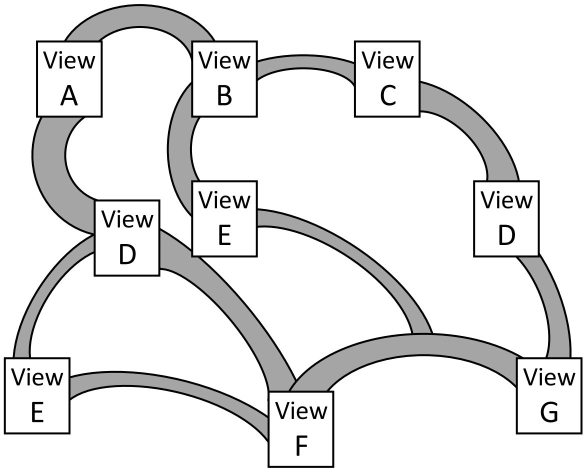
The adoption of a meta-paradigmatic perspective has three important implications (Dewulf et al., 2009, p. 180). First of all, it values separate paradigms as independent, yet fruitful and coherent perspectives. Second, the simultaneous consideration of more than one perspective offers chances for mutual learning, especially by revealing tensions as well as analogies, thus fostering new research questions. Third, concentrating on the permeability of paradigmatic borders and zones of transition can be detected, where different elements might be combined or reconfigured towards rendering novel insights or findings. An illustration of this threefold use of the bridging metaphor can be found in the work of Aram and Salipante and their article on “bridging scholarship in management” (Aram & Salipante, 2003). First they consider separate and contrasting research perspectives of the “particular and the general,” “experience and theory,” “the implicit and the explicit,” and “induction and deduction” (2003, p. 189). Second they develop new research questions and learning opportunities and explore “the potential for a philosophy of science and a process of inquiry that crosses epistemological lines by synthesizing [separate epistemologies]” (2003, p. 189). Third they develop bridging themes that retain but also reconfigure conceptual elements to develop new insights and “new communities of knowing toward the production of relevant and rigorous management knowledge” (2003, p. 189).

In order to (re-)construct such transitional zones, we propose an integral pluralism framework as a bridging concept. By this we mean, a bridging in which different elements or positions are not reduced or subsumed into each other. Rather, they are a seen as contributing their own insights to a more comprehensive understanding. This integral orientation permits bridging between paradigms as well as between micro-, meso- and macro-levels of analysis and their interplay. In this sense, bridging is a meta-theoretical integration practice that mediates between theories, concepts, findings, and interpretations. Consequently, integral bridging can link seemingly contradictory, opposed or divergent positions and perspectives by creating more comprehensive and revealing understandings. For example, Gioia and Pitre offer a kind of proto-integral bridging of the gap between the interpretivist and functionalist paradigms by stating: “In the interpretive paradigm, which presumes a subjective reality, we saw that theoretical discourse often takes place in terms of structuring. If any bridge is to be drawn with functionalism, which presumes an objective reality and, thus, objective social structures, some connection must be made between these concepts” (Gioia and Pitre, 1990, p. 592).

Holonic and ‘Syn-integral’ Bridges/Bridging

As has been argued, the bridge/bridging metaphor can serve as a powerful embodied tool for a more integrated understanding of pluralised organisation theory and practice. Building on this idea, we now outline some post-dualistic perspectives on understanding bridges and bridging. First, we describe specific holonic and synthesising qualities of bridges and bridging as inter-relational practices. In our view, a holonic understanding is helpful for seeing how dualistic perspectives and approaches are partial or at least limiting in their impact. Specifically, a holonic perspective is one that adopts a systems view of nested relationships between the system's elements (Checkland, 1988). In other words, holons are constitutive 'entities' that are both wholes and parts of bigger wholes at the same time (Koestler, 1967). This means that holons are simultaneously autonomous and dependent, as they are characterized by differentiation (generation of variety) and integration (generation of coherence). This permits both analytic and synthetic approaches to be taken towards understanding organisational phenomena. Accordingly, a holarchical system refers to a nested hierarchy/heterarchy of holons (Edwards, 2005). As a form of organising, such holarchical order is especially relevant for the increasing number of decentralized, self-organising processes and its theorising.

A holonic understanding of bridges and bridging is useful for the non-reductive integration of different conceptual lenses. Such approach enables portraying complex realities and relationships involved in bridging diverse phenomena and dimensions in organisation theory and practice. Methodologically, using a holonic orientation and its integrative potential, demands a comprehensive multi-level analysis that takes subjective, inter-subjective and objective dimensions of bridging into account. Interrelating different and specific, but interconnected, processes of interior and exterior as well as individual and collective dimensions, accommodates relevant perspectives of what an 'appropriate' integrative bridging requires. Such orientation provides a base for understanding the syn-integral qualities of bridges as mediating and dynamically synthesising various theoretical and methodological perspectives in MOS. This syn-integral orientation contributes to overcoming the isolation of opposed positions as well as the prevailing practical and methodological reductionism (Küpers and Edwards, 2008).



As shown in Figure 1, we suggest that the metaphors of bridges and bridging can communicate synintegral meanings that are increasingly relevant for MOS as they contribute to overcoming the isolation of opposed or compartmentalized positioning, because bridging connotes connection without subsuming one locality into another. Figure 1 depicts how bridges form networks of connection and connecting patterns between views (Cilliers, 2001).

Figure 1: Bridges as links in a syn-integral network of connections.

In this way, syn-integral approaches correspond to the need for overcoming 'dichotomous thinking' with its formation of 'false binary oppositions' (Tsoukas, 2000) and its either/or logic, for example when coping with change (Beech and Cairns, 2001). A syn-integral orientation considers ways on how relational dimensions are 'in sync' to each other, including divergent and convergent dynamics. Correspondingly, syn-integrality exhibits a potential to explore inter-relational and transformational processes with their dynamically interwoven individual and collective agents and agencies in organisational life-worlds.[8]

Close to this syn-tegrality is the cybernetic model of 'syntegrity' (Beer, 1994), which refers to a form of non-hierarchical problem solving in teams particularly through informal talk and facilitation. However, 'syn-integral' bridging, as suggested here, goes beyond the group-level and focus on problem-solving, as it tries overcoming the limits of the underlying cybernetic system approach. Nevertheless, a 'syn-integral' approach agrees with the basic Gestalt-idea of synergy. For such Gestalt-approach the properties of a whole are greater than and distinct from the added or combined features of the parts.

'Syn-integrality' resonates in particular with the idea of 'tensegrity' as this concept refers to the integrity of structures as being based in a synergy between the inseparable and balanced components of tension and compression (Fuller and Applewhite, 1975). Accordingly, a 'syn-integral' orientation follows Buckminster Fuller's architectonic principle of efficiency in the construction of design of things. 'Syn-tegration' achieves maximum stability, robustness, and quality of outputs with a minimum of inputs, thus doing more with less. Instead of using compression, 'syn-integral' bridging achieves stability by the distribution and concurrent application of tension and pressure on the entire bridge and in relation between its poles. Thus, the integrity of the structure is determined by the distributed tensile stress of the entire system. This tensile integrity or in short 'tensegrity' is summarized as "a structural-relationship principle in which structural shape is guaranteed by the finitely closed, comprehensively continuous, tensional behaviours of the system and not by the discontinuous and exclusively local compressional member behaviours" (Fuller & Applewhite, 1975, p. 372).

'Tensegrity' has many suggestive implications for more effective configurations (Judge, 1979). Such tensile structures make explicit the value of having discontinuous or antagonistic relations between concepts embedded in a continuous mutually supportive network of relationships. As dynamic figurations they reveal how an appropriate combination of properly positioned elements can give rise to a totally unsuspected structure of stability. Interestingly facilitating communication between all parties involved in these structural configurations is not the only way forward, even if it seems feasible in practice. Furthermore, tensegrity suggest that much may be accomplished by ensuring a supportive relationship with neighbouring nodes. This can be accomplished provided that a position is challenged by appropriate opposing nodes. Remarkable these tensile structures have empty centres. Correspondingly, every point is visible and connectable from every other, suggesting a desirable form of transparency. Critically, this raises questions about and inhowfar it is desirable to whom, and in what sense. For example, open offices, in which everyone is constantly visible to everyone else, may lead to a panopticonism (Bart, 2005). For a tensegrity-oriented approach the centre is a virtual one, rather than being occupied by some dominant body, individual, concept or value. Furthermore, such structures also imply a range of global transformations through which the set of concepts or policies can grow to encompass greater variety.

---

[8] To understand what 'syn-integral' and 'syn-tegral' bridging in particular means it can be critically contrasted to *synergetics*, which represents an interdisciplinary science explaining the formation and self-organization of patterns and structures in open systems far from thermodynamic equilibrium (Haken, 2004). In contrast to this system approach for which self-organization means that a complex system achieves its spatial structure and/or functions without specific interference from agents outside the system, 'syntegral' orientation includes the possibility of active agency. Although being part of a holonic embedding system, individual and collective agents can be bridges and actively bridge between elements.

While tensegrity – the simultaneous occurrence of tension and pressure – can be observed in nature, applying the principles to social systems, like organizations, may lead to a 'synergistic tensegrity' or 'syntegrity.' Such integrity, as being 'in tensile sync' enables an optimum cross-linking between parts, e.g. members of a team, who are sharing knowledge.

Moreover, an optimum-orientation towards syn-integral connectivity includes also disconnectivities, for example interruptive agentic acts in mediated work (Wajcman and Rose, 2011). Thus it considers conflictual dis-connection within the inter-relational spheres in which they occur. Therefore syn-integral bridging does not follow the ideas of a metaphysical harmony, nor an underlying unity-oriented ideal(ism). Rather, it embraces demands of diversity, complexities, intricacies and ambiguities of bounded organizational realities as well as its theoretical and empirical investigations. Such an orientation towards integral passages in the spirit of 'syn-integral ity' allows not only dealing with conflicts, dilemmas, paradoxes and pathologies of organization in a creative way. It also contributes to a more comprehensive rendering of individual, group-related and organizational sur-plus within a 'bounded integrality' (Deeg et al., 2010).

Taken all together, a holonic and syn-integral bridge-building represents an adequate meta-theoretical and practical approach for recognizing and dealing with multiple perspectives, while being open for productive irritations, and creative responses. Furthermore, it enables a more effective and sustainable 'trafficking,' in that it provides a base for meaningful communications and bridging between various interdependent realities in organisations and beyond.

Bridges and Bridging the In-between… Bridges on the Move

Based on the outlined integral, holonic and syn-integral orientation, the following analyzes some perspectives on the role of an inter-relational 'space in-between' (Bradbury and Lichtenstein, 2000). On the one hand, integral and syn-integral qualities of bridges and bridging are themselves mediating in-betweens. In this way, bridges not only bridge between, but also create an *in-between.* This in-between can be interpreted as a bridging milieu, a sphere and process in and through which the bridging takes place. Applied to organisational theory and practice, this in-between as bridge is co-constituting and entailing as well as enabling to inter-relate multiple realities and individual and collective dimensions in organisational life-worlds. This liminal bridging moves between concepts, categories and paradigms of thought and forms *of* practice not 'in' them (Chia, 1996, p. 142). It is this relational realm of in-between, with its gaps or interstices and therein unfolding 'in-tensions' (Cooper and Law, 1995), which is the medium for meaningful syn-integral theories of organisations. Moreover, the in-between – interpreted as ongoing processes of becoming (Tsoukas and Chia, 2002) – serves as the source for creative and social experiences and realities. By recognizing the primacy of relational processes, these become 'form-in-media' (Küpers, 2011), in which bridges are continuously co-created and changed in the course of being built and functioning.

Corresponding to these perspectives on the in-between, the metaphors of movable bridges and flowing bridging can be used for illustration. These process-oriented images refer to alternative forms/media-connections in that they reveal or re-present organizational processes as relational, emergent patterns of association, accomplished performances or as ongoing movements (Putnam and Boys, 2006; Taylor and van Every, 2000). For thinking of bridges and bridging as moving media, ferries come to mind that, while serving as moveable transport vehicles, often replace stable bridges. Or we could think of air-bridges that function as movable connectors for passengers.

Following Deleuze and Guattari (1980), emerging ‘rhizomatic bridges’ can be thought of that allow multiple horizontal and mutual connections that are growing into swinging radial ways. Importantly, a rhizome-bridge has no beginning or end, but is always in the middle, between things. With these qualities, any point of a bridging rhizome can be connected to any other (Deleuze and Guattari, 1980, p. 7). Thus, rhizomatics reinterprets bridges as dynamic, heterogeneous and non-dichotomous, open-ended places, pathways and lines of flight that is de-territorialized structures, through which nomadic movements can take place (Chia, 1999).

When engaging with metaphors of moveable bridges it may make bodies, feelings and thinking move, thus serving as media for reflecting ‘beings’ and facilitating different forms of becoming, that is, unfolding, emergence and transformation (Tsoukas, 1991). As being inter-relational milieus and processes, bridges and bridging moves are spheres and practices of transition. Bridges become living third spaces, inter-places and zones of “interplay” (Schultz & Hatch, 1996) in contrast to being static positional or instrumental resources. Accordingly, as spatial and temporal in-between, bridges and bridging serve not only for coming from one point to another, but help to overcome thinking in points at all. Subversively, they are inviting, guiding, going to, and dealing with post-dichotomous in-betweens of theorising and practicing organisation. When in-between spaces of bridges are those, ‘where differences unfold differences, in-between, inside-outside, formal-informal, old-new etc.’ (Clegg and Kornberger, 2006, p. 154) occur, then considering requisite suitable levels of connectivities[9] and bordering or borderland strategies suggests metaphorical borderlands, particularly for reconnecting of theory and practice (Tyler, 2009),[10] open up for more creative forms of organising.

---

[9] “Requisite connectivity is the state of having robust and reliable communication and/or transportation media/modes, with operable alternative work-around options, so that contact may be initiated or maintained at the rate, richness and intensity that we desire for a given task or social outcome” (Kolb, Collins and Lind 2008, p. 182). Accordingly, requisite connectivity refers to a threshold state of having an appropriate level of connectivity, one which enables effective performance of a given task or social outcome. It marks a middle ground and can be distinguished from states of too little or too much connectivity. At the one extreme is a state of hypo-connectivity, where there is insufficient connectivity for the demands of the situation. For example, in distributed teams when teleconferencing facilities are not available, and/or time differences and geographical distance make face-to-face contact problematic, a team may report suffering from hypo-connectivity. The other extreme is a state of hyper-connectivity, in which high levels of connectivity are detrimental to performance. As such, effective and efficient performance requires that individuals, teams and organizations achieve and maintain a state of requisite connectivity, while avoiding the pitfalls of the two counterproductive states of hypo-connectivity and hyper-connectivity.

[10] Instead of using binary, two-shore-oriented metaphor of gaps and bridges, Tyler (2009) suggests metaphorical borderlands particularly for reconnecting of theory and practice. Following Anzaldúa (1987), the concept of a borderland refers to a psycho-social territory, which span and include the boundary, thus

Such a radical understanding of the relationality of bridges as dynamic connectivity helps understanding practices of organising as decentred inter-relationships. Interpreting organizational phenomena as dynamic constellations of relationships allows us to see that they cannot be substantively fixed. Organisational spaces are connected via shifting clusters of variable elements throughout a non-centred, configured lattice. This distributed mesh processes what could be called 'inter-bridging' that is moving in dynamic sets of forms and relations within an 'inter-world' as a shared 'inter-mundane' place (Merleau-Ponty 1995, p. 269). In turn these formations and relationships are situated within and influenced by powerful historical, embodied, emotional, cognitive, social, and structural dimensions.

Conceptually and practically, such 'inter-bridging' provides renewed possibilities for developing richer, more contextured understandings and transformative enactments of holonic and syn-integral processes in organisations.

Implications for Organization Studies

The integral and syn-integral metaphor of brides/bridging challenges the commonly assumed status of incommensurability among MOS research paradigms. It enables perspectives of interplay and connectivity that transcend the incommensurability argument. Opposing approaches can be considered by juxtaposing them which illustrates their representational nature and logic. By encompassing various research directions, a syn-integral approach, as outlined before, provides a more accommodating framework that corresponds and helps to respond better to the plurality and complexities of organizational phenomena, including discontinuities (Deeg, 2009). In this regard, syn-integral thinking may reveal connections of seemingly disparate, but interdependent facets of issues under study. The syn-integral nature of bridging metaphors offers pathways for overcoming binary arguments in which 'either-or'-antinomies foster sub-complex black-or-white views. Instead, a post-binary syn-ingral approach sees opposite orientations as co-determined, as mutual, complementary and interconnected positions. A re-examining and questioning of fundamental assumptions of various practices and theories from a syn-tegral perspective, enhances forms of unfoldment and learning that elevates theory-building. This in turn may protect researchers from becoming trapped within an isolationist view or a limited range of conceptual possibilities. The very move of crossing diverse boundaries represents is an actual practice of (meta-)theoretical bridging. By unearthing connections and establishing new ones (Molz and

---

helping (a mestiza-consciousness) to dissolve, rather than overcome dualities. For a borderland perspective "the bridge is replaced by buoyancy, by flow" (Tyler, 2009, p. 533). In this borderland contradictions are sustained and become a creative force for new connections between people and ideas. Furthermore, the borderlands metaphor possesses creates and atmosphere and has the "power of sustainable engagement, a mixing and a blending that results in the emergence of novelty" (Tyler, 2009, p. 532).

[11] Instead of using binary, two-shore-oriented metaphor of gaps and bridges, Tyler (2009) suggests metaphorical borderlands particularly for reconnecting of theory and practice. Following Anzaldúa (1987) the concept of a borderland refers to a psycho-social territory, which span and include the boundary, thus helping (a mestiza-consciousness) to dissolve, rather than overcome dualities. For a borderland perspective "the bridge is replaced by buoyancy, by flow" (Tyler, 2009, p. 533). In this borderland contradictions are sustained and become a creative force for new connections and sustainable engagement between people and ideas.

Edwards, 2015), this bridging endeavour show inter- and transdisciplinary ways to cross, thus to advance creative pathways.

Radicalising the idea of an "inter-disciplinology" (Bahm, 1980) that crosses disciplines and forms of knowledge, such bridge-crossing requires the cultivation of a relational taking of perspective. Such "inter-perspectivity" (Giri 2002, p. 106) is using an inter-relational approach, that includes and interrelates multiple perspectives. To cross boundaries does not mean to espouse a single encompassing truth, to fix the one, supposed best (meta-)orientation or methodology, nor to justify the dominance of a certain worldview. Rather, an integral meta-theoretical research recognizes and values, different levels, pluralism and diversity. Due to its inclusive character, various paradigms, theories, methodologies and insights can then find their place in a broader scheme. Importantly, an integrated meta-theoretical bridging view does not promote eclecticism, but favours a nested holarchy of knowledge. With its meta-paradigmatic orientation and holarchical knowledge, an integrated modelling encourages awareness of theoretical and methodological alternatives. Integral bridging facilitates discourses and/or inquiries and interplays across paradigms, hence fostering greater understanding within pluralist and even paradoxical organizational contexts (Lewis and Kelemen 2002, p. 258). At the same time, bridging between shared patterns and platforms for communication contributes to developing constructive, useful and emancipatory knowledge (Molz and Edwards, 2015). Eventually, such bridging may also help to close gaps between academic research and organizational practice (e.g. Saari, 2007; Kieser and Leiner, 2009; Hodgkinson and Rousseau, 2009).

Conclusions

This paper argues that the bridge/bridging metaphor is a source of multifunctional and generative ideas for investigating organisational life-worlds. With their special syn-integral characteristics that allow traversing not only streams and obstacles, but also polarities and abysses, bridges are well suited to interpreting and dealing with contexts and theories of organisation that are marked by division, oppositeness, isolations or fissures. Traditionally, bridges were not used for staying or living on them, as they functioned only for a purposeful crossing over. Yet, in a reinterpreted sense, bridges are not only for traversing but also serve to overcome barriers and boundaries. They offer possibilities for redirecting the pathways and going towards, living in and dealing with the in-between. Thus, from a holonic and synintegral perspective, bridging modes are vital activities and places for learning about different ways of seeing. Bridges are eminent tropes for transformative process because they highlight dynamic forms of relationalities and movements, which also implies a fundamental fragility and requires malleability. This means that bridges need to be sensible to vibrations and to operate with an oscillatory instability as they are endangered by great commotions. Accordingly, the process of actual bridging is a vibrant, unstable, constantly challenging, and delicate work in progress.[12]

---

[12] This became evident in the opening of the high-tech Millennium Bridge in London, which traverses the River Thames from the Tate Modern to St. Paul's Cathedral by which pedestrians generated lateral and reinforcing momentum called "synchronous lateral excitation" (Cassidy, 2009) causing the bridge to shake and swing. Thousands of people lined up to walk across the new structure, which consisted of a narrow aluminum footbridge surrounded by steel balustrades projecting out at obtuse angles. Within minutes of the official opening, the footway started to tilt and sway alarmingly, forcing some of the pedestrians to cling to the side rails. Some reported feeling seasick. The authorities shut the bridge, claiming

A key point in our discussion has been that metaphors integrate reason and imagination and so are useful for meta-theoretical bridging. Combining postmodern fragmentation and hermeneutic integration (Alvesson and Skoldberg, 2000), metaphors of bridges and bridging provide researchers with the means for building boundary crossing coherence. Yet, this coherence is not found 'out there,' waiting to be discovered, but requires an active engagement of a responsive creation and fluid responsiveness (Rodriguez-Sanchez et al., 2008). Similar to the construction of bridges, which may be provoked by troubling water for laying crossable fundaments, the invention and use of metaphor and metaphorising demands deliberate and coordinated work.

Even more, this effort requires often collaboration from more than one end to another, i.e. being simultaneous, determined from either sides or poles and of the in-between. While bridges are constituted by different components, these bridge-elements may not fit into a coherent whole by themselves. Likewise, 'syn-integral ity' is not solely an emergent phenomenon, but results from composite and coordinated endeavours in conceptualising, designing and enacting, though this sometimes includes unfinished 'bridges to nowhere,' which may have their own unexpected values.[13]

We foresee in future MOS integrative research an increasing use and significance of bridges and bridging in our current times in which conventional orientations, paradigms and approaches are becoming more diverse and fragmented. Bauman (2000, p. 5) has said that "between the overall order and every one of the agencies, vehicles and stratagems of purposeful action there is a cleavage – a perpetually widening gap with no bridge in sight."

The need for new kind of bridges will become more important as not only do identities are getting more fluid, but also as social relationships become transitory, generating anxieties and insecurities, while facing liquefaction as disembedding without re-embedding. In an increasingly liquefied world, unpredicted and unprecedented settings, risks and dilemmatic challenges are emerging that are calling for moving beyond social and economic polarization. This can then

---

that too many people were using it. The next day, the bridge reopened with strict limits on the number of pedestrians, but it began to shake again. Two days after it had opened, with the source of the wobble still a mystery, the bridge was closed for an indefinite period. Some commentators suspected the bridge's foundations, others an unusual air pattern. The real problem was that the designers of the bridge … had not taken into account how the footway would react to all the pedestrians walking on it. When a person walks, lifting and dropping each foot in turn, he or she produces a slight sideways force. If hundreds of people are walking in a confined space, and some happen to walk in step, they can generate enough lateral momentum to move a footbridge—just a little. Once the footway starts swaying, however subtly, more and more pedestrians adjust their gait to get comfortable, stepping to and fro in synch. As a positive-feedback loop develops between the bridge's swing and the pedestrians' stride, the sideways forces can increase dramatically and the bridge can lurch violently. The investigating engineers termed this process Cassidy compares this fragility of the bridge to a rational irrationality, explaining why capitalism is crash-prone.

[13] Not all efforts of bridging come to a satisfying end as there are not only unfinished bridges, but also bridges to nowhere, i.e. bridges without purpose to connect and thus leading to nowhere. Yet some of those non-/post-functional bridges to nowhere became an iconic symbol and thus a new, rather idealistic function. One example for this is the 'Bridge to Nowhere' spanning the Mangapurua Gorge in Whanganui National Park, which became iconic for New Zealand adventure tourism and is now a major visitor destination.

lead towards new vantage-points of insights and nomadic journeys towards shores of experiences in unknown lands. Hopefully, the outlined syn-integral or pluralistic integration and the associated metaphors of bridges and bridging contribute to develop more integrative forms of theorising of and practicing in organisations and crossings the divides between them.

Collaborative Learning Processes in Teacher Training: Benefits and Costs

Ellen Aschermann[1] and Jennifer Klenzan[2]

Abstract: The current pedagogical discussion emphasizes self-determined and cooperative forms of learning. The theoretical background stems from constructivist theories of learning, which interpret social exchange and reflecting on one's learning pathway as crucial points for construction processes. Consequently, self-regulation turns into a central condition for scholarly learning. This includes setting goals, planning and conducting the learning process as well as the evaluation of results. This paper focusses on the processes secondary school teachers use to implement newly acquired knowledge on self-regulated learning in their lessons. By means of qualitative research methodology, we wanted to explore how experienced teachers develop their own abilities for self-determined learning while teaching their own pupils to do so.

Method: In a transdisciplinary research-project between a secondary school and a university, a group of mathematic teachers participated in a two-day training course on self-regulated learning during which they discussed and developed ways to enhance self-regulation of learners. They were then tasked with implementing their newly acquired knowledge during their maths lessons (number of pupils = 270, 4 - 5 lessons per week) with eighth graders in the course of a twelve week teaching period. Two separate groups of teachers were asked to put their newly acquired skills into practice. The first group (N = 6) used a collaborative setting in which tasks, teaching activities and performance reviews had been clarified and discussed within the group. The second group (N = 4) fulfilled these tasks individually without seeking assistance. The teaching strategies were assessed by means of multiple semi-structured interviews and observations of classroom activities.

Semi-structured interviews were conducted with the teachers prior to the training and after 12 and 32 weeks respectively to explore their understanding of self-regulated learning and their experiences during implementation. A thematic analysis approach was used to identify the factors relevant for the implementation from the teacher's perspective. Observation sessions of classroom activities were undertaken four times during the project period in each class.

---

[1] **Ellen Aschermann** is professor for educational psychology at the University of Cologne. She worked on memory and memory development in the early school years and evaluated interview methods for children suitable for forensic settings. Her current research focuses on fostering self-regulated leaning in schools by developing and evaluating teacher training programs.

[2] **Jennifer Klenzan** studied geography and mathematics and obtained a teaching degree for secondary schools. As a doctoral student in the Kölner Graduiertenschule Fachdidaktik she developed and evaluated a teacher training course to improve self-regulated learning in mathematics for 8th graders. This paper amplifies some aspects of her dissertation: "Selbstregulation im Mathematikunterricht gemeinsam entwickeln."

SOME RIGHTS RESERVED

Results: Both groups stated that the focus on self-regulated learning inspired them to change some of their habits in their own teaching. Teachers in the cooperative group increasingly reported a growing awareness for details of their own preparations when planning lessons or grading, more so than the teachers in the supervisory group. In the collaborative group concrete attempts were made to change some organizational factors so that collaboration could continue for a longer period.

Conclusion: The distribution of didactic innovations such as the implementation of self-regulated learning in teaching contexts requires a two fold perspective. Not only the teachers and their individual teaching have to be taken into account but also the school conditions under which the teachers work. The integral perspective on the analysis of these implementation processes proved to be fruitful.

Keywords: Collaborative practices, Cologne action model, Integral theory, professional learning communities, secondary education, self-regulation.

Introduction

Innovations in the education system such as the encouragement of self-regulated learning are normally initiated from the outside when a new curriculum is introduced, for example. Many of these changes to the education system are currently justified by the conclusions of wide-ranging educational studies (cf. PISA). In the past years universities developed a host of projects which serve to encourage self-regulated learning among pupils. In both these cases not the protagonists themselves suggest new ideas, rather external authorities are making the suggestions in line with a “top down strategy” (Gräsel & Parchmann, 2004). This very typical method of changing teaching processes is also known as “Research, Development and Diffusion (RDD)” (Krainer, 2003). What characterizes this classic method is that “there is a human and temporal split between the conception and development of particular innovations and their implementation.” (Gräsel & Parchmann, 2004, p.199). Due to this split it is hardly surprising that further training will in most cases not change teaching practices (Kaenders, 2010).

Gräsel (2010) suggests that teachers working collaboratively are a central feature of successful adopted innovations. Teacher collaboration can therefore be used to integrate the training objectives more effectively during teaching. The evaluation of the cross border model experimental programme “Quality Improvements in Schools and School Systems (QuiSS, Qualität in Schulen und Schulsystemen)” showed that good teacher cooperation amongst the body of teaching staff was the strongest predictor for the spreading of model experiment objectives within the school (Jäger, Reese, Prenzel & Drechsel, 2003).

Krainer (2003) further emphasizes that teacher collaboration processes are ideally accompanied by external support from e.g. university researchers to yield optimal results. In his approach of collaborative research the protagonists with different types of expertise examine and develop their own teaching practices together. Teachers are not considered the passive recipients of scientific research but as experts on teaching lessons. As much as the teachers learn from scientists, science itself learns from them as practitioners. This type of mutually beneficial activity and learning can be viewed as a transdisciplinary approach in action.

Collaborative Teaching Development from an Integral Perspective

Collaborative approaches in teacher training widen the perspective form the interaction between a teacher and her/his class to the interactional and systemic view as a prerequisite for long-term implementation. The following paragraphs will analyze teacher training for self-regulation from an integral perspective. We will focus on Wilber's Integral Theory (2001) in which he developed a quadrant model to describe research processes under the viewpoint of the individual / collective dimension and the internal / external dimension. Wilber's model is based on the concept of Habermas (1995) in which different universal concepts are divided according to their subject area and claims for validity into a subjective, objective and a social world. Wilber broadens these reflections and differentiates between four approaches to cognizance which rest on two independent dimensions inside / outside and individual / collective (cf. Table 1).

The external individual approach to scientific knowledge is directed towards representational or propositional truth. The greatest possible concurrence with objective facts is sought. This view is considered the basis for the empirical (natural) sciences (quadrant 2). A great number of training projects in the educational-psychological discipline can be located in this quadrant. Many of them are developed and evaluated to a high methodological standard alongside international and national educational studies, whose primary objective it is to improve the cognitive and motivational skills of pupils. Within this scope the area of self-regulation deserves particular attention.
